Volume I, Number I.
103 Fulton Street.

FOREST AND STREAM.

ON the fair face of Nature let us muse,
And dream by lapsing stream and drooping wood ;
Tread the dark forests whose primeval ranks
Since the creation dawn have cast their shade ;
Ponder by flowing stream and ocean tides,
And note the varied forms of life they hold,
Mark the wild game so dear to hunter's heart,
The swarming fow' that skim the salty deeps,
The birds that haunt the woodlands and the plains,
The fish that swim the seas, the lakes, the streams,
And tempt the thoughtful angler to their marge ;
Glance at the life that fills our native woods,
And game of Asian plains, and Afric wilds.

When soft May breezes fan the early woods,
And with her magic wand the blue-ey'd Spring
Quickens the swelling blossoms and the buds,
Then forth the russet partridge leads her brood,
While on the fallen tree-trunk drums her mate ;
The quail her young in tangled thicket hides,
The dun deer with their fawns the forests range,
The wild geese platoons hasten far in air,
The wild ducks from their Southern lagoons pass,
And soaring high their Northward journeyings take,
The dusky coot along the coast-line sweeps,
The piping snipe and plover that frequent
The sandy bars and beaches, wing their flight,
And all the grassy prairies of the West,
Teem with the speckled younglings of the grouse,
And all the budding forests and the streams
Are gay with beauty, joyous with young life.

Then swell the first bird melodies ; the wren
Chirrup and perches on the garden rail,
The blue-bird twitters or the lilac hedge,
Or flits on azure wings from tree to tree ;
The golden robin on the apple-bough
Hovers, where last year's withered nest had been,
The darting swallows circle o'er the roof,
The woodpeckers on trunk of gnarled trees
Tap their quick drum-beats with their horny beaks,
The crow caws hoarsely from the blasted pine,
High in mid air the sailing hawk is pois'd,
While from the grove the purple pigeon-flocks
Dart with loud flapping in the grain-sown fields.

Fair is the scene in Autumn, when the frosts
From palettes rich, with prodigal, gorgeous brush
Color the nodding groves with brown and gold.
Then silvery-skied, and purple-haz'd the dome
Of heaven's deep vault, and fair the earth below.
Far up, where sunny uplands scope their sides,
Shaggy with woods, prone to the brimming stream,
Where bowering beech trees shake their laden boughs,
And oaks their varnished acorns high uplift,
Where the broad butter-nut its gummy fruit
In russet husks slow-ripens day by day,
And where in crowded ranks the chestnut groves
Wave out their broad-leav'd pennons to the air,
And from their prickly burs shake treasures down,
There the quick chattering of the squirrels sound.

The gentle valley with its belt of hills
Crown'd to their tops with grand, primeval woods,
Glow with all forms and hues that nature loves.
Deep in its hollow stretch meadows brightly green,
Kept verdurous by the full o'erflowing stream ;
Yet the deep swamps and thickets that engird
The river-reaches, are resplendent all,
Their umbrage tinctur'd with imperial dyes.
The maples tall with blood-red foliage burn,
The hickories clap their palms of burnish'd gold,
The poplar thrusts its yellow spire in air,
The russet oaks and purpled dogwoods blend
Their colors with the alder's sable green,
And scarlet sunnicks ; all contrasted rich
With sombre evergreens, and willows pale.
And when the winds autumnal, wailing strip
The frosted foliage, like a host they stand,
With trailing banners and with drooping plumes.

Such be the scenes in wondrous forest-land
Such be the scenes by sea and lake and stream
That we would picture ; wild romantic scenes,
Dear to the hunter's and the angler's soul.

ISAAC McLELLAN.

ANTICOSTI.

THE JOURNAL. OF A NAVAL OFFICER.

TILL within the last few years, the island whose name stands at the head of this article, has been to the great majority, what may well be termed "*terra incognita*." Heard of but seldom, and then only in connection with disaster, it is perhaps no wonder that the island has from the earliest times acquired an ill-omened reputation, from the long list of ships whose timbers have found a last resting place on its shores, and whose names swell the ghastly record of missing vessels. Situated at the entrance of the Gulf of St. Lawrence, and lying in the centre of the highway of that tide of shipping which sets in towards the lumber mart of the world, it is not a matter of surprise that at the opening and close of the navigable season, the heavy storms which sweep the Labrador coast, and dense fogs which then prevail in those latitudes, coupled with the insidious currents, should lure many a ship within the line of reefs which circle its shores. The mind is however apt to magnify dangers it cannot fully comprehend, and there is little reason to doubt that were the island better known, many of the wild reports, amounting almost to superstition, with which fancy is wont to invest it, would be dispelled. Some forty years ago before the erection of light houses, shipwrecks were of much more frequent occurrence than they are at present, and the tales of suffering which from time to time startled the public ear, and caused the imagination to dwell with horror on the scenes of want and misery enacted on its shores, have done much to keep up the evil notoriety of the island.

In the beginning of this century the only residents were a few trappers who earned a good living from the rich furs with which the island then abounded. The black and silver fox were often met with, and a good skin fetching as much as £40 or £50, the proportionate gains of the trappers can be easily imagined, to say nothing of otter, marten and bear, with which latter animal the island almost literally swarmed. By far the most profitable source of these worthies' income, who in many cases appear to have been little better than pirates, was however derived from the ships cast away on the reefs encircling their buccaneering home. The howl of the storm as it swept down the valleys and moaned fitfully through the pine branches, and the ceaseless lashing of the surf, breaking angrily on the shore, was to the dwellers there music of the sweetest import. They well knew the treacherous nature of the coast, and it was seldom that the morning broke without revealing some scene of disaster. Perchance some had escaped, and hailed with joy the advent of a friend, for in what other light could they regard the stranger who now approached. In many cases fortunate were those who perished midst the roar of the tempest, rather than live and learn the savage cruelty of man. Too often, alas, there is reason to believe that many a life spared by the elements, was sacrificed to the cupidity of the wreckers. In those days, when the loss of a vessel could only be known months after its occurrence, there was absence of proof, and the length of time which had lapsed since the fatal day soon stilled the rumors of bloody deeds which were now and then whispered abroad.

It was not till the year 1829 that the government of Canada was roused into activity by the general consternation which was displayed when the news of the loss of the "Granicus," with all hands, and the almost incredible horrors undergone by those who had escaped shipwreck only to meet a more horrible death, became known. Towards the end of 1828, anxiety began to be felt for the safety of the "Granicus," a large ship on her passage to Quebec, and as the winter months rolled on, and no tidings reached those who anxiously awaited some loved one's return, she was probably put down in that long list of ships which have foundered in mid ocean, and whose fate must for ever remain a mystery.

In the latter end of March, or beginning of April, of the following year, some sealers cruising in the vicinity of Fox Bay, on the north-east side of the island, were astonished at seeing a "Jacob's Ladder," hanging over the side of a limestone cliff near the head of the bay. In such a spot so strange a sight denoted something unusual, and pulling hastily ashore, the sealers discovered that the ladder was securely fastened at the top of the cliff. To ascend was the work of a few minutes, when they were startled by the scene before them. A number of rude huts and tents stood on the summit, and as they examined each, and no sign of human life appeared, and all seemed bare and deserted, the question presented itself to their minds, where could the occupants be. It was soon answered. One small square hut still remained to be examined, and as they tried to raise the latch, they found it barricaded from within. Surely here at last they would discover some sign of life, or at all events something to throw light on the mysterious surroundings. Hastily forcing the door and pressing in, the sight that met their gaze was one not easily forgotten. Before them sat the skeleton of a man, with a ghastly grin, as if to welcome these visitants to the abode of death. That which invited their attention however, and made the blood run cold and curdle in their veins, was a deep pit in the centre of the floor. In this lay the remains of a human trunk, the head, legs and arms having been previously cut off, while the blackened and charred appearance it presented told only too plainly what the ashes beneath confirmed. No diary or any record was to be found, though from a rude kind of calendar on the wall they were led to believe that the unfortunate occupants had survived till the end of January. Two skulls and a few bones were all that remained in the other tents, though, from the number and size of the latter, the greater portion, if not all, of the crew and passengers must have been saved. One tent a little apart from the rest showed by its better construction and a few articles of apparel that it had been inhabited by a lady, the only female on board. The horrors and sufferings undergone by these unfortunates baffled description. We can picture them when first wrecked, probably towards the latter end of November, thankful at their merciful escape and busily employed in building huts and tents for their shelter. If they were not cheerful, at all events they were tolerably contented under the circumstances, and perhaps thought of the time when they should look back, not without some feeling of pleasure, at their sojourn as castaways. As the winter days closed in, and the cold snow and bitter frosts descended, seizing everything in their icy grasp, we can still picture them as first awakening to the sense of their danger ; but as the days and weeks rolled on, and they saw their scanty stock of provisions dwindling rapidly away, straining their eyes far out to sea, for help, from whence no help can come, it is difficult to realise the awful feeling of despair which must have seized them. While "life remains there is hope," is an old saying, but the reverse is very often true ; so long as the flame of hope burns, no matter how small and flickering the spark, all is not over ; but once extinguish it and let in despair, and the rest is quickly told. One by one their little numbers melted imperceptibly away ; starving, their bodies numb and paralysed with cold, their minds worn out with weeks of mental agony, all hope of succor vanished, and in mute despair, they lay them down to die. The snow forms their shroud, and the plaintive moaning of the winter blasts as they sweep through the pine tops, their funeral dirge. Now at last we might suppose their troubles were over, and that their fleecy covering would keep them pure and safe in its close embrace, but even yet they are not suffered to rest in peace. The bears root out the corpses, and fight and scuffle for the prize, and soon a few bones are all that remain to tell the tale of woe. The skeleton found must have barricaded himself in to resist their attacks, and then commenced his awful work of cannibalism ; he had apparently fallen lifeless before completing the act, and so been mercifully spared that additional horror.

When the news of this disaster reached the main land, the government dispatched an official to investigate the matter,

and report on what steps could be taken to prevent a repetition of such scenes. The gentleman who went in charge happened to know, and he has told me that so numerous were the bears at this time, that he has seen men cutting up the carcass of a whale on the beach, actually obliged to leave their work and beat them off.

From this time dates the establishment of Provision Posts, which were built at different parts of the island; one at Fox Bay, near the scene of the wreck, another at Gamache, or Ellis Bay, and a third at Shallop Creek. These have been since added to, and at the present time besides the above, there are stores at West Point, South West Point, and East Point. Boards were also nailed to trees, or posts, in conspicuous positions near the beach, with the distance to the nearest provision depot, and direction east or west leading to it, marked upon them. These have done much to alleviate distress, while the construction of light houses which followed soon after, has greatly diminished the number of wrecks.

During the summer of last year a hunting party was organized for the purpose of visiting the island, and the writer of this article was invited to join. The opportunity was one not to be lost, so applying for two month's leave of absence, which was granted not without some little difficulty, he proceeded to meet them. From several causes the starting of the expedition was delayed until it finally was broken up. Mr. De Courcy and myself, however, determined not to be done out of the trip altogether, and resolved to spend a fortnight there. My leave would not admit of a longer stay. We started for Gaspé in Canada, where we hoped to hire a schooner, and Indians to take us across. Here again fortune was unpropitious; we were two days delayed in obtaining a vessel, and, when at length we did get away, were three days in going a distance we should have accomplished in a few hours. We were anxious to see as much of the island as possible, but as the short space of time at our disposal would not allow much shooting and fishing combined with rapid traveling, the object of our trip, as regards sport, was almost nil. In many other ways, however, it proved most enjoyable. If, in the following imperfect sketch, the writer can give some idea of the wild, weird island, with its low spruce-clad shores, and picturesque quiet bays and inlets; of the fertility of its soil, which in many places is quite equal to the best in Canada; of the bright bracing climate; and if he can in any degree dispel some of the gloom and popular aversion with which the mention of the island is invariably associated, he will be more than satisfied.

Having prefaced thus far, let us now take a glance at the quiet village of Gaspé, and follow the preparations there being made for the trip. Situated at the head of a noble bay to which it gives its name, the village lies nestled on the slope of a hill overlooking the south-west arm of the harbor, which here forms a basin shut in by mountains on every side. Some of these, sloping gracefully backward, are cultivated almost to the summit of their greatly rounded heights, whilst others, clothed to the base with pine and spruce, descend abruptly to the water's edge. Here and there picturesque cottages with gabled roofs, and green jalousies, each surrounded by its well trimmed garden, dot the surface of the hills, and the landscape is one of quiet but exceeding beauty. The town and neighborhood of Gaspé appear to have sunk into a kind of Rip-Van-Winkle torpor, which perhaps has its effect in contributing to the still and peaceful feeling which pervades the very atmosphere. Fifty years ago probably nearly as many houses might have been found as there are at present. Of town, or village, properly called, there is none. A few wharves, with large wooden blocks of store houses, two or three shops which combine under one roof the grocery, hardware, and drapery business, in the most wonderful manner, (the Post Office, by the way, forms part of one,) a small wooden hut which serves as a telegraph station, and we have its extent. As one contemplates the grass-grown kind of square in which these stand, and the deserted aspect of the wharves, he is forced to ask whence springs the source of that quiet ease and snug air of comfort which is to be seen in the surrounding homesteads. Visit the place a month later and the problem is solved. As the close of the fishing season approaches, and the boats return from their summer cruise, an amount of stir and bustle not often seen may be noticed. As schooner after schooner discharges her cargo, and the vast store-houses are filled with cod, only awaiting transhipment to be carried over the navigable world, the secret of their riches lies revealed; the only thought that suggests itself is one of astonishment at the demand that must of necessity exist.

We remained here two days, taking up our quarters at the Gulf House, a small wooden building, all doors and windows, pleasant enough in fine weather, but very chill and disagreeable on a wet day. It was clean, and the proprietor we found willing and obliging to the best of his ability, though steeped in lethargy, and perfectly blind to his own interests. During the summer he had from fifty to sixty people constantly boarding with him, and was obliged to hire spare barns and houses to accommodate them. The charges were certainly moderate: five shillings a day included lodging, attendance, and three "square" meals, plain but wholesome of their kind; but the majority of the visitors, merchants with their families seeking a little relaxation and escape from the cramp of hot dusty towns during the summer months, would gladly have paid more for better accommodation and increased facilities for seeing the country. Horses were only to be procured with the greatest difficulty, pleasure boats not at all, and the natural consequence was that people were thrown too much on their own resources.

Possessing as it does so many natural advantages, fine scenery, pure bracing climate, sea bathing, good harbor for boating, and ample scope for the angler or tourist to follow the bent of his inclinations, Gaspé only requires a little American enterprise and energy to develop into a fashionable watering place.

Meantime we ascertained that the "packet," a small schooner which under contract from the Canadian Government carries the mails during the summer, to the settlements along the Labrador shore, was to sail in a few days on her monthly visit, and we made arrangements with the captain to drop us at West Point, Anticosti, which though not a regular place of calling, is often touched at.

Our time was now fully occupied in selecting the supplies such a trip demanded. The forethought of kind friends in Quebec had provided us with an ample store to choose from, and the only difficulty lay in deciding what portion we could take. Space was limited; once fairly started we knew everything must be carried either in the canoe, or on our backs, and so selecting a round of corned beef, a couple of tongues, a piece of bacon, some sauces, and a plentiful supply of flour and tea, indispensable articles on occasions of this kind, we set to work to stow them away. One of our camp kettles held the meat, the other a frying-pan, tea pot, plates, pannikins, and the various requisites forming our *cuisine*. A barrel of beer, a case of claret, and one of brandy, now awaited our approval. Claret was out of the question; beer was a luxury not to be despised; so we put it on one side, together with a large wicker *cruche* of brandy. Our effort, worthy of a better cause, did not meet with the success it deserved, for, as the sequel will show, we had to leave the greater portion of the beer at the West Point light house. A leather case held our bedding, consisting of a light mattress and blanket each, which when rolled up formed a bundle some two and one-half feet long, by one and one-half feet in depth. Our waterproof sheets served a double purpose: during the day a small and portable coversack in which a change of clothes, two flannel shirts, a pair of boots, and two pair of socks were always packed, and at night they proved a most acceptable addition to our bedding. A small package of quinine powders, and a bottle of chloroform constituted our medicine chest, which, with a field glass, and a few toilet necessities De Courcy carried in a small bag over his shoulder. We each took a rifle, and a double barreled gun, a trout and a salmon rod.

Nothing now remained but to procure a couple of Indians and a canoe. Unfortunately nearly all the men were camping far up the river, and could not be summoned under three or four days. Through the kindness of Mr. E—, the harbor-master, we were at last enabled to secure two, and having agreed to pay each of them one dollar and twenty-five cents for the use of the canoe, besides finding them in provisions (for which we allowed them ten dollars), we ordered them to get our baggage and the canoe on board the schooner. Shortly afterwards we received a message from the captain that should the wind be favorable he would start at daybreak. So we turned in early, and slept soundly till about four o'clock, when the deep guttural voice of the Indian under our window warned us it was time to be off.

It was a cold, gray morning; a thick mist hung over the land-locked basin of Gaspé, and in the eastern sky the frost streaks of Aurora were topping the hills. Naught broke the stillness save the cry of the black ducks winging their morning flight far out to sea, and the voices of the schooner's crew, as with a cheery "heave away, haul away," they hove round the capstan. In less than five minutes we were on board the packet, which was lying with her head up the stream. The anchor was already tripped, and as she paid off under the jib, we hoisted the fore and main sails, and with a fair breeze stood out of the harbor.

Let us now briefly glance at the little vessel and her occupants. The former needs little description, being an ordinary fishing schooner of some twenty-five tons. The latter consisted of the captain and two men, natives of Gaspé, fine able-bodied fellows, with honest faces well tanned by exposure to many a winter storm and summer sun. Our party numbered five: De Courcy, myself, Flanigan, De Courcy's servant, an Irishman who had served with him in the —th Hussars, (a great character, and a constant source of amusement to us), and last but not least, the Indians. The nationality of one of the latter was unmistakable. His small piercing eyes closely set together, long coal black hair which fell in straight thick masses down to his shoulders, and dark sallow complexion, proclaimed him a descendant of those children of the forest who for countless ages held undisputed possession over the boundless prairies, and far-stretching mountains and valleys of the vast continent of America. Peter Jockue was a good specimen of his race, lithe and supple, (though from a natural deformity he walked a little lame). Of a gentle and tractable disposition, we had every reason to be satisfied with him. He proved a capital canoe-man, and if any hard work was to be done, was invaluable. Of his companion and foster-brother, Hamilton, one cannot speak so well. He was a half-breed, his father being a Scotchman, and his mother a squaw. He had inherited the fair complexion and curly hair of the former. Of his Indian descent there was not a trace, though having been brought up from infancy among them, he spoke the Micmac language, that of his tribe, with fluency. He was an active man, and could work well if he chose, but was of a lazy, stubborn nature, and on more than one occasion gave us trouble. Peter was a teetotaller, a "*rara avis*" in that respect, drink being one of his countrymen's worst failings. Hamilton, however, fully maintained the credit of his race. Several times we found him "three parts in the wind," though he generally had the decency to wait till evening, when it was not of so much consequence.

Meanwhile the schooner had run along the coast, and was now abreast of Sandy Point Beach, a long, low spit of sand, stretching almost across the bay and dividing it from the harbor, properly so called. Under the lee of this natural breakwater vessels may lie completely sheltered from the heavy swell which at times rolls into the outer bay. On rounding the point we found that the wind was drawing ahead, and we consequently had to beat out.

As we stood across the bay, first on one tack then on the other, we had a good opportunity of observing the scenery and aspect of the coast. On one stretch we headed for the pretty little village of Douglas, which stands on the rising ground at the south side of St. John's river, and where there appears to be more land under cultivation than at Gaspé. The coast from Douglstown to the entrance of the bay gradually rises, and forms a succession of cliffs of shale and sandstone which in many places attain a height of two hundred feet. There are few houses, and the general appearance is bleak and sterile. On the other tack we lay over to the north-east side of the bay; the bold steep nature of this coast thickly covered with the houses of the fishermen. The store-houses in many places are built on some receding ledge half way down the face of the cliff, and the curious zigzag manner in which the "flakes" (platforms of spruce boughs resting on uprights, on which the fish are spread to dry), run along the tops and down the sides of the rocks, is very striking. One of these fishing establishments, some four miles within Cape Gaspé, known as the "Grande Greve," employs nearly two hundred men, of whom the larger half are engaged in fishing, while the remainder work on shore, and superintend the "curing."

The wind had been falling light all the afternoon, and towards evening we found ourselves becalmed outside the bay, some few miles to the north-west of Cape Gaspé. On our left the cape and its range of cliffs rose sheer from the water's edge to a height of six hundred to seven hundred feet, grim sentinels guarding the entrance to the bay—a bleak forbidding coast—the home of countless flocks of sea birds which hovered around us, filling the air with wild complaints, till as the shadows stole down the cliffs and the western sky grew red and warm with the glories of the dying sunset, they betook themselves to its clefts and crannies for the night. In front the low neck of Cape Rozier stretched far into the ocean, with its rocky shores, white cottages and light house glistening in the sunlight, while far behind on the other side of the bay, the softly rounded outline of the Perce Mountain showed clear and sharp against the evening sky.

The distance from Gaspé Cape to West Point, Anticosti, is only seventy miles, and we had fondly hoped to have spent the night on the island. The accommodation on board the packet was not of the best; we had the choice between the "cabin," a small darksome abode, reeking of cod oil and tobacco, and the forehold, which, though not sounding so dignified, was at all events clean. We preferred the latter, and, having had a long day, about eight of us spread our mattresses on a rude kind of framework built round the hold, and rolling ourselves in our blankets were soon asleep.

On waking, about six o'clock next morning, the wash of the water, as it ran along the schooner's side, fell pleasantly on my ear, and as I lay for some minutes dreamily listening to the gentle ripple, which only a single plank separated from my bunk, I was lured into the belief that at last we had a favouring breeze. Vain delusion; on going on deck where one of the crew sat at the tiller we found we had drifted some seven or eight miles during the night, and were now abreast of Cape Rozier. Of wind there was not so much as a breath, but as we rose and fell on a long ground swell setting from the eastward, which told of the storm that had raged in the Atlantic some days before, the water laved the side with each successive roll, and the cause of my deception was apparent.

On returning to the hold I found De Courcy awake, while a shapeless mass of rugs and blankets lay on the deck. A pair of large boots protruding from one part, seemed to indicate that Flanigan had come to an untimely end. A gentle kick at the centre of the inanimate mass was followed by a grunt; a second met with no better success, and it was not till a third, more forcible than the previous ones, had been administered, that a wild apparition shot from under the blankets, and sat upright, with shock head of hair, and half opened eyes winking and blinking in the gloom of his unaccustomed domicile. It was our "*fidus Achates*," who for a minute or two glared angrily at the intruders of his slumbers, until perceiving where he was, he pulled himself together with a—

"Beg pardon, sir, shure I thought it was one of those In-jin devils."

Despatching him to get breakfast ready, we dressed and went on deck, where we were soon joined by the Captain and the rest of our little party.

All day long we lay on deck, listening to tales of adventure by sea and land; of how in the summer of '59, from some cause which could never be explained, the foxes forsook the forests of the Labrador, and were found running along the shores; a strange phenomenon, as they are rarely seen except in winter, when they are occasionally met with sporting on the ice-floes which skirt the coast. Hundreds were killed, and the little schooner in which we now were, had in the short space of a fortnight sailed from, and returned to Gaspé, with over fifty skins, the accumulated value of which (there being a number of the black and silver grey), was over £500. The preceeding winter had been one of unusual severity and the return of the Montagnais Indians in the spring, after their long winter hunt, was marked by sadly diminished numbers. Many of their tribe had fallen victims to starva-

tion and extreme cold. At another time we listened to reminiscences of the camp, and stirring scenes of chase after moose and bear.

As the sun sank in the western ocean, the rocky coast and lofty mountains blended in one indistinct outline. We still lingered on the deck. It was a glorious night, and we sat long, watching the many-hued shafts of the northern lights, radiating from the central orb, shoot in strange fantastic columns across the sky, now brightly flashing, illuminating the whole arch of heaven, now gradually dying away in faintest coloring, only to be again succeeded by fresh tinted rays. The moon had risen high in the heavens,—"gaudentque cadentia sidera somnos"—before we betook ourselves to rest.

Lieut. R. HUTCHINSON POE, R. N.

[To be Continued.]

Wild Fishing Among the Kroos. OFF THE COAST OF AFRICA.

DEAR MR. EDITOR:—

Did you ever go fishing with a shot gun?

This is no conundrum for you to simply "give up," and expect a "sell" to reveal itself in the answer, for *I have*, and have fugged home such noble specimens of the finny tribe as seldom fall to the lot of wandering fishermen. Don't puzzle your brains now by traversing in your memory the grand old sylvan temples of the Adirondacks, nor plunge still deeper into the wilder virgin forests of the "Schoolic Regions" in search of a locality where such perversion of the piscatorial art could be practiced with success. Neither the famed Long Island trout ponds nor the fishing grounds and banks along our sea-coast would furnish a favorable response to such an unusual invocation.

On a wilder, rugged, barren shore, where great masses of naked, rocky hills, bearing naught but an ever-shifting burthen of flying sand, loom up, grey, arid and hot; where the fierce sun of the tropics sends day after day from a cloudless sky its scorching beams, to burn, wither and destroy utterly all trace of life; where man dwells not, nor beasts sojourn; there, on the land where all is wrapt in the solemn silence of an African desert, Nature still maintains a balance, and, driven from the inhospitable shore, animal life seeks the all-embracing ocean, and the blue waters beating on the rugged beach fairly teem with animation. Fish of all sorts, sizes and descriptions abound, from the mammoth whale down through all grades of size to the tiny sardines, flying in countless thousands from the pursuit of voracious enemies. Away up in a sheltered corner of this beautiful bay extends for a mile a pure white sandy beach, which preserves for rods its gentle slope. There our Kroo-boys haul the seine. No rocks nor coral reef to tear the yielding meshes, but a smooth, sloping floor, soft and pleasant to their bare feet as they wade about or stand each like an ebony Hercules. With the strength of Titans they make sport of the heavy haul as the cork beacons come, one after another, closing in and narrowing down that as yet unexplored centre—centre of all our thoughts, hopes and wishes.

With shouts and songs and wild and savage dances of joy and excitement, the net comes slowly in, and fathom after fathom is piled upon the beach. Then the huge bag, with its glistening, quivering, springing mass, comes surging into view. Like a roll of moving quicksilver seems the glimpse we catch of the contents of our trap. Until this supreme moment "Black Will" and "Tom Limerick" have preserved their dignity. They are "Head Kroomen," and get a dollar each more, monthly, than the others. They feel to the utmost the pride and dignity of rank, with more wages, more brains, more strength, more wives than all the rest together, and with more gay silk handkerchiefs treasured up in their dirty bags since our visit to St. Helena. Each handkerchief is destined, without transformation, to furnish a complete suit of clothes to one of said wives. They have so far played the officer and directed; now they spring to it with a will and encouraging shouts, and the great muscles of their chests and arms swell into cordage in alto-relief as they add in their powerful assistance.

And so into the shoal water comes the silvery mass, struggling helplessly, and our haul is successful.

But look out! Not quite so sure a thing after all. A sudden, violent threshing and vigorous beating of the water into foam—a quick, momentary dispersion of the Kroomen with shrieks, half in terror, half in fun, and in the deeper part of the net, where he had lagged sullenly back till the last, is seen a great, dark monster, with horrid, greenish eyes and yawning jaws, snapping viciously at the cordage and plunging furiously in his frantic endeavors to escape. Quickly as they scatter, the Kroos gather again and surround the entangled victim. Armed with oars, stretchers and boat-hooks they rain blows upon the writhing form, taking good care though to spring nimbly back whenever in the skurry the fighting end of the shark comes into an unpleasant proximity; blows which would stun an ox, but which upon the monster fish have but a stimulating effect. And see! the net is giving way. Cut, bitten, or broken, an ugly, ominous rent is seen. Should the shark but perceive it he would soon be at liberty.

But now "Black Will" advances. Taller by half a head than the tallest, with thews and muscles of a demi-god, he stands proudly conscious of his skill and power. With a superb gesture of contempt he motions the noisy rabble to fall back. They obey, and, like in the bull ring, when the matador assumes his part, the contest is left to these two only. For a moment the tired shark lies quiet, and with his devilish eye watches his new adversary. "Will," too, is quiet for the moment. With his yellow, bloodshot eye he searches sharply for the vulnerable point. His thick lips,

drawn spasmodically apart, show his great white teeth, filed to saw-like points; his wide nostrils twitch with excitement; his brawny hand clutches a short, sharp-pointed knife, uplifted for a blow. Suddenly, with a whoop that hand is dropped. With a great convulsive quiver the huge fish straightens out and is quiet, and the well-directed blade is buried in his neck, where, between the vertebrae, there is one weak point that Will's unerring thrust has reached.

Here and there a sudden dense blackness comes clouding up from the bottom, and a space of yards square becomes a pool of ink, into which and from which the frightened fishes enter and emerge and hide themselves from our sight. A huge "Sepia," or cuttle-fish, has been dragged from its lair, and he, too, raises in his defence his only weapon.

But shark and cuttle-fish are thrown out, and our prey landed upon the sand. No great variety, after all. A few flounders and sand eels are sprinkled among the mass, but mullets predominate, and it is well that they can be captured in this way, for they will not take the hook, and are most delicious for the table. We do not count or weigh our catch, for there is beyond all question enough and to spare. The launch and cutters are loaded to their thwarts, and the jolly Kroomen, chanting and singing their wild, native songs, pull slowly off. A big fish chowder, with "yams" and "tarrow" in lieu of potatoes, awaits two hundred men to-morrow.

But I don't see that I have said much about the shot gun as yet. Patience, old friend! you must let me have my own way, and I'll promise it shall come in, in due time. We'll hang the seine to dry, and jumping into the "dingy" pull seaward a short half mile toward that rocky point, where the sterile mountain bathes its stony foot in the sea. Stop when you can see the bottom clearly, and lower your anchor. It is a few feet, you think, but fathom after fathom pays out, and sixty feet of clear, transparent fluid is beneath you as you peer through the liquid depths into a vast aquarium. Now learn the secrets that Nature generally conceals from our sight. Beds of living coral, with green and yellow and white blending one into the other; branches reaching upward like stunted oaks, and bearing strange and unfamiliar foliage; deep crevices, where the greenish water grows blue and bluer till, with its density, the range of vision is arrested; arches and tunnels and labyrinthine paths, through which slowly glide hither and thither, or like meteors dart, strange forms—myriads of fish, of all sizes and descriptions, pursuing the natural tenor of their lives, unscared by the presence of the boat floating so far above their backs—unconscious of their danger because as yet untaught. Huge "gropers" (garroupas), snappers, sheeps-heads, and other rockfish, as yet unnamed, are lying quietly upon the bottom, with but their moving gills, and now and then a slight flirt of a fin, to betray that they live. Little coral fish, crimson and blue and scarlet, flash in and out among the crevices, high up above their mighty enemies, or gathered in groups like gorgeous bouquets.

Bait your hook, carelessly as you choose, with a bit of fat pork, and lower it gently to their level. You see so plainly the clumsiness of your gear—the great hook, the wire snell, the coarse cod line—that, if a trout worshipper, you fear for the result. But in an instant all is changed. Where quiet was, confusion reigns, and from all directions dart swift-motivated forms. The little coral fish, frightened, disappear in their crannies. Your hook vanishes, and a sharp, heavy tug proclaims a strike. As the victim feels the sting of the steel he darts off from the scrambling crowd, and you can see your work before you. The others show an instinctive knowledge that there is something wrong, and dash wildly to and fro. Large fish rush at the stricken one and endeavor to tear him from your hook. Round in quickly, for your tackle is stout, and you have no time for playing. Sharp coral edges will fray your line, or sharks rob you of your prize if you delay. Clap on boys, and haul! up with him, hand over hand! With a heavy surge over the gunwale a great red snapper, full forty pounds in weight, lies gasping and struggling at your feet.

Another bait, a few moments to recover breath, another contest for supremacy, and so on till sunset comes, and sheer fatigue moderates your excitement. Then, with wet legs, frayed clothing and torn hands you realize that hard play can be identical with hard work.

I think I'd better get to "shooting fish" though, very soon, or my letter will be like Artemus' lecture on the "Babes in the Woods," where he introduced every imaginable subject except the babes. It didn't amount to much, after all; and in reality, as in this letter, I never bothered with the gun till I had caught my fill with the line. But sometimes at low tide the fish were not on their usual bottoms, and the hook and line gave but poor results. Then we would station ourselves outside the line of breakers, where, from the rocky points extended great tables of flat reef, the surface of which was broken up and had many hollows and pools, left filled by the receding tide. In these comparatively safe retreats multitudes of small fish were gathered. The big fish knew it, and all along the edge they lay in wait. Now and then a little higher wave would for a few instants flood the rocky table, and on its crest the great gropers and snappers would rush headlong in, and if, perchance, they struck a pool, remain monarch and eagerly devour its inmates. As often, though, they missed their aim, and the receding wave left them flapping and kicking about on the rocks. Then was our time—a quick snap shot, and the reflux wave bore to our grasp such monsters in size as often puzzled us to secure.

Com. L. A. BEARDSLEE, U. S. N.

GUY FAWKES AND HIS FATHER.

BY the kindness of Mr. Bartlett, I have had the good fortune to be present on the occasion when the little Hippopotamus, Guy Fawkes—who is now eight months old—was introduced to his disagreeable old father, Obesh, a resident in the gardens for twenty-three years. Obesh was quietly munching his breakfast of grass in the outside den, when at a given signal the portcullis of the mother's den was gradually raised, and the two heads appeared gazing out with a most comical expression. Seeing his wife, the old man left off munching his grass, grinned a ghastly grin, and he loudly trumpeted "Umph," "Umph," "Umph."

Little Guy Fawkes then came forward from behind his mother, with the action and stiffness of a pointer when he has discovered a covey of birds; gradually and slowly he went up to his father, and their outstretched noses were just touching, when the old woman sounded the signal for war, and rushing past the young one, fairly challenged her lord and master to single combat. He instantly retreated a step or two, and his wife began to pretend to munch at the grass, keeping her eyes always fixed spitefully upon him.

Just at this moment the sun shone out, and I was enabled to see most distinctly the remarkable phenomenon of the "blood-sweet" of these gigantic animals when excited.

The usual pale chocolate color of the skin of the husband and wife became densely covered with spots that looked like thin red gum, and when the male turned his head I could see that these spots were globular; they glistened like dew on a cabbage, and stood high upon the skin like blood-stained diamonds. I managed subsequently to wipe off one of these globules, and it stained my note-book quite red. After gazing at each other for about half a minute, old Dil, for that is the female's name, made a savage rush at her husband, and simultaneously both animals reared right up on their hind legs, like bulldogs fighting. They gaped wide their gigantic mouths, and bit and struck and lunged at each other savagely, while the grass fell out of their great coal-scuttle mouths on to the battle-field. The crash of their tusks coming together was truly Homeric, and reminded me of the rattle and smashing clash—only exaggerated—when the Windsor Park red-deer charge and fight with their horns. For a second or two these two gigantic animals closed together and swayed to and fro like Cornish wrestlers. This scene of the Hippopotami fighting was grand in the extreme, and would form a good subject for an Oxford prize poem or the pencil of Landseer. When they settled on their four legs again the old woman followed up her advantage by giving her husband a tremendous push "well hit" with her head, and while the cowardly old fellow sneaked backwards into his pond, his wife trumpeted a triumphant signal of victory from the bank. All this time little Guy kept well in rear of his mother, occasionally peeping round her sides to see the rare and extraordinary phenomenon of a husband and wife having a row. Dil then slowly, and in a Shah-like manner, walked down the steps into the water, and hunted the old man about until she drove him up into a corner, she then mounted sentry over him. The young one then mounted on to his mother's back, and gazed with filial respect, not unmingled with impudence, at his father. At the least movement on his governor's side, he sank down into the water as quiet as an otter, without making the slightest ripple or sending up a bubble of air, and shortly re-appeared with his pretty little head, erect ears, and bright eyes, and looking like a gigantic frog. During his subaqueous excursion the little rascal had probably gone up to and touched his father, for the old fellow gave a sudden plunge and jump as if he had been touched up from underneath by something alive. Thus the three remained for about half-an-hour, grunting and staring at each other. Obesh made one attempt to get out of his corner and retreat into his den, but his artful old Missis was two quick for him, cut off his retreat and drove him back. The little one, I observed, always kept the far side of his mother, in case his father should turn rusty again. In about three-quarters of an hour the row was all over, and instead of angry trumpetings, the signals gradually assumed a more amicable tone, and it was evident that the two Behemoths were getting into good temper. At last the female swam nearer to her husband, and distending her great nostrils to the utmost, uttered a kind of hiss, not the least like a war cry. When the keeper heard this he said, "They are all right now, Sir; they'll not fight any more. See, the old man's beginning to smile, and he has uncocked his ears and left off staring." The faithful keeper was quite right, for all three Hippos at once became friends, and the domestic row was over.

I understand that on the previous day, when these three beauties were first put together, that little Guy Fawkes immediately went up to his governor, and checked him in the most insolent manner; he bristled up, grunted at him, showed his teeth, and actually challenged his father to fight. The mother then charged the old father, scratched his face, and pushed him right bang all of a lump into the water. The little one followed up directly, swam under his father's legs, and actually bit at and pulled the paternal tail. On the second occasion the youngster behaved very differently; it was quite evident that somehow or other his mother had cautioned him and given him orders to keep in the rear while she fought her old man. On this occasion Obesh was terribly alarmed, although his wife frightened more than hurt him. She so alarmed him that a new discovery was made by Mr. Bartlett. After the row was over the cowardly old Obesh changed color. His mulatto-colored skin got gradually whiter and whiter, and the lower part of his head and sides became of a creamy-white tint, and the poor old fellow looked "as white as a ghost." It was some hours before he came to his proper color again. When his wife gave him a hiding on the second day Obesh again turned somewhat white, making his blood-spots stand out with unusual clearness. Now that this family scrimmage is over, we trust that for the future they will enjoy domestic felicity.

By the way, the controversy has not yet been decided whether the present name "Hip-po-po-ta-mus" (which means a horse-river, not a river-horse), shall not be recast into Potamippus, and the little Guy Fawkes received a new appellation—the diminutive of the original word—viz., "Hippopo-tamidon," or "Potamippodion." This, as your correspondent Mr. E. K. Karslake remarks, "would be barbarous." I should like to hear a stammerer tackle it.—FRANK BUCKLAND, in *Land and Water*.

A Cincinnati editor, who has indulged in a heavy life insurance, is said to be followed, whenever he goes a fishing, by several life insurance companies, affectionately bearing life-preservers and sun umbrellas.

For Forest and Stream.

THE PRE-ADAMITE.

HO! for a rhyme of the good old time,
Ere Adam or Eve was born,
When the saurian slept in the sluggish slime
With the unique unicorn;

When the mermaid smiled on the mammoth mild,
And the Dodo sang her lay,
And the behemoth breasted the billows wild
With the plesiosaurus gay.

Oh! a happy wight was the Pre-adamite,
He basked in the griffin's smile,
Or followed the dragon's dizzy flight,
Or angled for crocodile.

Then an omelette, made of the roc's eggs, stayed
His appetite so rare,
While whale on toast, or a walrus roast,
Was his daily bill of fare.

No hotel bills or doctor's pills
Impaired his appetite;
He laughed at gout, with his stomach stout,
And kept his molars bright.

Ho! a tear and a sigh for the days gone by!
And a dirge for the doughty dead!
Let the sea-serpent shuffle his coil, and die;
For the good old days are sped.

J. J. ROCHE.

Trout Tails from the Nepigon.

T A L E I.

RED ROCK, LAKE SUPERIOR, July, 1873.

EDITOR FOREST AND STREAM:

When I saw the prospectus of your new newspaper enterprise, I congratulated myself and the public; for now I know we shall have a paper which will furnish just the kind of information which we sportsmen have long needed and looked for in vain. Excuse the flattery—but I have learned by experience that the man who wrote that, to us useful book, entitled "*The Fishing Tourist*," is well informed of what he writes. I feel assured that he is entirely competent to take charge of just such a journal as we expect the "*FOREST AND STREAM*" to be, and that under his management it cannot fail of complete success—for which I pray.

Following the instructions printed in the book above mentioned, I have visited the Nepigon river, and cannot but express myself delighted with the careful accuracy of the information given, and more then satisfied with my trip and the attractions of this remarkable river, and its marvelous fish and fishing. Nay, it is more than marvelous. I only wonder that the author should not have given to its pages minuter details, which could not have failed to enchant the reader and enhance the value of the book.

Let me premise what I have presently to say, by the statement that during my ten day's sojourn upon the Nepigon, I took perhaps one hundred speckled trout, (I might as well have taken a thousand) scarcely one of which weighed less than *three pounds*! And to convince your incredulous friends that they are the genuine *salmo fontinalis*, I forward herewith a couple of tails of fish that weighed nearly six pounds each. I saw one trout caught with a hook by a surveyor of the Canadian Pacific Railway, (one of whose routes is laid near this place), which weighed *eight pounds*! These facts fully substantiate the truth of the "*Fishing Tourist*." If they do not sufficiently whet the appetite of the genuine sportsman who has courage enough to come out and rough it, I will amplify hereafter. In this letter, however, I shall merely give a brief outline of my journey and of the river, adding some incidents of personal adventure and experience in other letters which will follow.

Imprimis, I purchased a through ticket from New York to Toronto, *via* the Erie railroad, and in seventeen hours found myself at Niagara Falls. Thence four hours to Toronto by boat—preferable to railroad, after a sufficiently long journey by land. At the Rossin House I was most hospitably entertained by the Messrs. SHEARS, father and son, the proprietors, not more by the good provender provided, than by their congenial and very intelligent intercourse and information upon all subjects interesting to our fraternity of sportsmen. These gentlemen are recognized as among the most thorough sportsmen in Canada, which is saying a great deal; for, assuredly, for rough, practical, intelligent work, the Canadians much excel the majority of our sportsmen in the States. Any honorable, fair-minded man without prejudice, will acknowledge this. The latch-string of the Rossin House always hangs a long way out for "thoroughbreds."

There is a Shooting Club in Toronto, which numbers two hundred members, besides a yacht and boat club, and other minor clubs. The Shooting Club at Niagara Falls, of which Mr. J. B. King is President, comprises some forty members of excellent grit.

From Toronto there is a choice of routes either to Collingwood or Sarnia, whence good boats run to Sault Ste. Marie, and from there, the first to the north shore of Lake Superior, and the other to the South Shore, touching at Marquette and other points, and on to Duluth. The North Shore steamers connect at Prince Arthur's Landing with other boats for Duluth, one hundred and forty miles distant. A favorite route for Americans is from Buffalo *via* Lake Erie to Detroit, and thence through Lake Huron to Sault Ste. Marie. Residents of States west and north of New York, will naturally make Detroit their objective starting point. Of the

two routes from Toronto I chose the Collingwood, by your direction, and purchased a round trip ticket for thirty-five dollars gold, which includes meals and stateroom. The fare from New York to Toronto is eleven dollars fifty cents; so that the cost of the entire trip from New York and return is about sixty-five dollars currency. The actual running time of the trip occupies ten days. One cannot complain of the expense. I am explicit in giving information because I hope gentlemen will avail themselves of it, as August and September are the best months for fishing the Nepigon.

The distance from Toronto to Collingwood is ninety-six miles by the Northern Railroad, and I was surprised to find the route lying through a populous and rich country, with substantial farm houses and extensive saw mills at intervals along the whole line. The appointments of the railway are first-class, and the station houses models of neatness and beauty. Nearly all have tasteful flower gardens and lawns attached, with jets of water spurting from fountains that cool and refresh the plants. It is a rare combination, especially in a new country, this association of the finer features of nature with the harsh rasp of gang-saws and the rumbling of ponderous railway rolling stock. This is a touch of nature which appeals to the sympathies of all who love her for herself. At the head of Lake Simcoe, famous for its fishing, and a delightful summer resort, is an unexceptionable lunch room; and while the passengers are breakfasting or dining, the train runs up to Barrie a couple of miles on a branch track. Barrie is a handsome brick town upon the sloping hillside that girts Lake Simcoe, and the locality of a famous Trotting Course, where annual meetings are held in July. At Collingwood there are two large saw mills, a long pier, and an immense grain elevator, and very little else. The place is low and in attractive, and in winter bleak and wind-racked. Three steamers compose the Collingwood Line. It was my eminent good fortune to take passage on the "*Cumberland*," Captain Sandy McGregor, an accomplished gentleman and a most skillful navigator of intricate channels and uncertain shores. For be it known that, although the waters of Huron and Superior are vast and deep, fogs continually envelope their waters during the early summer months, and at all times treacherous gusts and storms are liable to sweep over their expanse. The water of the lakes, especially of Superior, is very cold, and it takes many weeks to equalize the surface temperature and the warmer air above. Often the steamers have to "lie to" for twenty-four hours and more, and when a heavy sea is running, proximity to sunken rocks and fog-enveloped shores becomes unpleasant. Tropical fruit doesn't grow in this latitude; but the Aurora Borealis often gleams out on calm clear nights to remind the tourist that the Arctic "ice blink" is not many degrees to the northward. From the time we left Collingwood until my return in the middle of July, I was not without my overcoat on some portion of each day. At all times warm clothing should be at hand for immediate use, to meet the constantly varying moods of the weather. Yet there are many sunny days which cheer the wayfarer, and make him feel that it "is good to be here."

At Collingwood Landing a motley crowd is gathered to witness the steamer's departure. The deck-hands of the boat are all full-blooded or half-breed Indians, and hard-workers they are, too. Then there is the remarkable consociation of Scotch, English, Irish and French, which are always noticed throughout the Canadian Dominion, all busy about the freight-house and wharf. There is a general scene of bustle and activity everywhere. The only persons not employed are a dozen of do-nothing negroes who lie around loose and impassively watch the proceedings. The presence of so many is an enigma to practical geographers who know that Ethiopia lies in the tropics. These are doubtless retired barbers, waiters, and whitewashers whom handsome fortunes realized have made independent of work.

The freight of the steamer is a curious conglomeration of mills, implements, live stock, furniture and supplies, *en route* for the mines or the more distant and far Northwest. The Canadian Pacific Railroad also adds a large business to the steamboat line, and gangs of surveyors with their outfits are constantly going forward.

Not many hours after we leave the land we are on the broad expanse of Huron, as boundless to all appearance as mid ocean. Seldom does a floating object come into view. There is nothing but the life within the vessel to break the dead monotony of the watery waste without. But on the second day a grateful change is sprung upon the scene. We are in Georgian Bay! Islands succeed islands in an unbroken continuity hour after hour as we glide on; islands of every conceivable size and shape, more numerous than the thousand islands of the St. Lawrence many times multiplied; islands barren, wooded, sandy, rocky, columnar, gracefully rounded, precipitous and gently sloping, wind-swept and storm-polished, large, diminutive, and infinitesimal; reefs widely spreading, and submarine monoliths whose peaks barely project above the surface. There is a breadth and sweep and never-ending change in the panorama which is all-absorbing to a mind intent upon the picture. For one hundred and seventy miles we steam through this island scenery! In the calm repose of a summer morning, when the waves are stilled and the face of the lake gleams like polished glass, the shadows fall heavily from the indented shores, and every rock and tree is sharply outlined and reproduced inverted in the mirror. Then we seem to float on airy nothing, looking upward into cloudland and downward into cloudland, into depths above

and below that seem illimitable. There is very little animal life upon the islands. The main land is a continuous upheaval of bare Laurentian billows of granite that once were moulted. There is but a scanty growth of trees. Sweeping blasts have scathed them and frequent fires blasted out their vitality. There are very few houses and but little cultivation. Occasionally a bark canoe glides from behind a point, and at intervals a solitary fisherman's hut is descried. Were it not for the gaunt white gulls that hover over our wake or keep vigil on the rocks, this would be a solitude.

In places the flinty strata of rocks yield a mineral wealth sufficient to induce the sinking of a mining shaft, or the back country affords a supply of furs which necessitates the establishment of a trading post and depot. At these the steamboat touches, sometimes to take in wood, sometimes to land a passenger, and anon to discharge some freight. At the hamlet of Killarney, 173 miles from Collingwood, we run into a rocky passage so narrow that we almost touched both shores. Here is a hamlet of a dozen houses, a store, a small fleet of bark canoes, and a score of loungers, chiefly half-breed Indians. A few miles farther is Indian Landing, a wooding place with a single shanty, where an intelligent Indian sells mats, miniature canoes and birch bark toys to curiosity seekers, and drives a thriving trade. There is an Indian village of five hundred people a few miles distant which boasts a very neat stone, chapel and substantial dwellings, some of them of stone. Next on the route comes Little Current, another small hamlet, and here a tide sets between the islands with a four-knot current. Singular phenomenon in this great lake of three hundred miles in length! It is said the tide is caused by the wind, that it sets in whichever direction the wind is blowing at the time. Still further on is the picturesque Hudson's Bay Company's post called La Cloche, with its sunny white buildings, red-roofed. The water is shoal for two miles out from the shore, so that all supplies for the post have to be landed and received at an isolated hut far off. When the boat arrives, great birch canoes manned by Indians of every hue and degree of miscegenation put out from the distant shore, and with sturdy arms and many paddles, skim over the intervening space. From the stern of the foremost flaunts the red flag of England, and under its official agis a fleet of light canoes filled with lads and squaws and their papposes, follow in the rear. When they have reached the steamboat landing, the men and boys squat in line upon the shore and motionless watch the bustling operations of landing freight. The squaws sit in their canoes and nurse their progeny, never wincing under the scrutiny of the glasses levelled at them from the promenade deck. When the boat departs, the aboriginal coterie, having filled up the measure of this little episode in life, paddle back to headquarters. What noble impulses swell their tawny breasts! what ambition, what pride of race and traditional renown must stimulate them to other deeds of like emprise!

At the Bruce Mines, three hundred and seven miles from Collingwood, are the huge chimney stacks and shops and piles of copper ore and ranges of hovels two miles long that belong to this great company that delves the precious metal from the bowels of the surrounding earth. The works have cost over a quarter of a million of dollars.

We are now near the head of the lake, and presently enter the wide and serpentine St. Mary's river, with its Indian reservation and villages upon the Canadian side, and an occasional farm on the Michigan shore. Forty miles more, and we reach the Sault, with its foaming rapids, its great ship canal, and the rival villages that confront each other from either shore. Here if one elects to tarry, he will find good fishing. There are numerous Indians on hand to lend their services and canoes, and if the sportsman will try the Garden river on the Canada side, he can fill his creel with trout, though the stream is much netted by the tribes of Lo. Sixteen miles below the Sault is Hay Lake and its outlet, affording fine trouting and good duck shooting in their respective seasons. There is a very comfortable hotel at Sault Ste. Marie called the Chippewa House, but the town itself is not attractive. The green parade ground of the old fort alone relieves the monotony of dingy houses and rotting plank sidewalks that characterize the place. The Canadian side is more picturesque, and there are some fine private residences there.

Through the Sault and into Lake Superior! We have traversed one vast Mediterranean, and another is before us. We have still 417 miles to sail by the route to our destination. And Duluth the terminus, is 198 miles further yet! It is only now that we begin to realize the immensity of these inland seas. The voyage for duration is like a journey to Europe. Great ships of thousands of tons burthen, traverse its highways, and storms that are not surpassed in violence agitate its depths. One hundred miles we speed after losing sight of land, and then arrive at Michipicott Island and river. Here in summer the boats tarry a few hours that excursionists may pick up agates along the pebbly shore or catch huge trout in the adjacent waters. Were it not that so much larger fish can be taken in the Nepigon, the size and quantity of these would seem amazing. Some of the agates found here are of unusual beauty and transparency. The light-house keeper, who has a sort of monopoly of the business, in that he has thoroughly raked the placers, will sell a pint of them for a dollar.

Hence to Prince Arthur's Landing and Fort William the distance is 306 miles. The latter place is ninety-six miles beyond the Nepigon. Boats generally go there direct and touch at the latter place on their return. Fort Wil-

liam is an Hudson's Bay post. Its oldest building is one hundred and sixteen years old, built of stone, and loop-holed for musketry. There are some thirty offices, stores, dwellings and out buildings within the main enclosure. A couple of iron cannon guard the entrance; two antiquated sailing crafts lie at the landing; and a tall flag-staff towers over all. Very neat and well cared for is the ancient post, with its lawns, hot-beds, flower gardens, grainaries and live stock. The old factors who have sojourned here, totally isolated from civilization until recently, neglected none of those appliances that could make their life tolerable. Good old wines stock the cellars, rare pictures hang on the walls, croquet is set on the lawn, and the bird of Juno screams from the white washed paling. There are Guinea fowl, piggeries, henneries, apiaries, dove-cots, and stock-yards; rare plants, redundant vegetables forced under glass, and trailing vines in profusion. Indian employees and French half-breeds lodge on the premises, and fifty gaunt dogs, long-legged, sharp-eared and wolf-like, stroll at random by day, and make the place hideous by night. The principle store is vast in extent and contains a variety of goods in quantity that would seem to exceed all possible exigencies of demand. In old times, visitors were few and far between, and the Indians who came in the spring to bring their furs, and returned to their traps in the fall with their winter supplies, were the only society the wilderness afforded. As it is, the place is shut out from the world for seven months of the year. But the Canadian Pacific railway survey has wrought a great change. The hundreds of surveyors upon the routes need supplies, and have created a demand for transportation, while the prospect of the speedy construction of the road has induced emigration. Last year the steamboat line was established, and the way to this remote region is now made easy.

Prince Arthur's Landing is three miles east of Fort William. It is a frontier slab and canvas town that has grown up within four years in expectation of being made an objective point on the railroad route. It contains five hundred inhabitants, who are supplied with grog by two taverns and shops. Should the road give it the go-by, its rapid depopulation and decline is predicted. There is a route hence to Fort Garry, Manitoba, which has been laid out to compete with the American steamboat and railroad line *via* Duluth, Brainard, Moorhead, and the Red River. It is called the "Dawson route." Patriotism, want of cash, or a concession to the powers that be, have impelled many a poor emigrant to travel four hundred miles over this dismal succession of alternate ponds and portages to his land of promise in the far Northwest, when he might have accomplished the journey by the American route with more comfort in less time. The conveyances over the portages are rude wagons, and little tug-boats tow batteaux through the lakes and frequent reaches of water. There are some forty portages in all, and baggage and freight has to be shifted as many times as there are portages.

Prince Arthur's Landing lies at the head of Thunder Bay, an expanse of water twenty miles in diameter, encircled by an amphitheatre of fantastic hills and guarded at its portal by Thunder Cape, a rugged headland of columnar trap several hundred feet high. In a fog, when the steamer's whistle sounds, the reverberations leap and re-echo from point to point of the entire circumference of the bay. But when the Titanic voice of the thunder-blast rolls through the broad expanse, it resounds with mighty intonations that shake the cliffs and split the air, and give to cape and bay their most appropriate name. It is the tongue of the Great Spirit, Nana-bijoo, that speaks. But, alas! for the reputation of the Indian storm-god! That divinity once upon a time got *drunk*, and lying down upon the summit of the cliffs, never rose again. His gigantic form can even now be seen plainly limned in the outline of the adjacent mountain ridge. It has been the custom of the Indians to toss him a bit of tobacco, by way of a propitiatory offering, as they pass! but most of them at the present day regard it as a useless waste of the precious weed—*kavin nishin*—not of much account.

Twenty-two miles east of Prince Arthur's Landing is the far-famed Silver Islet, which yields an annual wealth of revenue to the company of Americans that work it. It formerly belonged to Canadians, who could not make it pay; but they bite their lips now in rueful disappointment to see the precious treasures that are constantly unearthed and shipped away by the hundred barrels at a time. The mines are of untold value and could not be bought, it is said, for less than \$18,000,000. Silver Islet—*almost of solid silver*—was originally a rock but a few yards long that rose from the waves a half mile from the main land. Delving into it, and following the shining lead, the miners sunk their shaft some three hundred feet down into the pyramid, and bringing the debris to the surface have enlarged their insular domain, protected it with massive cribs, and erected their engine houses and other buildings thereon, structures of massive timbers tree-nailed and bolted together, to resist the winds and waves that beat with mighty force upon this coast. The "lead" trends north-east, and the miners are now working under the lake toward the main land, taking the risk of their uncertain roof falling through and letting in the mass of waters that flow overhead. Upon the main land are the company's stores, and other works, and other shafts now being sunk to head off the lead. Steam tugs ply to and from the island and bring over the precious ore and the gangs of laborers employed. So strict are the rules and precautions against pilfering, that each miner is obliged to strip and be searched before he leaves the islet. This discipline he agrees to before he enters the service.

Now for Nepigon, seventy-four miles eastward. Steam-

ing for several hours along the coast, we enter the noble Nepigon Bay, the most picturesque and enchanting of all the many localities of Lake Superior. Within its bosom are large high islands, fifteen hundred feet from base to summit, covered with verdure; little islets that scarcely afford a resting place for the trees and shrubbery that make them beautiful; grassy, marshy lowlands that feed and shelter water-fowl innumerable; and away up at its head, and within the embrace of the river, is the famed Red Rock, sacred to the great Manitou and all the other Indian gods, and covered with devices, totems, and hieroglyphics that tradition says were indelibly graven on its face when the rock was formed. This rock is a red slate cliff some 800 feet high, whose face contrasting with the living green of the verdure that envelops it, presents a charming feature and always a prominent landmark from distant points. The Indians manufacture pipes from the stone, and these pipes are always regarded as "good medicine."

Half a mile above is Red Rock Landing, a Hudson's Bay Company's post and the starting point for our canoe voyage up the river. This letter is already so long that I will only touch salient points that may be of value to sportsmen who contemplate a trip this season. Here can be obtained almost everything requisite for camping out; cedar boats, and birch canoes, tents, blankets, woolen shirts, Hudson's Bay overcoats, corduroys, cigars and tobacco, canned fruits, dessicated meats, condensed soups, milk and coffee, pickles, English ale, whisky for medicinal use, new Testaments, flour, pork and ham, cutlery, boots, shoe-packs—at ridiculously low prices. Good guides and Indian canoe-men can be had at a dollar per day each. The river is forty-five miles long to the great Nepigon Lake at its head, and is broken by fifteen chutes or falls, at all of which is the best of fishing. It has an average width of two hundred yards, and at frequent intervals widens into lakes two miles and more in width, in which the toothsome white-fish and the great lake trout dwell. Camping ground is excellent everywhere, and there is a beaten trail across the portages, over portions of which a wagon might pass with ease; for this has long been a thoroughfare for the Company's employees, who, once a year at least bring down their furs and carry back their annual supplies to Nepigon House above. There is ample casting room throughout. The depth varies, as I have found by actual soundings of my own, from twenty to two hundred and fifty feet, and the water is so cold at all times as to benumb the limbs. Its temperature is about 38°. In September partridges (ruffed grouse), are thick as bees, and the forests abound in bears, rabbits, and other fur-bearing animals and small game. There are a few cariboo, but no deers or any other species of the genus *Cervus*. By August the flies and punkies will all have disappeared. The trout will have become fat and gamey; for they spawn later here than in most other localities. Bring your tackle with you. Include trolling tackle, a stout rod, and red and brown hackles, and you are well prepared for business. Do not permit habit or education to induce you to doubt my instructions, or think the season too far advanced. August and September are the glorious harvest months for trout.

And now, beware how you shake hands with old Bob Crawford, the jovial, genial agent of the Company's post, for he has a heart as warm as mush and a grip like a steel trap. I'll tell you all about it in my next.

Don't forget your warm clothing, for the nights are cold. HAVELOCK.

STUPENDOUS ENGLISH BETTING.

UPON the Derby of 1867 Lord Hastings lost by far the heaviest sum that was ever lost on a race. It seems but the other day that the air was vocal with the enthusiastic cheers that greeted his appearance on the course at Ascot, after paying away through his commissioners about £100,000 on the Derby settling. In many a little race at Newmarket Lord Hastings backed his horse to win £10,000. It made no difference to him whether the bookmakers asked him to stake £2,000 or £5,000 against their £10,000. Whatever they offered in the way of odds, so long as the sum was large enough, he was content to book; and during his short career on the Turf the odds laid were shorter and the gains won by the bookmakers larger than during any three years of the present century. He often paid away £40,000 or £50,000 upon a settlement after a Houghton or Second October meeting; and since Lord Hastings's time high bets have been the rule at Tattersall's and the Ring. Mr. J. B. Morris, the bookmaker, has been known to lay £40,000 to £600 against each of five of Sir Joseph Hawley's horses, against each of six of the Duke of Newcastle's horses, and against a horse of Mr. Chaplin's. Again, £1,000 to £10 has been laid that a certain horse would win the Liverpool Cup, and £1,000 to £10 that Sir Frederick Johnstone would ride the winner; and Mr. Chaplin has been known to win £140,000 upon the Derby, and Captain Machell, his confederate, £60,000. A year or two ago Mr. Chaplin won a levathan bet of £50,000 that The Hermit would beat The Palmer the first time they met, and £10,000 that The Hermit beat Marksman. You may meet men by the dozen at Tattersall's who, if they choose to tell you their secrets would tell you that their wits are worth £10,000 to £20,000 a year to them. Reduced to a system, nothing is safer than "business on the Turf." Lord George Bentinck for years kept up his magnificent stud by his book; and Mr. Harry Hill, his chief Ring commissioner, could, I fancy, tell us some piquant stories if he were to turn to his notebooks. It is said that in a single year Lord George netted nearly £50,000 upon a couple of horses alone.—*Gentlemen's Magazine*.

Quite an interesting pigeon shoot came off Aug. 12th at Ditmar's farm, Flatlands, L. I., among a few gentlemen from Brooklyn. The birds were only middling, and the most of them did not fly direct from the trap. There were 140 birds shot at. Dr. W. killed eighteen out of twenty, and Mr. Radin seventeen out of twenty. Several gentlemen practiced at thirty and forty yards with varied success.

Natural History.

AMERICAN SARDINE AND ANCHOVY.

THE minor fisheries of our coasts have as yet been entirely neglected and overlooked, though affording a sure and unfailing return for the capital invested in them. For instance, we import sardines and anchovies while countless millions of them are playing along our coasts. The sardine of Europe is the young of a species of herring, known, when full grown, as the Pilchard. They are found from the Mediterranean to the English Channel, are easily captured, and are preserved in sweet oil or pickled. On the St. Lawrence river, below Quebec, the French *habitans* put up quantities of young herring in this last-mentioned way, and thus prepare to meet the long winter and supplement their scanty and often failing crops of potatoes and barley. Any young herring can be thus preserved, and would meet with a ready sale everywhere. We cannot yet furnish the olive oil for the second mentioned method of preserving them, though it is to be hoped that the olive may be planted on the southern Alleghanies, where it would thrive admirably, as well as the cork oak. We ought not to be dependent upon Europe for such easily-raised products.

As for the anchovy, another of the herring family, we have it on our coast—a different species from the European one, to be sure, and perhaps smaller in size, but equally good for use. It is described in DeKay's "Fish of New York" as the *Clupea Vittata*, or satin-striped herring,* and is a well-marked fish, easily known by its projecting upper jaw, long gills and the bright silver stripe along its sides. It averages two and a half inches in length, but another species, found on the coast of California, is much larger. It is found at sea, near the coast, in countless myriads, and is a favorite prey of the blue fish. Only a few days since, while trolling for these ravenous pirates of the deep near the New York light ship, every bluefish we captured was gorged with the American anchovy. This delicate little herring is generally preserved by salting, or by grinding them up into a fine paste with salt. They are caught with fine purse nets, and would repay the small labor and capital required to go into the business in one season.

If the few remarks we have jotted down should prove interesting, we may continue the subject and describe the proper mode of harvesting these valuable but entirely neglected sources of wealth. J. CARSON BREVOORT.

*It is a true *Engraulis*, or anchovy, and was recognized as such by Baird and Girard. No figure of it has been published.

CARRIER PIGEONS.

SINCE the siege of Paris, where only balloons and carrier pigeons escaped the vigilance of the Prussians, much attention has been directed towards this most interesting representative of the *Columbidae*. Very few people whose tastes run towards pigeons are aware how many really bitter feuds have been fought out among ornithologists as to the exact classification of this well-known bird. Linnæus insisted that they should be classed with the Passers. Cuvier placed them in the category of gallinaceous birds; while Buffon gave to them the dignity of a distinct order. Another fact but little known is, that the Dodo, an extinct bird, whose fancy form is the constant illustration of most books of natural history, was the colossal bird of this family. Why is it, then, that the Dodo should be held in such ridicule by those having little respect for the sacred character of ornithology? Perhaps it is on account of his name, or because of his ludicrous form. If not too late, the proprietors of the *Graphic*, who are doing such wonders in a journalistic way, might add a Dodo or so to their list of professors and carrier pigeons, to go in the balloon! There is no reason to suppose that the Dodo would not be true to the instincts of his race. Instead of being limited, however to a tiny note, written on the flimsiest of tissue paper, like his diminutive congener, the Carrier Pigeon, he might tug along a whole United States mail bag, padlock and all, from the upper regions of air to the earth, 10,000 feet below. To be sure there might be this trouble in the way: it is possible he would lay his course for the Island of Mauritius, where alone he was once born and bred, and it is a long way from Mauritius to New York; but then as all things are possible for the *Graphic*, a special cable might be laid from thence hither, to transmit the news. As to the carrier pigeons to be used in the coming balloon voyage, if they are dropped at sea, we doubt whether any of them will ever reach their homes. We speak seriously now. The question of how the carrier pigeon finds its way home, must always be a puzzling one. Mr. O. S. Hubbell, an amateur breeder of these birds, who will furnish carrier pigeons for the *Graphic* balloon, writes as follows to that paper in regard to them:

"I go to my farm next Thursday, and will take in hand training the birds for you myself, and will deliver to you a dozen birds that you may depend upon, and you shall have proof of their ability in a few days, when I will send a basket of them, and you shall liberate them, each with a message, which I will transmit by mail to you as proof of their usefulness.

"These birds never find their way over long distances unless they have been trained by gradual stages.

"Their power of vision is very acute, and at the altitude in which they fly they have a view of the earth beneath, with its great landmarks and recognizable features.

"At 400 feet, the boundary of vision is a radial line of twenty-five miles.

"As they rise, the prospect widens in amazing proportions, and they fly

as much by a knowledge of the map beneath as the mariner does by the little one he carries. When lost, they fly in circles, gradually enlarging, until they recognize some old outline with which they had previously been familiarized. Their only guide being *intelligence* and an unswerving love of home (or what the phrenologists term *Locality*.)"

Our fishermen at Fulton market frequently receive fish which they are unacquainted with. Such specimens, if of small size, generally are classed by them under the comprehensive title of *affal*. Three peculiar specimens were presented to our notice lately, and were on exhibition at a noted restaurant in New York.

The first was a thin, flat sea-fish, about six and a quarter inches long by five inches breadth, and less than one inch in thickness. It is rather a rare species in these waters, and perhaps a dozen are caught during the year. It is of the *Scambridoe* family, genus *Vomer*, and this individual rejoices in the name of the *Vomer Brownii*, and may be considered as a poor relation of the mackerel tribe. The fish is remarkable for its bizarre and lustrous tints, and is not uncommon on our coast. A native of the tropical seas, its geographical range is so great as almost entitle it to be considered a cosmopolitan. It is found on the Atlantic and Pacific coasts. New York is probably its northern limit, and it is occasionally caught during the months of July and August. Sometimes it has been found a foot in length. It feeds on sea-weed, from whence the peculiarity of its form. (See DeKay, pl-25, fig. 78.) J. Carson Brevoort, Esq., in his contributions to Ichthyology, gives a full description of the *Selene Argenta*, another variety of this same family.

The second specimen was described quite accurately as "having a belly like a frog, with spikes on his back and belly, a corrugated concern, and fixed in his shell, and swimming like a jack in a box." This fish proved to be one of the *As-tracionidae* family, genus *Lactophrys*, and was the dromedary trunk fish, *Lactophrys Camelinus*. It has been occasionally taken on the shores of Long Island, but is rarely found further north. Some of the same family are known in the West Indies as the Trunk fish.

The third specimen bears a strong resemblance to the weakfish. Prof. Agassiz's assistant designates it as the silver corvina (*corvinus argyrolineatus*) of De Kay, or silvery perch (*bodianus argyroleuces*) of Mitchell. It is a native of the Caribbean Sea, and extends its northern range to the coast of New York. In Curvier's natural history of fishes it is called *le corb blanc d'argent*.

A letter from Turkistan to the Berlin Geographical Society describes a species of grouse upon the arid steppes which is a great adept in the art of flying. Many a time it must have miles and miles to travel before it can expect to find a spilt drop of water at the well-side. When in the air its movements are so quick and alert as frequently to baffle all the fierceness and strategy of the hawk. The only other animals living in that dreary waste are eagles, hawks, falcons and turtles. The birds prey voraciously upon the reptile, yet are unable sensibly to diminish its numbers.

The editor of the Macon (Georgia), *Telegraph* tries to make folks believe that toads eat buckshot. He says, with unchanging countenance: "The writer has seen one seize and swallow buckshot after buckshot as it was rolled towards it, until weighed down with the load it bore, further motion became impossible."

FORESTS—THEIR CULTIVATION.

THE *Country Gentleman* says: Thousands of persons have more land than they care to cultivate to ordinary crops, and some of it often which is not good for such crops, but would do well for timber. Then why not do something for posterity—and perhaps for themselves, too, by planting it to forest trees? It is easy now to do this; the information gained and imparted by such men as Andrew S. Fuller, Arthur Bryant, Sr., and others, has made forest planting comparatively an easy matter. Many farmers say they are working merely for their children; they desire to leave the latter something in the shape of property which will be good for a start. In such a case, why not plant a forest? By a judicious selection of varieties and careful culture through the balance of a farmer's life of about middle age, a forest may be established which will be worth many thousands of dollars, twenty, thirty, or forty years hence. There is, too, in planting a forest, this marked advantage over a natural forest—you can select the best varieties, such as are reasonably certain to be always in demand. You can choose maples, tulips, pines, the hemlock, black walnuts, hickory, the ash, chestnut, locust, &c., &c., separately or together, the matter to be determined largely by the character of the soil. How to start in such an enterprise can easily be learned from the authors mentioned above, and from other sources, and a little attempt at tree-growing from seed or seedlings on a small scale, in advance of starting plantations by the acre, would result in an amount of practical experience which would be of great benefit. Cultivation of artificial forests would not be necessary more than a few years, as the shading of the earth by the trees would soon keep down the growth of weeds and grass, while the leaves would constitute a mulch, as in natural forests. The growing scarcity of timber for the thousand purposes to which it is applied, with little probability of any substitute for it which can seriously lessen the demand, renders it well nigh certain that forests planted now and well started, will be a rich legacy to future generations, and in many cases even to the planters themselves.

Attempts to keep mackerel in aquariums, seem to have been so far unsuccessful. The fish are so impatient of confinement, that they dash against the glass or rock work, and speedily kill themselves.

The lake Como affords but poor fishing. The chub is occasionally caught there. The presence of trout is quite possible, though none have been caught for the last two or three years.

In Japan there is a journal devoted exclusively to rabbit culture.

The Kennel.

WRITE about dogs, their instinct, their peculiarities, their thousand lovable traits? Why, there is not more than one man in a thousand who can do it. It is a gift, a peculiar one, and is as rare a talent as to write children's stories. There are but few who are so gifted. The power of making a dog analysis of character we are not all blessed with. It is only but yesterday that we commenced to study their expressions, with Darwin as our teacher. If dog literature proper, and most charming reading it is, has a particular country where it flourishes, and therefore must be appreciated, that country is Scotland. All good dogs and good dog stories come from there. How pleasant are the stories of Sir Walter Scott and his dogs, and of the Ettrick Shepherd. Nowhere can be found subjects so genial, or more close to our sympathies, than the stories of our dogs. In a late number of *Chamber's Journal* there is an article simply entitled "About Dogs," which is so charming in style that we only regret that want of space prevents our taking it bodily into our columns. Let the extract, however given, suffice; though treating principally of the "Collie," still the intelligent sportsman can make his own deductions, for the same underlying traits of character are found in all breeds of dogs. We quote:

"Without training, a pointer would point at any kind of vermin as readily as at the game of which the sportsman is in quest, but a well trained pointer will make no such mistake. Without training he would only stand pointing for a few seconds, and then run in upon the game, and put it up; but a well trained pointer waits till he receives the word of command, when his master has come near enough to use his gun. It may be in part through instinct that a shepherd's dog performs many of the important services which he renders to his master in the driving and tending of sheep; but it cannot be altogether through instinct, for the best shepherd's dogs are always those who have been carefully trained. Even that which the shepherd's dog does without training, and which seems natural to him from his puppyhood, is probably very much ascribed to what is called hereditary instinct, the training of many successive generations. But all cannot be ascribed to instinct, whether natural to the race, or acquired and become hereditary. How can any one think so, who has observed a shepherd's dog at his work, and marked his prompt obedience to the command of his master; how readily he understands each word or sign, and at once hastens to do what he is bidden? Perhaps to bring in a number of sheep from a distance, which he accomplishes very quickly, and yet without hurrying them too much, for he is very careful not to do them any harm, and his barking, although sharp, is not angry, nor do the sheep seem to think so, or to be in the least degree alarmed, for they also have profited by experience, and they know him and his ways. Let the object of the shepherd be to get sheep through a gate; the dog evidently perceives it at once and knows what to do, to bark behind the sheep, to run before them and bark, to drive them to the gate, and prevent their passing it. More remarkable still, and decidedly an evidence of the possession of reason, is the fact that a good shepherd's dog will assist a sheep to rise when it has fallen, rolled over on its back, and cannot get up again, because, in consequence of its thick fleece, it cannot get a foot on the ground. This often happens, especially on hill pastures, in the latter part of spring and beginning of summer, before the sheep-shearing time, and the shepherd must visit his flock several times a day, lest the sheep that have rolled over on their back should die. But his dog saves him much walking and fatigue, scouring over the hill for him, and as soon as he finds a sheep on its back, proceeding to turn it over with his muzzle, till he gets its feet to the ground, so that it is able to rise.

No wonder that the sheep-dog is a favorite of his master, and is treated as a kind of humble friend. He is not turned into a kennel nor into an outhouse when he comes home from his work; his place is at the fireside, where he often wags his tail and puts on a very intelligent look, as if he understood some part of the conversation that takes place. Certainly "Collie" knows well enough when he is spoken of, and dogs of some other kinds evidently do so too. They know when they are alluded to in terms of praise, and when with blame; in the former case, giving unmistakable signs of delight; and in the latter, hanging their heads and looking ashamed. Sir Walter Scott mentions this concerning a favorite dog that he had, a noble hound, of a very different race from the shepherd's dog. But it is very observable in the shepherd's dog. The shepherd's dog, or at all events, the *collie* of the south of Scotland, which I take to be the most refined and cultivated breed of shepherd's dog, shews himself very sensible of the affront, and vexed by it. He has a ready appetite for oat-cakes; oatmeal in one form or other, but mostly in that of porridge, being a chief part of his food, as it is of his master's; he will at any time gladly receive a little bit of oat-cake; but let any one hold out to him a very large piece, and he evidently thinks it a cruel jest, feels himself insulted, turns away his head, and will not look at the cake, much less accept it. We know of no other kind of dog that so generally shows his fastidiousness. We have tried the experiment with collies, and always with one result; they would have nothing to do with a very large piece of bread. We have tried it also with other dogs of various kinds, but almost always with the opposite result. No piece that was offered seemed too large for any one that we ever tried—Newfoundland, pointer, terrier—except in one case, that of a Skye terrier, which turned away, as if aware of being mocked, if a whole side of bread was held out to it, and would not approach the sugar-bowl even if it was set on the floor, although very fond of sugar, and ready to beg long for a little bit of it.

It is worthy to be observed concerning the shepherd's dog, that no severity is ever used in his training. The shepherd has no dog-whip. A single punishment, such as a game-keeper often finds or thinks it necessary to inflict on a pointer, would spoil a collie altogether, and make him worthless for life. He would not resent it by turning savagely on his master, but he would at once become broken-spirited and inert. Words of commendation or of censure are all that he needs, all that suits his nature. The same thing may be observed in animals of some other kinds—as in the elephant and the finest breeds of horses. The fine feelings of the Scottish shepherd's dog, and his capability of having his feelings deeply wounded, are sometimes

very strikingly illustrated. The grandfather of the present writer had an excellent collie, by name Wattie, which was a great favorite, and greatly attached to him and all the family. When the dog grew old and feeble it was thought necessary to get another one; but on the new dog's arrival, poor old Wattie left his place at the fireside and went out to a green bank beside a pond, where he lay down, and no persuasion could induce him to return to the house. He wagged his tail a little when kindly spoken to, but he continued to lie in the same spot and would not rise. He refused food, and in two days was dead. He seems to have felt that his day was over, that his services were no longer valued, and his old place no longer his, and took it all to signify that his time was come to die. His death, however, seems not to have been the result of mere old age, but to have been hastened by his wounded feelings."

The following dog story of an ugly retriever is worth preserving:

"I had been shooting at Marshfield, and had taken the dog with me, and having some time to wait at Blankborough Station for the train, I thought I would have a glass of sherry, so I went into the refreshment-room and the dog followed me. Standing at the bar were two men, one of whom was discussing cold chicken. Haven taken a mouthful or two from a leg which he held in his fingers, once or twice he stupidly held it down almost close to the dog's nose, evidently on purpose to tantalize him. The animal, of course, thought the bone was meant for him; and at last, when the man's attention was for a moment attracted by something else, he snapped it out of his hand without more ado. The fellow instantly turned round, and kicked at the dog savagely. The consequence was the animal sprang upon him, and before I could interfere had him down, and had fastened his teeth within a couple of inches of his throat. Of course I pulled him off as quickly as possible, when no sooner had the man got on his legs than he began to abuse me in most unparliamentary language for keeping such an animal. I stood this for some time, but at last it became too strong, so I said to him: 'If you take my advice, sir, when you are again picking a bone of chicken between your finger and thumb you will do well not to tantalize a hungry dog by holding it close to his nose. And I have only further to remark that this quarrel is not mine, but simply rests between you and the dog, so that unless you keep a civil tongue in your head I shall let him loose, and you may settle it between you.' I need hardly say the discussion was dropped, and a few mutterings in a scarcely audible tone of voice being the only reply I received."

GREAT CHANGES IN CLIMATE.

THERE can be no doubt that the climate of this Northern hemisphere has changed enormously more than once. There can be no doubt that the distribution of land and water, the shape and size of its continents and seas, have changed again and again. There can be no doubt that, for instance, long before the age of ice, the whole North of Europe was much warmer than it is now. Take Greenland, for instance. Disco Island lies in Baffin's Bay, off the west coast of Greenland, in latitude 70°, far within the Arctic circle. Now there certain strata of rock older than the ice have not been destroyed by the grinding of the ice-cap; and they are full of fossil plants. But of what kind of plants? Of the same families as now grow in the warmer parts of the United States. Even a tulip-tree has been found among them. Now how is this to be explained? Either we must say that the climate of Greenland was then so much warmer than now that it had Summers probably as hot as those of New-York; or we must say that these leaves and stems were floated thither from the United States into Baffin's Bay. The polar current sets out of Baffin's Bay southward, bringing icebergs down, not leaves up, through Davis' Straits. And in any case we must allow that the hills of Disco Island were then the bottom of a sea: or how would the leaves have been deposited in them at all? So much for the change of climate and land which can be proved to have gone on in Greenland. It has become colder. Why should it not some day become warmer again? Now for England. It can be proved, as far as common sense can prove anything, that England was, before the age of ice, much warmer than it is now, and grew gradually cooler and cooler, just as, while the age of ice was dying out, it grew warmer again. Now what proof is there of that? This: Underneath London—as, I dare say, many of you know—there lies four or five hundred feet of clay. But not ice-clay. Anything but that, as you will see. It belongs to a formation late (geologically speaking,) but some what older than those Disco Island beds. And what sort of fossils do we find in it? In the first place, the shells, which are abundant, are tropical—Nautili, Cones, and such like. And more, fruits and seeds are found in it, especially at the Isle of Sheppey. And what are they? Fruits of Nipa palms, a form only found now at river-mouths in Eastern India and the Indian islands; Anona seed, Gourd seeds, Acacia fruits, all tropical again, and Protaceous plants, too, of an Australian type. Surely your common sense would hint to you that this London clay must be mud laid down off the mouth of a tropical river. But your common sense would be all but certain of that, when you found, as you would find, the teeth and bones of crocodiles and turtles, who come to land, remember, to lay their eggs; the bones, too, of large mammals, allied to the tapir of India and South America, and the water-hog of the Cape. If all this does not mean that there was once a tropic climate and a tropic river running into some sea or other where London now stands, I must give up common sense and reason as deceitful and useless faculties, and believe nothing, not even the evidence of my own senses.—*From Town Geology, by Rev. Canon Kingsley.*

The following paragraph does not fall strictly within the line of sport, but we print it. It is the copy of a bill for hanging and boiling a Friar at Canterbury, England, in 1539:

"Paid for half a ton of timber to make a pair of gallows for to hang Friar Stone, 2s. 6d.; to a carpenter for making the same gallows, and the dray, 1s. 4d.; to a labourer that digged the holes, 3d.; other expenses for setting up the same, and carriage of the timber from Stablegate to the Dungeon, 1s.; for a hurdle, 6d.; for a load of wood and for a horse to draw him to the dudgeon 2s. 3d.; paid to two men that sat at the kettle and parboiled him, 1s.; to three men that carried his quarters to the gates and sat them up, 1s.; for halters to hang him, and Sandwich cord, and for screws, 1s.; for a woman that scowered the kettle, 2s.; to him that did execution, 3s. 8d.; total, 14s. 8d."

Woodland, Lawn and Garden.

HEDGES AND THEIR USES.

NO. I.—ARBOR VITÆ.

THE study of hedge plants—there use, and the various kinds best adapted to the different sections of the United States—is in itself sufficient for quite a large volume. Yet in answer to several questions as to what are the best kinds adapted to, and their special cultivation for, several localities of South and West, we will give a brief sketch of our experience in the cultivation of these elegant substitutes for the stone and wooden fences, rustic railings, &c., which years ago were so widely used all over our country, for the reason they were the best kind then known. Experience, study, and the mission of the landscape gardener, with the refining influence of the application of the principles of high art to the common necessities of life, have opened a wider field both for the use of the beautiful and practical. Our own experience has led us to make various experiments, and we are gratified to be able to say, that for the most part our experiments have been profitable and very acceptable to those who have used them.

There are some six or more plant materials from which some five or six years of careful labor and attention will give a beautiful and excellent hedge; and some of great beauty, even in this varying climate of ours. Let no one, however, who loves the beautiful in the hedge-row, suppose for a moment that all that is necessary to give him a fine hedge is to plant out the seed and let the same take care of itself. If he only plants the seed, and goes fishing, and forgets all about his hedge, he had far better have "gone fishing" before he planted his seed. Care and careful watching are absolutely necessary in order to have a fine hedge of any kind; such as can be had of great beauty, capable of resisting the attacks of every kind of cattle; a well grown barrier, too, that will outlast many generations. Among the five or six really best hedge plants for general use, we place at the head of our list the Arbor Vitæ or (flat cedar) found growing abundantly in many localities. This well known plant is probably the best that can be used for evergreen hedges, possessing as it does the remarkable qualities of quick growth, the foliage being of a beautiful deep green and growing down to the very ground, retaining its evergreen character during the entire year. The Arbor Vitæ found in the region of the Hudson river seems to be a distinct species from many other kinds with which we are familiar, and is perhaps unsurpassed by any other kind in this climate. This kind we have found from experience to be perfectly hardy, in the most adverse situations. It is very rarely attacked by insects; the slug, aphids, and many other "bugs of prey" give it a wide berth. Under favorable circumstances, it is a very long lived plant; how long it would live we do not know, but probably to one hundred years.

The Arbor Vitæ of the Hudson, and the Arbor Vitæ obtained from the State of Maine, are decidedly the best to be had, and these we can recommend as being quite likely to give entire satisfaction to all who love a good piece of work and are willing to give to the work the attention it deserves.

No plant bears the shears better than the Arbor Vitæ. Easily kept in order by two prunings in a season only, it very readily takes the shape desired, and soon becomes a thing of beauty, or a "horrid fright," under the clippings of the man of intelligence, or the boor.*

I have received many letters within a period of some ten years asking for information and my opinion upon the different qualities of the *hedge plant*, their adaptation to soil, climate, and other important matter relating to the same. "How shall I plant it?" is a frequent question asked, and a pertinent one too.

Every one having the care of grounds in the country, large or small, is aware of the past want of some good rapid-growing, well developing, evergreen plant for screen hedges and blinds, barriers, &c. Well, you have the very thing in the hardy beautiful Arbor Vitæ, adapted it seems by Providence, to the very wants of man. We shall speak of other and valuable beautiful hedge plants in discussing the subject of hedges and hedge plants; but in this paper, confine ourselves to this one plant. The great ease with which it gives you a splendid hedge, is a great recommendation to its universal use. While the "browns" disfigure many other kinds of hedges, the Arbor Vitæ is always green; while with the Red Cedar, somewhat used in hedges, some of the larger branches and very hardiest trees suffer from an attack of "the browns," and die off without any apparent cause. Such is sometimes, and I may say often, the case with the Chinese Arbor Vitæ. While such a disagreeable and repulsive feature, surely, may be looked for as not uncommon to the Red Cedar and Chinese Arbor Vitæ, such a thing as a dead tree of the Arbor Vitæ of the true kind I have never yet seen.†

I have a hedge of the Arbor Vitæ now upon my grounds in the town of Arlington, Mass., some two hundred rods in length, seven feet in height, which is one beautiful compact screen of green, unimpaired and beautiful. It is about fourteen years old. This hedge was set out one very warm day in the month of July, and was not watered except by the natural rains which fell, for the entire season. I have

*We have no patience with that horrid exhibition of bad taste, called "topiary trimming" of Arbor Vitæ into monstrous beasts, birds, and unheard of dragons.

†Last winter, 1872 and '73, was one in the East New England States, that tried the bark of trees. The thermometer fell far below zero, and the cold was intense. I was called professionally for advice in relation to the best usage of the Arbor Vitæ hedges by several persons who had planted in a very exposed situation. I recommended their waiting until June and July before putting the knife to them. My advice was good. They are now all right.

two circles composed of Arbor Vitæ plants, upon my lawn grounds, set out for ornament, which are twenty feet diameter and of a height of twenty-two feet, forming a perfect plot or group, and presenting an evenness of exterior as though clipped with the shears, and yet they have only been twice clipped each season. Those plants were when set eighteen inches in height, and set one foot apart. The plants of the Arbor Vitæ can always be obtained. The best time to plant them is in the Spring, from May first to June; they will thrive if well planted in July. The same great law of vegetation, however, seems to govern all plants; when the buds begin to swell, you can with safety begin to plant.

Good plants from the nurseries are worth from eight to thirty dollars per hundred; choice ones from one to four feet high, range a little higher. Having determined to plant a hedge, after well trenching the ground, you would do well to select your plants at the nursery yourself, and having obtained good plants, be quite particular in doing your work of setting out well, and in the most thorough manner. The general rule for setting is one foot apart. *Mulch* your plants, when practicable, upon setting out the same, and by no means drown them because you have an abundance of water. We believe the Arbor Vitæ as well adapted to the Western States, as to the New England States, they with due care thriving well in either locality.

OLLAPOD QUILL.

News From Abroad.

ENGLAND is complaining of excessive heat, and Sydney Smith's suggestion "of stripping off ones flesh and sitting in ones bones," is frequently alluded to. However much they suffer, they seem to take an optimist's view of what they cannot prevent. The partridge they say, will not be worse for the weather, and as the young birds are strong and plentiful in number they can stand drought at their age much better than wet. Grouse require perhaps more water, but the hot spell, English sportsmen think will not hurt them. Cricket is played just as ardently as ever, though the temperature is such as might have roasted Mr. Alfred Jingle. The corn is in grain, and the land wants the sun, and is grateful for it. One fact to be mentioned, however, for the benefit of future almanac makers is, that it rained on St. Swithin's day, and in the most perverse way, acting the very reverse of the usual prophecy, it has been constantly dry ever since. Some idea of the heat in England and Scotland may be had when we read that on the Trent and in the Highlands during the week ending July 26th, the thermometer stood as high as 90°.

Salmon fishing in Norway seems to be declining. From "Over the Doverfields," a new fishing book by the author of "A Ramble Through Norway," we extract the following:

"Of late there is a complaint that salmon fishing on the whole is rapidly deteriorating in Norway. Year by year the prices paid for the rivers have risen, till it has at length come to the point that a Norwegian river is fully as expensive a luxury to indulge in as a Scotch grouse moor. We have known £300 per season to be paid for a stream barely half a dozen miles in length, and even then saddled with the proviso of giving up the bulk of the fish taken to the proprietor of the river.

The worst of the matter is, that as prices have gone up the fish have gone down (in quantity), a result principally owing to the unprincipled conduct of the natives themselves. Not content with the heavy sums in which they mulct the "mad Englishmen" (for such they consider them), they not only flog the waters most industriously during their absence, but also net them without mercy, particularly at the point where the rivers throw themselves into the fiords, and that with most melancholy success.

The Storching, it is true, so early as 1857—awake to the evil results that would come to pass, should these practices remain unchecked—passed a law forbidding the use of nets at the mouths of salmon rivers. This law, however, has never been carried out in its integrity; the fish are dwindling away to a tithe of their numbers twenty years ago, and the stupid proprietors—while chuckling over their present gains—will find, when too late, that they have been but giving another variation of the old fable, 'killing the goose that laid the golden eggs.'

The following correspondence occurs in *Land and Water*:

"BIRDS WALKING UNDER WATER.—Sir: Last week I took a cormorant in my trammels (bottom fishing nets) in about six to eight fathoms of water. This occurrence is not a rare one, but it has an important bearing on the letters of Mr. F. O. Morris and Mr. W. Reid in your two last issues. To make it a common occurrence, as it is, that birds should be taken in nets, fishing several fathoms under water, the birds must be able not only to dive (vertically or obliquely), but also to swim (laterally) under water, and it occurs to one at once that it would be physically impossible for any bird to do this unless it could in some way assimilate its specific gravity to that of the water around it. I am not sufficiently scientific to hazard an opinion whether it might not be necessary, to enable a bird to get six or eight fathoms deep in the water, that it should be able to make its specific gravity greater than that of the water to equalize it for the purpose of enabling it to swim, and to reduce it for the purpose of enabling it to rise. Mr. Reid's letter goes to support the theory that these things must be. He does not mention the sea-bird, in which, of all others, the power of submersion can be most frequently observed. An alarmed grebe will solemnly disappear until it leaves nothing visible but a slender neck surmounted by a small head, and having behind it a mere suspicion of a back, a back which, in nautical phrase, is 'barely a wash.'

Has any one in the United States observed similar traits in the cormorant?

There is a movement in England, to do away with the barbarous practice of cropping terriers' ears.

A very interesting book by Charles John Anderson, entitled "The Lion and the Elephant," has just been issued in London. The author, half Englishman half Swede, traveled with Francis Galton in 1850, in his explorations into South Africa, when they even went beyond Lake Ngami. The book is said to be not only remarkable as the narrative of a hunting life with all its thrilling incidents, but evinces wonderful research. It is the production of a perfect sportsman and naturalist. The following extract from that portion of the book devoted to elephant shooting, shows how much endurance is necessary for the sport.—

It was rarely or never that I could track, stalk, and kill my elephant and return to camp in less than ten hours; more frequently I was absent from it for fourteen and sixteen hours—nay, I have been as much as two days and a night engaged in a single hunt. My attendants (native) were at times so completely used up—I myself being nearly as much so—that on their return to the bivouac they would fall asleep where they stood, alike indifferent to hunger, to the chilling night air, or the scorching rays of the sun, as the case might be. . . . It was not, however, hunger or fatigue that was most trying; the heat was more so. The sun, 'blazing in a sky of brass,' heated the atmosphere to a state of suffocation, and the loose sandy soil to blistering intensity that made 'Water! water!' the incessant cry; but water, frequently half-boiling, even when we could carry a decent supply with us, rarely allayed our burning thirst. Indeed every fresh draught seemed merely to augment our ardent craving—often almost bordering on madness—for more of the precious liquid. A giddiness, a languor, a sense of oppression throughout the whole system, a choking sensation in the throat, a difficulty of speech, a fearful palpitation of the heart, and a nightmare feeling about the chest, were frequently consequences of our excessive fatigue.

The London Society for the Prevention of Cruelty to Animals, is fortunate enough to have a Ladies' Committee, under the direction of Lady Burdett Coutts. The society has lately received a legacy of £10,000, and have invested £34,000. The Duchess of Teck is a prominent member.

A pike weighing thirty-five pounds was recently caught in Loch Corrib, having inside of him a grilse weighing six pounds.

Chain mail gauntlets and suits are advertised in an English paper, for the use of Indian officers.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species, governing rules, &c. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

L. H. B.—In regard to the Canadian system of overseers and wardens for guarding their fishing streams, the adaptation of such a plan to our rivers would be excellent. The trouble is that in the United States, at the same salaries as are paid in Canada, it would be difficult to find competent men. An inspector receives in Canada \$725 a year and travelling expenses. County overseers only get from \$50 to \$250. Wardens \$400 to \$750 a year. The assistant inspector of Nova Scotia has a salary of \$800 with travelling expenses.

XXV.—The law in this respect is positive. It says "no person shall kill or expose for sale or have in his possession, after the same is killed, any wood duck, &c., &c., between the 1st day of February and the 15th of August." The Justice of the Peace in your section must be very ignorant of his duties.

ST. JOHN.—Here is a good old fashioned receipt for mange, which almost always cures. Take four ounces of sulphur ointment and add one ounce of turpentine, mix, and rub the dog well with it twice a week. Continue this long enough, bathing him from time to time in a running stream. But if this will not avail, it would be better to shoot the dog.

J. B.—We are not prepared as yet, to execute any commissions confided to our care. We trust, however, before the shooting and angling season is over, to do the best we can for our friends.

DAVID.—Any information you may require as to the formation of a rifle club in your town, would no doubt be cheerfully given you by the Secretary of the National Rifle Association in this city.

BLAKE.—A very large white-fish will weigh six pounds, occasionally one has been caught of eight pounds. Generally two pounds is a very fair average. The exact orthography of the Maskinonge we can hardly give you. We have heard both Muscalon and Mascalonge. Mr. Scott gives its derivation, as coming from the Ojibwa "*maskanongja*." We rather think the French "*Maskinelonge*," meaning a long-headed fish, as far fetched. The head is by no means out of proportion to his body.

MORRIS.—Mr. Prime in his charming book "I-go-fishing," notices almost a similar fact as reported by you. He says: "I have seen a trout start from a point forty feet distance for a bait thrown into the Pemige-wasset and take it, and I was so much surprised that I measured the distance." We should be pleased to hear from you more fully. What we want is not merely a fisherman, but one who combines the naturalist's habit of observation.

A. H.—As courteously as possible we beg to state, that we must decline solving betting questions. It is not in our line.

DOVE.—The cost of the journey would be \$200. Indian guides are not always to be had. If you start three weeks later than you propose you will be in good time. The calibre of your rifle is about right. We shall be glad to hear from you.

BALTIMORE.—The fact you mention in regard to feigned lameness of birds, is quite novel, at least in this country, having perhaps escaped observation. English writers have, however, mentioned it, and in a late number of the *London Field* you will see somewhat similar traits recorded of the wood pigeon.

BROOKLYN BOWLER.—Of course the match took place. Cricket would not be cricket in England without the Gentlemen vs. Players. The results were as usual, the Players were nowhere. If our memory serves us right, the two brothers Grace on the Gentlemen's side made between them 200 runs. The play took two days, and the Gentlemen won by fifty-five runs. This match has been played regularly for sixty-seven years.

H. M.—For distances over 100 to 150 yards for rifle shooting, round targets are not advisable. At long ranges, it is difficult to communicate with the riflemen the exact position of his shot on a round target. How true it may be, however, that the four corners of the square, indicate better to the marksman the exact centre, we do not know. But very certainly at anything over 100 yards, better practice is made with a square than with a round target. The system of averages is even fairer than the one of measurement. Approximate precision is all we can look for now, and all that it is needed at long ranges.

THOMPSON & TAGG, PA.—Your favor will appear in our next.

G. V. L. Cincinnati.—The reply to your query is answered in part in our angling column.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will endeavor to no approved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

Calendar of Events for the Current Week.

THURSDAY, Aug. 14.—Utica Trotting Park Association, Utica N. Y.—Second meeting Saratoga Association, Saratoga, N. Y.—Danville Agricultural Society, Danville, Penn.—Regatta Seawanhaka Yacht Club of Oyster Bay.—New York Yacht Squadron Cruise.

FRIDAY, Aug. 15.—Danville Agricultural Society, Danville, Penn.—Utica Park Association.

SATURDAY, Aug. 16.—Atlatana Rowing Club Regatta.—Danville Agricultural Society, Danville Penn.—Saratoga meeting, Saratoga, N. Y.—Amateur Oarsmen of the U. S. meet at the Metropolitan Hotel in the evening.

MONDAY, Aug. 18.—N. Y. Yacht Squadron at Newport.—Amateur Regatta, Geneva Lake, Wisconsin.

TUESDAY, Aug. 19.—Hampton Park Association, Springfield, Mass.—St. Catherine's, D. of Canada, Amateur pigeon shooting.

WEDNESDAY, Aug. 20.—Hampton Park Association, Springfield, Mass.—Single scull match on the Connecticut river.—Monmouth Park, Long Branch.—Kingston Driving Park Association.

THURSDAY, Aug. 21.—Caledonia Club, annual meeting, Myrtle Avenue Park, Brooklyn.

TO INTENDING SUBSCRIBERS.

Persons receiving the first number of the FOREST AND STREAM, will do well to preserve it. As we do not stereotype our forms, we cannot supply back numbers to any great amount, although we shall print an extra large edition to meet anticipated future demands.

Let it be impressed upon all that the paper will be valuable, not only as a work of reference, but as a compendium of useful information on all topics. We offer it in a very desirable condition for binding.

OUR CONTRIBUTORS.

We may well congratulate ourselves and the public upon having secured so valuable a corps of contributors as have pledged us their support. Without mentioning names at present, we will merely state that we include many of the most eminent naturalists, scientists, fishery officials, and gentlemen sportsmen in the United States. Most of these are now scattered from the Labrador to California, but when the summer is ended, and they have returned from their several missions, we shall hope to reap the benefit of their experience and investigations. A rich fund of material is in store for us for autumn and winter reading.

We shall adopt the practice of appending the real name of the contributor to his article, unless objected to. We shall print nothing that is worthless, and in many cases the name adds the weight of authority to the article.

We claim to have the most graphic, suggestive, and artistically elaborated engraved title of any journal in this country or Europe. We have spared no expense in its preparation. Drawn by J. W. Beard, the well known animal painter, and engraved by J. H. Richardson.

ANNOUNCEMENT.

UPON the occasion of a self-introduction to the public, it is becoming to manifest a certain degree of modest retirement—a kind of yielding resistance, so to speak, to the impelling motives that may qualify the intrusion if they cannot excuse the pretension. As regards the debutants of courtly salons, who have been taught in the school of strict etiquette and self-assurance, or have a Turveydrop's keen sense of the proprieties, this presentation act is always invested with a charming grace. But for us of the FOREST AND STREAM, attired in the rustic garb of the woods, and fresh from our inner seclusion, what else can be expected than an *entree* made awkward by a natural diffidence? Our embarrassment is more than a pretense. As well might it be expected of the Dryades and Hamadryades to appear in the full glare of the public gaze and dance unabashed to Orpheus' step-compelling lute. Our tastes are rural and our habits of the simplest. We drink from pellucid fountains, or, if we quaff Falernian, it is of the purest natural juice and not of the stimulating stores of Bacchus, or of Silenus, his foster-father. We read from Nature's book alone, and our instructions are written on Sybilline leaves. Here is our card, good reader, to announce our mission. It is of simple birch bark, peeled from a tree in whose veins the sap flows freely. In texture it is more delicate than the ancient papyrus. It is odorous of balsam and fir and sweet trailing vines. Herewith we bespeak your favor. Though a stranger, we feel that you will bestow it, for is it not written, "One touch of Nature makes the whole world kin?"

Through the columns of our beautiful paper we would make you familiar with the living intelligences that people the woods and the fountains. We would teach you those secrets which necessity compelled the savages to learn—how to wrench fire from dry sticks; to feed, clothe and shelter themselves with the simple roots, barks and skins which the wilderness provided. They familiarized themselves with the habit of every form of animal life. Under each decaying leaf, in each blade of grass or rolling log, they discovered a microcosm. They learned to read the trackless forest as though it were an outlined chart. And if they did not find "sermons in stones and beauty in everything," they at least found utility. Let us go back to first principles. Out of these our civilization grew, but of the principles themselves we are ignorant. Remove temporarily our modern appliances and we are helpless. Let us acquire the rudiments anew. We know not at what moment the storm may lay us ashore upon an island uninhabited, the earthquake leave us naked to the elements, or some adverse circumstances beset us as we travel on our wilderness journeys.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognized medium of communication between amateurs and professional sportsmen. All of us have something to impart, which, if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular game animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yachting news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those outdoor games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find place or favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognized throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall

continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timber-lands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished and competent army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of a competent reform. We shall perhaps even *clamor* for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with a single exception, have been identified with leading journals for years.

Mr. SIMEON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

CHARLES HALLOCK, Managing Editor.

THE NEW ERA OF ATHLETIC SPORTS.

THAT the taste for athletic sports has at last passed through that critical period called "the growing one," is now we believe quite certain. If we as a people have given some attention to out-of-door sports, it has been heretofore of rather a sporadic character, developing itself at most by out-croppings of base ball clubs all over the country. Without placing too much stress on this game, even according to it all the merit it deserves, we see now that for the very first time in the United States, other and better exercises, of a more manly and varied character, have been fully inaugurated.

Open-air sports should never be limited to a single kind. We must not play base ball to the entire exclusion of cricket, any more than we must always pull boats, and never run foot-races. We should be able to do each and all of them; giving all of our attention to a single athletic sport dwarfs true spirit in the matter. Just as certain as there is exclusiveness—one particular sport engrossing the entire attention—all the rest must languish. It is for this peculiar reason, that we must confess that we look at the decline of base ball with something akin to a grim satisfaction. Of course it was far better for our young men and boys to have had that, than nothing else. There was something even commendable in the fact that if we had not invented the game, we had at least revived an almost forgotten ball-play. Its course to public estimation, was as rapid as its decline. The nobler game of cricket was neglected for it, and base ball was heralded as the coming American game.

It is not sufficient to assert that base ball has gone out of fashion, because professionals had taken it entirely in their hands, and that amateurs could not cope with professionals. If the game had possessed within itself any sound vital merits, the gentlemen would soon have been able to play it quite as well as the professionals. Cricket is a game requiring ten times as much address and skill, but what is more, wants sound judgment, which is the soul and animus of all such sports. It is well known perhaps to the majority of our readers, that the best cricket eleven in England is composed of gentlemen amateurs, and that there is no professional team in England who can play with them. We feel certain even that the bad repute base ball has fallen into, though partly due to the gambling introduced into it, is not entirely owing to it. We are even pleased to notice that certain corrective measures introduced by professional players in their midst, are likely to create a reform in the character of the game. It is not to be in the least understood, that professionals either in base ball or any other sport, are to be decried by us for their calling, or are to be blamed as a body, for the rascally proceeding of some of their members. Quite as honest men are to be found in their ranks as in any other profession. The best deduction to be made however in explaining the decline of base ball, is that there was not enough in the game itself, and that it was played to excess; and wanting variety, it has now only fallen into the third-rate place to which it naturally belonged. For the good it has done, and may yet do, we, as lovers of athletic sports, are quite grateful.

The newer era of athletic sports is manifested by the careful attention and fostering care given to them by men of wealth and education. To Mr. James Gordon Bennett, who has offered prizes for foot racing, a sport rarely if ever practised in the United States, our gratitude is also due. It is another step taken in the true direction. Its apparent exclusiveness, that the reward shall be given to non-professional winners is its merit. Professional runners can always find their proper spheres and can win their laurels, and will learn that their services as trainers will be even more called into play. Our aptitude for athletic sports, it should be remembered, cannot exist on the reputation of any particular runner or boatman. It is not because the Japanese breed a single race of men, huge as elephants and strong as bulls, as wrestlers, that we accord to this peculiar people any athletic excellence. What we want is, that our sons should revel in these sports, that their every muscle and fibre should be drilled and trained, not for the vain-glory attached to the conquest of a cup, or the sporting a knot of ribbons, but that they should feel that innate pride of perfect manhood, which should urge them to excel, and to improve the physical qualities nature has given them.

The last collegiate boat race, was another notable advance made in the annals of American athletic sports. If due applause has been given to the contestants, conquerors and conquered who pulled through that notable race, the highest commendation should be accorded to the administrative heads of those seats of learning, who have at last given this most important subject of physical development, not only their earnest attention but their hearty approval. Our American College Faculties have but acted according to the precedents laid down, by the Dons of those venerable Alma Maters on the other side of the water. They have discovered that instead of frowning down a most natural aspiration of youth, that desire to excel in healthful sports, that it was wiser that they should give it its proper bent; they have learnt, too, that instead of grudging a reluctant assent to what they could not prevent, it was better to even cherish and foster it. The aid and encouragement given to the collegians by our leading Faculties, is what every sensible man has been asking for, for the last twenty years. The boy now in his preparatory school, will learn to run, to leap, to row, to develop all the life God has given him, with the hope that when he enters his collegiate life, in addition to classical honors, the double prize of the athletic conquest may be awarded him. Slowly perhaps will parents and guardians learn that the masters to whom they confide their sons, do not think now as they did even ten years ago, that a hale, hearty youth, ready to race his mile, or pull his boat from sunrise to sunset, cannot be made quite as great an ornament of learning, and just as fitting for the highest collegiate honors as the more weakly boy, whose sick and rachitic tendencies, through want of physical culture, showed that he has scarce vital power enough to carry him through his course of study.

How long indeed it has taken us to understand, that there is nothing incompatible in a man's throwing a summersault one moment and the next translating Euripides. What strange conventional portraits we have drawn for ourselves and kept repeating the outlines, depicting the possessor of high mental acquirements, with haggard face, deep sunken eyes, and generally emaciated *contours*! It is the physique of a Tyndall, the power to climb the glacier, to scale the Alpine heights, to even tire out his guides, which give to this greatest of all modern scientists, all his scope and vigor. The intellectual life of Gilbert Hammerton tells us the same story over and over again. "Even philosophy itself, owes much to mere physical courage and endurance. How much that is noblest in ancient thinking may be due to the hardy health of Socrates." It has taken even a century, for statisticians to find out what was the most natural of God's laws, —that physical and mental culture must go hand in hand. A book is just fresh from the press on this very subject, which shows to an astonished world what they should have known long ago, and this is, the sapient fact, that the college oars of England, the famous boatmen of the Universities, live not only quite as long, but even longer, are less prone to disease in their older age, than those who have never pulled an oar. Strange to say, even novelists have gone out of their way to decry physical culture, and Wilkie Collins wrote a book, where the hero, from an over zest in athletic sports, perverts all his nobler qualities, until he becomes a drunkard and a murderer. But what is more absurd is, that there are found readers to believe such fiction. To-day it is quite questionable whether the morbidity of some men's minds, that inclination to suicide, to injure others of the human race, does not more usually occur in individuals whose physical condition has been most neglected. Consciousness of power—the knowledge of possessing strength, by one of the wisest of God's provisions, mostly tempers the passions of one blessed in this way. It is a slander on all mankind to suppose that physical prowess engenders brutal instincts. Strong men are proverbially good natured.

The question of money wagered on athletic contests, as appertaining to this subject, has been replied to time and time again. It is ever a narrow, bigoted argument, which tries to settle this gambling disposition on athletic sports. Is it to be supposed that because A. cannot outrun the writer, that from this fact A. must combine with his fleetness of foot, more decided gambling proclivities? It is not the race-course that turns men into gamblers, it is the blacklegs who corrupt the race-course. Unfortunately there are few human events, bringing together concourses of men, not marred by this vice. Must we to follow up this argument

abandon our privilege of freedom, and not vote, because a gambling pool is made up, to be decided by the hap-hazard of an unknown event?

We do however commend in the highest terms the stringent measures adopted by the Springfield authorities, on the occasion of the late boat-race, to crush out the gambling spirit, and perhaps it is quite worthy of comment to record the fact, and one we should congratulate ourselves upon, that the amount of money wagered on this race was quite insignificant. Though somewhat difficult to encompass, we see no reason why the rowing clubs themselves should not introduce some stringent rules, forbidding members from betting. If our memory serves us rightly, we have we think seen such rules as above suggested, incorporated in the regulations of certain clubs. Of course it not within the province of the FOREST AND STREAM to become the censor of public morals. But did we know any method by which all betting or lotteries could be abolished, we would willingly give such a plan all the help in our power.

One fact not to be overlooked, is the exceeding good taste and judgement evinced by the religious press of the United States, on their departure from former preconceived notions in regard to rational athletic sports. Clergymen playing croquet are no longer excommunicated as miserable sinners, to be excluded from grace. Theological students are no longer held up as solemn warnings because they can pull an oar.

The sound and wholesome advice given by these particular journals, has done more to fully establish athletic sports, to place them on a sounder basis, than all the weaker stuff, produced *ad nauseam*, by the so-called sporting organs.

It is, then, to the schools and colleges that we look for the thorough propagation of all athletic sports, for certain are we that in the exercise of them comes the sense of manly honor and right. The time has passed away when a billiard room or a bowling alley in a college gymnasium are considered as lures of the evil one. Human nature and students are much the same all over the world, but we believe that by fostering the natural inclination for exercise inherent in youth, they will not only be the more scholarly, but the more christian.

COLLEGE BOATING.

ALTHOUGH the great excitement in boating consequent upon the Springfield regatta has somewhat subsided, rowing men will read with much interest and no little profit an article in *Harper's Magazine* entitled "Ten Years Among the Rowing Men," by William Blaikie. This paper is an eminently sound one, and treats in a rational way the much vexed question of training. Mr. Blaikie has no faith in those empirical rules in use some few years ago, when the least possible amount of common sense was employed. Men in training are free to partake now of every kind of food and fluid; all that they should be debarred of is the use of stimulants. Human beings are no longer to be considered in the same light as horses, to be restricted to two or three kinds of diet only, in order to get them up to the highest pitch of physical excellence. The antiquated formula for bringing up the system was not only absurd, but injurious, as it commenced by reducing it. Mr. Blaikie says: "This barbarous custom came from such wisdom as one found in *Boxiana* and works on training in by-gone days, and perhaps for the men it was meant for—prize fighters, sporting men, and their associates—it was well enough; for a hearty fellow, long used to loafing about bar rooms, and by his unrestrained appetites adding daily to his weight a puffy, beer-soaked sort of flesh, might find his body none the worse for, and his sensual nature cooled by, heavy sweating between feather beds, and by long walks and runs with top coats wrapped about him."

The old fashioned method, as described in the books of twenty years ago, never fails to start off with the necessity of preparing the man for his work, no matter whether he was well or ill, by first giving him a strong purge. This was supposed to remove all the bad humors, and to give him a new foundation to build upon. The natural reduction of the system, the dispersing of the extra quantity of fat, should be induced solely by the exercise, always remembering, however, that a certain amount of it is absolutely necessary for the human organism, and that to train too low down, or "too fine," loses more races than the opposite.

What a comfort it is, too, for the lazy ones to know that contestants for athletic distinctions sometimes err by overwork. "We hold that even to-day men in training are prone to do too much work. When the Harvard crew was in Europe, preparing for the struggle that created such profound surprise, at least among all Englishmen—for the latter had expected them to be beaten from the start, instead of leading probably the best crew Oxford ever had for two whole miles—they would, beside a little walking, paddle about over two or three miles in the morning, and generally go over the track from Putney to Mortlake (four miles and three furlongs) at a racing pace in the afternoon; then, after lying on their oars a little while, till they recovered their breath, would start back easily, and often swing into a stroke that gave the horsemen on the tow path something to do to keep up. And for this they were pronounced by the English press perfect 'gluttons' at work."

With the wide extent of country we have, and its climatic differences, to lay down any positive rules governing the amount of exercise to be taken is, we think, impossible. A good oarsman in prime condition on the Charles River

might take his spurts of speed over and over again without inconvenience, whilst an individual of equal physical stamina in attempting the same thing on the Savannah River, would only be the worse for it. Perhaps the heavy amount of labor the American boatmen impose on themselves arises from the fact that the generality of them have not in younger years inured themselves to the task, and their ambition induces them to somewhat overtax their powers by endeavoring to make up for lost time. There are, however, reasons why the work cannot be distributed over as long a period in the United States as in England. Taking a wide extent of country, from Portland to Baltimore, where boating may be supposed to have the most attention paid to it, our rivers are, on an average, only practicable during six months at the farthest, while in England the boating season is of fully ten months' duration.

One most important question not to be overlooked, and one which we shall use our utmost efforts to solve, is this: Is it found that the regular course of study is interfered with by boating? Mr. Blaikie's comprehensive article touches on this topic. He says: "The English students usually, if we are rightly informed, do nearly if not quite all their severe rowing at a season of the year when their studies exact comparatively little of their time, and thus the achievement of even the highest rank and honors are not, as has been more than once proved, incompatible with prominence on the river. But the American who wants to row a race, if he is yet a student, is very apt to find numerous examinations coming on at just about the time most convenient for the racing; while, if in business, he will attempt to prepare himself for his task after business hours, when he is of necessity more or less worn down by the labor and annoyances of the day."

Of course this is unfortunate, but there is no help for it. Though we are the greatest advocates of athletic sports, we hold that boating must be subservient to study. We are not sure, however, that any ill effects have yet been noticed by those most competent to judge of such matters. A very able letter, referring to this and kindred subjects, will be found at the conclusion of this article, from Professor Hitchcock, of Amherst College, addressed to the editor of FOREST AND STREAM.

The arguments advanced by us somewhat at length in the article on the New Era of Athletic Sports, as to the necessity of varying our sports, we deem to hold good in this particular case, where possibly the training for boating might interfere with collegiate duties. The supremacy in boating in England does not arise from the fact that they row only. Other exercises are in vogue. Of course the exact and elegant methods of rowing, under a good coach, take a certain amount of time, but this time is a limited one, and is secondary to the question of their muscle and endurance, which can be acquired by a thousand other ways than by being seated in a boat. The preparation, then, for the water contests in the United States must have its origin in ball play, foot races, cricket, the use of Indian clubs and all gymnastic exercises, which have to be carried on all the year round.

A true enthusiast, somewhat even of a Prussian as he is in his ideas of the superlative excellence of physical training, perhaps the most important portion of Mr. Blaikie's article is that devoted to the subject of having proper men to take charge of gymnasiums. Harvard, it is stated, had, not very long ago, an instructor, "an ignorant negro, who found his stipend so paltry that he was obliged to eke out an existence by giving boxing lessons and keeping an old clothes establishment in a neighboring cellar." Mr. Blaikie urges, and most properly, that in order to gain the respect of his pupils he who teaches in the gymnasium should have a moral and mental calibre sufficient to command the respect of his pupils, and should be conversant with the anatomy and physiology of the human body. "If gymnastic institutions were made compulsory and regular, the results, under the teaching of such a guide, would be swift and most gratifying." We are somewhat afraid of the *compulsory idea*, at least for the present, as far as regards exercise. But who knows? Compulsory education may, in time to come, so thoroughly instruct us as to the other wants of man, that what might seem strange to-day may perhaps be considered as a necessity some fifty years hence.

AMHERST COLLEGE, July 31, 1873.

EDITOR FOREST AND STREAM:

You ask me for my "opinion" upon the following questions: "What do you think is the effect of constant boat practice in colleges during term time upon the ambition of students to excel in the paramount objects of a collegiate course? Does not the encroachment operate injuriously? Are Professors impelled by public clamor to wink at it against their private conviction?"

Of course I can only answer for the students of Amherst College, and express *my own opinion*.

Of our students, not more than twenty have had more than a general interest in this matter, so that the great mass are unaffected in their ambition to study, and of these twenty, fully one-half are (have been) of such high intellectual ability, that their *rank* has probably not been in the least affected by it. Five or six of the remainder have no doubt suffered in their intellectual standing, and that mainly because they had poor preparation before entering college, and now need more time to prepare their recitations, than those who are quicker in their intellectual perceptions.

But of all our young men who have engaged in boating, there have been none who have *dissipated* in the exercise. If they have suffered at all, it is because required to take so much time for a few weeks of each summer term in their long journey to the water to practice in their boats.

I am sure that none of our Professors are impelled by popular clamor to favor this measure against their private convictions. But at the same time we all know that there is never a time in college when the students, many of them, are not deeply interested in something *only germane* to the intellectual work of the college course. If it be not secret societies, it is chess playing; if not ball game, it is theatricals; when the concert and glee club fever runs low, then a moot court or squabble over parliamentary tactics is sure to make some popular excitement outside the regular college curriculum. And here is where a college Faculty need the most

wisdom, not to repress with such a sudden grip that something will give way in the body scholastic, or that too much license allows the college to degenerate into professional gamblers, politicians, and tricksters. And right here is where the boating inflammation has attacked the college. It is not a constitutional affection, but one that is purely local, and a condition like that of boils brought about by the cold water treatment of disease, a sure sign of vigor and vitality in the body as a whole, which has the power to develop a "crisis," and thus strengthen and fortify against unusual demands and attacks of disease.

The inter-collegiate Regatta seems to develop among not only the students, but the alumni also, a feeling of ownership in the college, which in an indirect way is of great service to any college, for what college is there which does not live in its alumni?

And whatever may be the feeling of any Professor, that a few of the boating men with poor preparations for college, and minds not moving rapidly, have suffered because of their preparations for the Regatta, still every officer of our college will not fail to admire the zeal and steadiness, and high moral conduct with which every member of our crews prepared for and went through their ordeal at Springfield; and personally I cannot but feel that as boating is conducted with us at the present, the aquatic exercise is an advantage to the college body as a whole, and in the general average to the students engaging in it. And yet it is simply honest for me to state in conclusion, that some of my associated Professors hold decidedly different opinions on some of the matters mentioned here.

Prof. EDWARD HITCHCOCK.

THE LONG ISLAND FIRES.

THE fires on Long Island have not been as destructive to game as was at first represented. Very little, if any, has been destroyed, although quite a large area, as much as 25,000 acres, have been swept over by the flames. The game existed but sparsely in the peculiar locality, the fire not having reached the South country, excepting in a few portions; and these were between Patchogue and Lakeland, exactly where in former times there had been fires, a ground now covered by scrubby oaks and stunted pines. Little or no game has ever existed to our knowledge within the limits of the late fire. Had it, however, extended across the Long Island Railroad, or east or south in the open fields bordering, on which large timber and good feeding ground is found, an irreparable damage might have been done to the game, such as quail and woodcock, which abound there in greater quantity to-day than for many years before. If it is possible that any good can come out of a calamity of this nature, if the fields and woods have suffered, the fisherman can derive some comfort from the fact that it is quite possible that the small streams running through the burnt district will even be benefitted by the fire. It will start into active growth again the scrub trees on the banks of the streams, and as it may take years before the hand of man can cut them, they will shade the springs, which will be of benefit for the fish. The fire seems to have extended to West Pond (Woodhull's), on the west side, but did not harm Canaan Pond to any great extent. As to larger game, there are no deer to be found in the immediate locality of the fire.

These frequent fires are becoming dangerous as well as simply destructive. Is there no way to prevent them? Shall we drive off the locomotive, or crush out the charcoal burning industry, both of which are much blamed as the origin of these fires? Is there no way of checking by reasonable restrictions the carelessness of the brush burners, permitting them to burn only in the winter, or when the verdure is green and flowing with juice? Shall we permit the engineers of trains, even of express trains, to pass heedlessly by a fire just caught, and licking up the parched grass and making its way to brush and thickets which are dry as tinder? What shall be done to cure the indifference of the farmer to the occasion of the thin blue spire of smoke which he sees curling up from his neighbor's territory on a day so hot that wood will almost ignite spontaneously in the sun's torrid rays? Ah! Messrs. Farmers, an ounce of prevention is worth a pound of cure, and sometimes a little more attention to the pecuniary interests of your neighbor, and less to his morals, will save yourselves a "heap" of trouble. We have seen many conflagrations which were permitted to gain an uncontrollable headway because the gradually rising flames did not seem to threaten your own crops and fences.

TO THE LADIES.

We humbly invite the co-operation of the ladies. What success is complete without their countenance and sympathy? We shall print articles with special reference to their perusal and edification. Every word in this paper will be as chaste as Diana herself. She was the patroness of the chase and of forest sports, and a divinity whose beck no cavalier or rough rider would be loth to follow. Why should not our ladies of the present day emulate the spirit and action of their female ancestors, not in riding, spurred and booted, astride the saddle, man-fashion, but in cultivating the blush of rosy health upon their cheeks by open-air exercises in which men can participate? We cordially invite their contributions upon all topics which come within the general scope of our publication.

TO ADVERTISERS.

Dealers in all kinds of supplies likely to be required by sportsmen will perceive upon critically examining our paper that it must at once become a valuable advertising medium.

The ramifications of a sportsman's requirements are so numerous and divergent, that they reach to many branches of trade. We shall aim to put the purchaser in direct communication with the seller, by informing where any required goods can be bought. Sportsmen are often obliged to hunt the city for some essential article, because it is not advertised. A journal like this which deals in specialties, is far more useful to the class of advertisers whose patronage it seeks, than one which advertises miscellaneous business.

A PLEA FOR THE BROWN BEAR.—We enter a plea for the unfortunate trick bear which is daily paraded through the streets of New York and Brooklyn, and made to go through his exercises under the sweltering sun. Bears who have the freedom of the forest can indulge in siestas under the shade of the laurels and underbrush, but this poor beast must endure the full force and glare of the midday heat, half sick with the process of shedding his hair, and clad in a thick shaggy overcoat which Nature compels him to wear in the dog days. The few bystanders who stand in the shade and watch his evolutions with a painful interest that is plainly visible on their faces, perspire freely in their linen coats, while the man who bosses the bear fairly glows with the heat and reeks with sweat, which he sops with his handkerchief. The bear is docile, obedient, cowed, and obeys each well-learned signal of his master, but should he demur at any time a savage jerk at the iron ring which passes through his nose, or a threatened blow from the ever-impending club, will at once discourage any attempt to resist.

More than once the woes of this miserable bear have appealed to the sympathies of the public, and ought to be regarded. To be sure, both man and bear must subsist; if they have chosen this method of earning a livelihood let the partner of the concern having the most intellect set apart proper hours and seasons. If he does not, we advise the bear to "strike" and break the contract. Mr. Bergh, please notify your deputies.

UP IN A BALLOON.—The daily *Graphic* publishers are preparing their big balloon, and we wish to assist in giving it a good "send-off." Although our paper bears the distinctive name of *FOREST AND STREAM*, we claim to devote some attention to the air and ocean,—and though this big balloon is neither the one nor the other, but rather something between the two, so to speak (that is, the projectors say it will be next 25th instant), it nevertheless comes within our ken and notice. Briefly, we have great hope of the enterprise. The balloon is sure to go up, and when that goes "all is gone save hope." Winging its way heavenward, mounting to the zenith, vanishing at last into thin air, gone perhaps forever, will not the enterprise, with its projector and voyager, have fully established itself as an *airy naught*? (See *aronaught*.) Under its competent Professor, who is both Wise and weather-wise, can anything but success be expected? We trust it will strike that eastern current, and, guided by the same propitious star which led the "wise men of the East" lang syne, be wafted to its destination. We ought to do at least as much for the balloon as the war has done for us—give it "inflated currency."

We are pleased to give the fullest notice—and it is well merited—of still other prizes offered to yachts, &c., by Commodore James Gordon Bennett, but would particularly call attention to the fact that Mr. Bennett provides four purses, one of \$1,000 open to all schooners of any recognized yacht club, two of \$500 open to schooners and sloops, and one of \$1000 open to pilot boats, working schooners and smacks.

The colossal wealth of our bankers, merchants, and railroad men, is the constant theme among all classes. Why can't we induce more Bennetts, Lord Hardys and Jeromes to give prizes? Let a prominent man in each seaport and inland town of note, give a purse for yachting, boating, and athletic pastimes, and he would receive more thanks from the higher class of sportsmen who are really beginning to feel that there is some good to be done in recreative amusements among the young men of America, than if he left thousands to be squandered by his heirs.

AN ADIRONDACK FISH PRESERVE.—We understand that a party of gentlemen are about leasing Preston Pond, Essex county, in the Adirondacks, for the private use of a club. These ponds form the sources of Cold River, a tributary of the Racket, and are filled with the finest quality of trout. For the past fifteen years they have been poached during winter and spring, and as many as fifteen barrels of trout have been taken out of them each year. We are glad that there is a probability of such valuable waters as these being rescued from the snares of the wanton and unscrupulous spoiler. We have a friend's authority for saying that some anglers (?) one day brought in from these ponds a tin lunch box which contained eighty-two trout. Poor little fingerlings! Noble line of sportsmen.

AN OLD RELIC GONE.—The *London Times* mentions that the historical York House, Twickenham, is about passing under the auctioneer's hammer. Here dwelt Clarendon during the zenith of his popularity. It was his literary Villa, and it is probable that during his residence there, Ben Johnson, Edmund Walter, Sir Kenelm Digby and Isaac Walton were the frequenters of York House.

FARMER, LITTLE & Co., type foundry, have furnished the elegant typographical dress for this paper.

Polo seems to have become now a regular game in England, though rather of an aristocratic character, and confined to cavalry officers, with a sprinkling of hunting men. A London paper says:

"There has been some regular play at Lillie Bridge during the week, but on Friday the public were treated to some of the most fast and exciting games that have ever been played there. The afternoon was devoted to a charitable purpose.

Attendance of the public on such short notice proved that they were actuated by a sense of good as well as by a love of manly sport.

The turf, considering the late broiling weather, was in capital order, and the ground was gaily decorated with blunting on every side. There could not have been less than 2,000 spectators present, and the carriage ground was

crowded also. Play began at four, and kept on with a few intermissions only till seven A. M. The band played some very choice airs, and the spectators stayed to the end, and were highly pleased. Mr. A. Murietta's side won by three goals to one."

FISH CULTURE.

AN expression of astonishment is often heard from persons who have not kept posted in the progress of fish culture in America, at what seems to them a strange, new business, that has, like the genii of Arabian Nights, sprung suddenly from almost nothing into vast proportions, and they often, while reading an account of the stocking of some lake or stream, or perhaps the starting or success of some private trout farm, give vent to their astonishment in the exclamation, "What a business that has got to be!"

They do not see the processes by which the results presented in a newspaper paragraph are arrived at; they cannot see the patient watching, the anxiety, with its accompanying periods of hope and despair, that have made the time seem long to the few earnest men who embarked in the new business before its success was assured, and gained the knowledge that now seems so simple, by hard work and careful experiment, often accompanied by the sneers of the unbelieving.

If, while Seth Green was at Holyoke for the first time trying to hatch the eggs of the shad, which floated, contrary to all his experience with fish eggs, and it was doubtful if he would succeed that season, the unbelieving had confined themselves to sneers, he would have felt grateful, but when to these weapons they added stones, and upset his boxes, it plainly showed that the opposition of the ignorant fisherman was stronger than he had supposed.

Had these things happened a hundred years before, he would have been put to death as a wizard. Yet these same men who persecuted him in his first attempts, no sooner found out that he had succeeded, and that the culture of shad was destined to become a fixed institution on the Connecticut River, than they came whining around for a job, and he showed a christian forgiveness by employing them.

The writer found something of the same spirit in the spring of 1866, while trying for his own amusement to hatch yellow-perch and alewives, (*Alosa tyrannus*) or as they are called on the Hudson River, herring, between Albany and Castleton, and only five miles from where he was this year employed by Mr. Green to hatch shad. The natives did not use stones, but after several times emptying an old leaky boat in which were placed the perch spawn hanging in long lace-like strings over sticks they broke it to pieces and carried off the shoe boxes in which the herring eggs were glued to twigs and plants.

These petty annoyances, however, were comparatively easy to bear, coming as they did from an ignorant class of men who probably feared damage to their business; but were as nothing compared to those who under the guise of friendship, took care to throw cold water upon everything connected with the new project.

These things are fresh in the memory of all the pioneers in fish culture, who, having borne the heat and burden of the day, are now rejoicing at the popularity which their once derided schemes for increasing the food fishes are attaining.

That fish culture, although of such surprising progress to some, is only on the threshold of its usefulness, is admitted by all who are at all familiar it. The day will come, and that shortly, when the great State of New York, instead of one hatching house to supply its whole area with salmon trout and whitefish, will maintain one on every lake.

They already have one at Cooperstown, on Otsego lake, which is doing a grand work in stocking its waters with the variety of whitefish which they persistently miscall Otsego-bass.

But we can afford to pass the hair-splitting about names to those whose interest in such things is confined to nomenclature, and shake hands with the public-spirited men who have built the hatching house and employed competent men to save a valuable fish from extermination. They have set an example that should be followed by the dwellers near the other inland lakes with which the State is so bountifully supplied.

As the Hudson River has furnished those living near it with tons of cheap and wholesome food, so can each of these beautiful lakes, which are now only so much waste space taken from agriculture, be made to yield a larger return, acre for acre, than the best grazing lands in the State.

That some few things have been done that will not be approved of in another decade is not to be wondered at; for instance, in the opinion of the writer, too much value is placed on a fish (in some quarters), for his game qualities; hence the popularity of the fresh water black-bass. Waters have been stocked with pickerel and muskellunge, simply because they afford sport. This ranges a few men against State appropriations for fish culture, because sport is often considered in place of cheap food. At the State hatching house there is little demand for whitefish because they do not take the hook, and therefore this most valuable fish is not disseminated in as great quantities as the salmon trout; but if the State would decide for itself which fish to stock certain waters with, and do it, instead of waiting for persons who are public-spirited enough to come and take them at their own expense, and who will only take such fish as may seem acceptable to their crude ideas, it would be far better.

It is not to be expected that we will all agree on many

points, and we would be more than human if we had no small differences of opinion. And while we may regret the loss of those fish which the State of California lately attempted to take over the long miles that lie between her and the Atlantic States, but which found a nearer resting place in the Elkhorn River, let us rejoice that the villainous yellow-perch was not allowed to reach its destination and multiply on the Pacific coast until it becomes such a nuisance as it has in the Atlantic States. It was a matter of surprise that a man like Mr. Stone would try to introduce this predatory bunch of bones along with the valuable cargo of useful fishes that he had in charge. If our lakes and ponds could be drained, and every pickerel, yellow-perch and sun-fish exterminated, it would be a grand opening for the fish culturist to introduce the better fish without having these worthless wretches devour his more valuable fry. They are the weeds, so to speak, of fish culture.

The New Hampshire Commissioners are introducing the smelt, which was formerly supposed to exist in salt water only, and which is a valuable addition to our food fishes, as it is not a destroyer of fry. This fish, or one so closely allied to it that the writer cannot tell the difference, is found in the trout streams in northern New York, where it is called by the guides frost-fish, and might be profitably introduced into other waters.

The variety of catfish that is common in the Hudson river, and called a bull-head—the square tailed sort—is a fish that for the table is nearer in flavor and texture to the aristocratic brook-trout than any other fish. I am aware that this is rank heresy, and that it may call down on my devoted head the anathemas of all sportsmen, who think the trout should never be mentioned in the same day with such a plebeian as this *Pimelodus*, but if there be any ignominy attached to this, let it be mine. I will go farther; if this aforesaid low-born bull-head was a shade handsomer, and gamey to catch, he would be considered the equal of the trout, and appear on an aristocratic bill of fare under a better name. His name!—there is another point against him—what lady would like to ask a waiter at Delmonico's for bull-heads!

The big oily yellow catfish of the Mississippi and its tributaries is hardly eatable; those from Lake Champlain not much better; but all specimens of this fish that I have eaten from Boston to Albany, and from there to Philadelphia, are splendid. This fish seldom bites at a minnow, but is readily taken on a worm. It will live in waters that are too warm for trout, is a better fish for the table than the black-bass, and does not destroy its neighbors.

The State cannot be expected to introduce fish for sport, and the sooner the fish culturist cease to consider gameness as a recommendation in any class of fish, and look only to its usefulness, the sooner fish culture will become more popular with the masses.

FRED. MATHER.

Athletic Pastimes.

CRICKET IN THE UNITED STATES.

WE have a large appreciation of the game of Cricket, and are inclined to give it a place among athletic sports higher, perhaps, than most Americans may yet be willing to accord to it. We have watched with satisfaction its gradual growth in favor in this country, and now feel assured of its firm establishment here. Its success we do not hesitate to say, is mainly due to the excellent English element incorporated in it. Take any Eleven, and the chance is that almost seventy-five per cent. is English. With true British pertinacity, they have stuck to it, and at last have imbued in Americans a fondness for the game. Without wishing to make any invidious comparisons, we are inclined, when contrasting the games of the various cities, to give the palm of cricket to the Philadelphia and Germantown players. Men cannot become true adepts in this splendid game when they take to bowling at twenty, or first hold the bat at the same age. That clear and intuitive perception necessary to become a master of this game can only be acquired in boyhood. Time matures and adds judgement, but it is the early *elan* which marks the fielder, the batter and the bowler.

The supremacy which Philadelphia holds is not manifested so much by their winning matches, as by the general acquaintance they have with the game, and arises we think from the fact, that perhaps more than twenty-five years ago, there was established near Philadelphia a woollen mill. Thither came the sturdy Nottingham and Leicester workmen and their families. If the workmen themselves did not play, their sons the English boys did. So it came to pass that in Germantown stumps were planted, balls were bowled, and bats were wielded. There was a fine set of American striplings growing up there, who wondered at this foreign game. It is true that in Philadelphia an antiquated club had been in existence for years, but it rarely if ever played. To the late Dr. J. K. Mitchell of Philadelphia, father of the present distinguished physician, Dr. S. W. Mitchell, much of the precedence which Philadelphia now enjoys is due. Dr. Mitchell in 1845 did much to organize the boy's clubs. Then matches were for the first time played between the American and English boys—real honest, sturdy games. At first Nottingham and Leicester made all the scoring, but after awhile the Germantown and Philadelphia boys held their own. This was the early school of the Newhalls, Fishers, and Wistars, and of the best native players of the day.

If this game is ever to be popular among the masses, it

must be commenced in this very way. The older clubs should do all they can to encourage the younger players. Fathers should teach their sons, and send wickets, bats and balls to their schools for their use. Then the time will come, when a fresher element will be introduced into the existing clubs, as from this younger stock they can draw vigorous players. At present there are five principal clubs, the St. Georges, Philadelphia, Boston, Staten Island, Waltham, and Young America. Of smaller clubs there are an infinity.

The New York Athletic, Boating and Gymnastic club met at their club house foot of 133rd. st. East River, on Saturday last to witness two races between members of the club. The track is the sixth of a mile long. There were about 300 members and friends present. The first race was for the 100 yards gold challenge medal, which becomes the property of the member having won it against all comers for two years. Mr. Buemeyer held it for twenty-two months when he was beaten by Mr. Burris. The same gentlemen ran on Saturday, the disparity in the size of the men is very apparent, being a difference of fifty pounds in their respective weights. Mr. Burris sprang away with a leading start, his opponent never catching him and making the 100 yards in ten and one fifth seconds. The time verges on professional. However the grade was considerably in favor of the runners. The second race for the 880 yards challenge prize was called a W. O., but according to the rules, W. E. Sinclair had no easy task to perform, having to beat two minutes and fifteen seconds; he succeeded in running the half mile in two minutes and twelve seconds, he looked in splendid form and is the picture of a gentleman athlete.

The following are the officers of the Club, President, G. M. Smith; Vice President, J. H. Stead; Secretary, R. W. Rathbone; Treasurer, M. E. Burris.

A Scottish *fete*, held at the Alexandra Park, London, attracted nearly 10,000 spectators, and was very successful. The great Scottish athlete, Donald Dinnie, won the Hammer Throwing at 112ft. 3in.; the Stone Putting, at 39ft. 9in.; Tossing the Caber; and the High Jump, 5ft. 6in. There were various other interesting competitions. Donald was in the U. S. some time ago.

A prominent Wall street broker, a member of the Health Lift Co., raises for his daily exercise, 750 pounds minimum and a 1000 pound maximum, dead weight in solid iron, and has lifted when feeling well and in good condition the extraordinary weight of 1400 pounds, without any straps or assistance of any kind.

Yachting and Boating

HIGH WATER, AUGUST 14, 1873.

AT BOSTON.	AT NEW YORK.	AT CHARLESTON.
4 h. 14 m. Evening.	1 h. 0 m. Evening.	12 h. 14 m. Evening.

EASTERN YACHT CLUB OF BOSTON.—This organization is the leader in yachting matters in Eastern waters, and is rapidly increasing in strength and influence. Its musterroll numbers 260 members, and forty-five yachts are borne on its books. The club has had two successful regattas this season and will probably get up another in a week or so, to which the New York Yachtmen would be heartily welcome. The annual cruise passed off with much enjoyment, and the members were gratified by their voyage among the islands off the rocky coast of Maine.

The officers of the club are as follows, the command-ship being vacant through the sudden demise of the late David Sears, Esq.: Vice Commodore, Stanton Whitney; Rear Commodore, John Jefferies, Jr.; Treasurer, Addison Child; Secretary, Henry B. Jackson; Measurer, Frank D. Child.

The annual cruise of the New York Yacht Squadron is in progress. The vessels of the fleet rendezvoused at Glen Cove on Monday, the 11th instant. The programme is to sail to New London, anchoring off that city, and then race to Martha's Vineyard. The fleet will then leave for Boston on or about August 15th, where they will be received by the Eastern Yacht Club, returning to Newport on August 18th, where the magnificent challenge cups, presentation prizes and purses will be raced for.

In consequence of the absence of the Commodore and Vice Commodore, the Squadron will be under the command of Rear Commodore Kingsland; Fleet Captain, W. B. Bend.

Yacht Calypso has been rebuilt on the same lines and re-christened the Atalanta.

Yacht Clio had and is numbered No. 15 New York pilot boat.

Yacht Phantom is now owned by W. H. Osgood.

C. W. Galloupe has presented Louis Agassiz with his yacht "Sprite," 80 tons o. m. Happy Agassiz, yacht and Island!

Yachts Wanderer and Wivern are for sale.

Yacht Vixen, owned by the late Anson Livingston, is for sale. Mr. Livingston had been an active member of the Squadron for twenty-nine years, and was one of the original incorporators.

Yacht Minnehaha, formerly owned by T. C. Durant, has been purchased by P. Phoenix.

W. P. Douglas has presented two cups to be sailed for by the Squadron at Newport. One for schooners and the other for sloops.

The Commodore, James Gordon Bennett, who is now at Cowes, England, owing to the kindness of W. P. Douglas, is fitting out the famous yacht Sappho for a cruise, his own yacht being in this port.

COM. BENNETT'S GIFTS.—The following cups and prizes are open to be sailed for during the season of 1873:—

No. 1.—Bennett Challenge Cup for schooners—course from Sandy Hook Lightship to Brenton's Reef Lightship and return—now in possession of the Club; value, \$1,500.

No. 2.—Bennett Challenge Cup, course from Sandy Hook Lightship to Five Fathom Lightship, Cape May, and return; held by Dreadnought; challenged by Magic; value, \$1,000.

No. 3.—Bennett Challenge Cup, for schooners, over New York Yacht Club or Newport courses; held by Tidal Wave.

No. 4.—Bennett Challenge Cup, for sloops, over New York Yacht Club or Newport courses; held by Vision.

No. 5.—Cup presented by the Commodore, to be sailed for on the second Thursday of October, 1873, by schooners of any organized yacht club, from anchorage off Owl's Head, to and around lightship off Cape May, and return to Sandy Hook Lightship; value, \$1,000.

No. 6.—Cups presented by the Commodore; one for schooners and one for sloops of the New York Yacht Club, to be sailed for, during the cruise, over Newport course; value \$500 each.

No. 7.—Cups presented by the Commodore, one for schooners and one for sloops, to be sailed for on the first Thursday in October over the New York Yacht Club course; value \$500 each.

No. 8.—Purses presented by the Commodore, to be sailed for on the second Thursday of October, 1873 under the direction of the New York Yacht Club, by pilot boats, working schooners and smacks (schooners) hailing from any port in the United States; the first vessel arriving to take purse of \$1,000, the first boat arriving of each of the other two classes to take a purse of \$250. No class, however, to win more than one prize.

The twenty-fifth annual regatta of the Atalanta Boat Club will take place on Saturday, August 16th. A steamboat and barge with Wallace's full band on board, will start foot of Christopher street, North river, where the members and friends of the Club will meet and sail up the Harlem river to their new boat house, foot of 133d street, East river. This will be their first regatta on the Harlem river. The members speak favorably of their new course, the river being better adapted for practice, &c., than the North river, owing to the great increase of navigation on the latter, which materially impedes their men in their light racing shells. They one and all express regret at being obliged to leave the "old stand" where many of the members have spent happy days both athletically and socially.

OFFICERS OF THE CLUB.—President, Ransom Parker, Jr., Vice President, W. H. Webster; Secretary, J. W. Edwards; Treasurer, H. Sprowell.

DETAILS.—First race.—For the champion silver belt; single sculls, one mile and a half and return.

Second race.—Junior belt; junior sculls, second man, a gold maltese cross: one mile and return.

Third race.—For the Ladies' plate; light oared barges, three entered: the crews are picked promiscuously from the club.

Fourth race.—Married vs. single.

The married men have won twenty years in succession, which speaks praises for the married life. A. Hardy and Thos. Van Raden, two of the international crew who went to England, will pull in this race.

On Friday, August 1st, the yacht match for the Prince of Wales challenge cup, took place at Halifax. On this occasion a reception was given to his Excellency the Governor, Lord Suffern. The morning was unfortunately cold and foggy, but this did not dampen the ardor of the Royal Halifax Yacht Club. Though the chances were that the thick weather would make it a tedious race, six yachts started at 10 hours 16 minutes. The boats entered were the Petrel, Cygnet, Kate, Spray, Whisper, and Cloud. The boats arrived at the winning point in the following order: Sloop Petrel first, Cygnet second, Kate third. The Petrel has won the two challenge cups of the year, having taken the cup for first-class yachts, and the Prince of Wales challenge cup.

The coming regatta in New Brunswick promises to be the most successful and grandest aquatic contest ever held in the Dominion. The following programme of arrangements has been made:

The Regatta, if the day be fine, will come off on Wednesday the 17th, September next, or in the event of unfavorable weather, on the first fine day thereafter. The course will be on the Kenebecasis River; \$2,500 will be given in prizes.

The first race is for four oared boats, lapstreaks or shells, open to the world, distance six miles with one turn. First prize, \$1,000, 2d. \$500, 3d. \$250. Entrance fee \$50. No third money to be given unless five boats enter or start.

Second race.—Single shell wherries, lapstreaks or shells, open also to the world, distance three miles, with one turn. First prize \$400, 2d. prize \$200, entrance fee \$20. No second prize will be given unless three boats enter and start. If four boats start, third boat to save her entrance fee.

Third race.—Four oared lapstreak boats, rowed from the gunwale; open to everybody, distance three miles, with one turn. First prize \$100, 2d. prize \$50. Entrance fee \$5. No second prize will be given unless three boats start; if four or more boats start, third boat to save her entrance fee.

Fourth race.—Double scull boats, rowed by Amateurs, not open to the water men, distance two miles, one turn. Prize a gold medal for each oarsman in the winning boat.

Fifth race.—Canoe race, bark canoes, distance two miles, with one turn, prize \$20. Entrance free.

Sixth race.—Tub race, distance two hundred feet, open to all. First prize \$10, 2d. prize \$5. No fee for entrance.

All entries, excepting the tub and canoe races, may be made with the secretary Mr. D. G. Smith, of St. John, until Wednesday, 10th September.

The regatta is under first-class and perfectly honorable management. The stewards are: Hon. Thomas R. Jones, chairman, James Dunville, Esq., M. P., Hon. Edwd. Willis, M. E. C., Thos. M. Reed, Esq., Mayor of St. John, Thos. Furlong, Howard D. Troop, A. C. Smith, Jas. W. Langeran, W. H. Tuck, Harry Leonard, D. McClellan, I. V. Thurger, Oliver P. Stone, (Treasurer,) and D. G. Smith, Esqrs. Competitors are likely to come from every quarter of the Dominion, and several are mentioned to come from the United States. The above is the official programme. Every arrangement is being made for guests and visitors. The FOREST AND STREAM will have a special report of the race.

The judicial committee of the National Association of amateur oarsmen meet on the evening of August 16th, at the Metropolitan Hotel, to decide the question of Amateur oarsmanship, and to define "what is an amateur?"

The Gulick Boat Club is about to be disbanded, and a three-mile race to decide who shall retain the championship badge will be held on the Harlem on the same day that the Atlanta hold their regatta August 16th.

Messrs. Patrick Cummings and Robert Dugan have challenged the Tommy Brothers of Brooklyn, to a five-mile race, in seventeen-foot working boats, for from \$100 to \$500 a side.

The Toronto International Regatta will take place September, 3, 4, and 5. Five prizes are offered. The yacht race is on the third day; open to Canadian clubs only. Entries to be made on or before August 30th, to Mr. I. E. Robertson, Secretary, Queen's Hotel, Toronto.

Any man who shall, after the 2d of September, 1873, row for money, shall be considered a professional oarsman. The entrance fee for each race shall be five per cent. of the amount of the prize for each race.

There is every probability that the long talked of scullers race between Jno. A. Biglin of New York, and George Brown of Halifax, Nova Scotia, will certainly come off the last of the month, at Halifax harbor.

The following boat clubs are members of the Harlem navy: Nassau, Atlanta, Columbia, H. R. Club, Nautilus, Grammercy, and the Dauntless.

There is a rumor current that the Cooper Boat Club of Savannah and the Independents will row a four-oared race at Montgomery. The time is not fixed, but the event will take place within a week or two, if it takes place at all.

J. J. O'Leary of Worcester and Pandien Harrington of Springfield have signed articles for a three-mile scullers race for \$300, to take place at Springfield, Mass., August 20th.

The Horse and the Course.

HOTEL RACES.

It is questionable, whether the races in the proximity of New York, along the route of summer travel, have not been this season, run rather in the interests of the hotel keepers, than for the encouragement of the breed of that noble animal the horse. Monmouth course, near Long Branch, having been founded long before that watering place was ever thought of, is not subject to our remarks. Saratoga races may, however, we think, be classed as the typical hotel races. Of course Saratoga, is not exactly what Baden-Baden once was, but still there are some pretty strong traits of resemblance between our American watering place as it is to-day, and what Baden-Baden used to be. The health-giving water is there, the bands of music, the gambling, and the horse-racing. Of course the Baden horse-racing was always a ridiculous affair, and was looked upon by sportsmen in the light of a big circus, and not simply a feeder to the *rouge et noir*. Despite a wonderful amount of newspaper puffing, we think the most of our readers will agree with us, when we state that this years contests at Saratoga show all the ill effects of a noble sport under the exclusive control of hotels. It is perfectly natural for the proprietors of these hugh caravansaries, to bring into the high season of entertainment all the allurements possible, only it happens that those who know how to keep a hotel, may not be exactly competent to manage a race course. At the last race, but very few ladies were present. Some thousands of the sterner sex were there, but many thousands more kept severely away from the track, though in the immediate vicinity. Of course entries were made, and by the owners of the best stock in the country, but the management of the course, has not it is said, met their approval.

Still another subject, which we advance, with a certain amount of diffidence, it is true, fearing it may be entirely at variance with the interests of the hotel keepers, is this. "Why should we race at all in July and August?" These months are the season of the most terrible heats we know of. Is it because some of the leading races in England come off in these months, that we should kill horses in this country, putting them to the top of their speed, when the heat is equal to that of Bengal? There is time enough to run horses up to the 1st of July, then allow an interregnum of fully two months, and to start fresh in September.

Though our racing season is drawing to a close, it would be perhaps premature on our part to attempt to give as yet a thorough *resumé* of it. So far, however, we are pretty positive that the Saratoga racing for 1873 has not only been a decided failure as to the character of the sport, but what is far worse, its general management has been such as to lower the taste for the Turf in the United States.

SARATOGA RACES FOR THE LAST TEN DAYS.—The weather was fine, and there was a fair attendance. Five horses started, and Sunrise won cleverly in 1:44. A two mile race followed, with seven horses starting, which was won by Mate, who beat True Blue on the homestretch by only a neck. Time, 3:32½, which was remarkably good. The hurdle race was a wretched affair, and was won by Blind Tom. On Saturday, the 2nd of August, the leading event was a selling race for two year olds. There were only two horses started—Crow's Meat getting in ahead in 1:19½, which is a fair speed for a three-quarter mile race. The Sequel stakes claimed more attention, and was awarded to Mr. Belmont's colt "The Ill-used." The three mile for all ages was next on the list. McDaniel's Hubbard, Rice and

McCormick's Wanderer, the celebrated horse Harry Bassett, and C. Reed's Lexington made up the quartette. Hubbard won, hard held, coming past the post in a hand gallop; time, 5:34. Tuesday witnessed one of the largest assemblages of the season. There were no less than thirty odd horses nominated, but only eight came to the post. There were false starts without number. After a close and desperate struggle Mr. F. Morris' bay colt Battle-axe came in a clever winner by half a neck; time, 1:45½. Thursday, August 7th, was a very bad day, the rain having come down in torrents up to eleven o'clock, but by half past eleven the sun burst forth, and the track, though heavy, was in fair condition. Sixty-seven horses had been nominated for the Kenner stakes, and only eight started. Distance two miles. Springbok was the favorite, but Springbok gave in and left the contest to Ill-used and Strachino, the former winning by a short neck in 3:39. In the one and a half mile race which followed four horses started, Arizona taking the lead and winning cleverly by three lengths; time, 2:38. The third was a selling race, one and a quarter miles, ten horses starting. Mr. Sandford's very handsome horse Binghamman, who was so successful at Monmouth Park, winning by half a length; time, 2:10½.

BUFFALO.—The Buffalo trotting races were inaugurated August 5th. A great deal of money has been advantageously expended in improving the track and erecting commodious stands and stables. The immense amount of \$70,000 to be given in prizes naturally brought together a very large assemblage of horses and men. The first race was for a purse of \$4,000, for horses that had never beaten 2:34. M. and H. Nye's Mambrino Gift won three heats out of five, as follows—first heat, 2:26½; third heat, 2:27½; fourth heat, 2:30. The second race was for a purse of \$10,000, for horses that had never beaten 2:27. Eleven horses started. John E. Turner's bay mare Nettie won in three straight heats—time, 2:26, 2:22½ and 2:24½. On the second day it was estimated that over 18,000 people were on the ground, many ladies and gentlemen attending the race in their private carriage. The day was superb, and the track, though a trifle hard, in good order. The first race was for the \$20,000 purse, for horses that had never beaten 2:21. There were seven nominations, and only five contestants. Ben. Mace's Sensation won the three last heats—time, 2:24, 2:26½, 2:28. Fullerton won the first heat in the extraordinary time of 2:20½. The second trot was for horses who had never beaten 2:45. This was won by Grave's and Loomis' bay mare Clementine in the three last heats—time, 2:29½, 2:30 and 2:32½.

FLEETWOOD PARK.—August 11; Match \$1,000, mile heats, best three in five, to wagon.
John Murphy's b. g. Charley Green.....1 1 1
John Ellis's blk. m. Lady Byron.....2 2 2
Time—2:32. 2:37, 2:33.

The San Francisco *Examiner* publishes a rumor that the city has proposed to offer a purse of \$20,000 to be contested for at a great running race to come off in October, the conditions of which will be four miles and repeat, free to all horses in the United States, to rule; the first horse to receive \$12,000, the second \$5,000, and the third 3,000. The entrance to be ten per cent; for California horses, and 5 per cent. for those that may come out from the East—5 per cent. being allowed for expenses of transportation by rail from Eastern States.

Shot Gun and Rifle.

GAME IN SEASON FOR AUGUST.

Woodcock, *Scotopax Rusticola*; Esquimaux Curlew, *Numenius Borealis*; Ruffed Grouse, *Tetrax Umbellus*; snipe, and all kinds of Bay birds, including "yellow legs," "ring necks," plover, &c. Also such kinds of wild fowl as are strong of wing.

In the scorching summer days animals as well as men seek the leafy cover and the secret springs. There is little game to be found and little disposition to hunt. Taught by instinct, the tribes of fur and feather are recuperating from their duties of procreation and preparing to fulfil their future functions; just as our sportsmen should put themselves and their equipments in readiness for the coming fall shooting. Then the birds in their new finery, the deer tribe in their livery of blue, and the sportsmen in brand new cords, may walk forth into the tempered atmosphere of August with a zest and a joy doubly enhanced by rest and repose in the sultry, sweltering hours.

WOODCOCK.—The woodcock is exempted from the provisions of the prohibitory State law, which makes this month an almost universal close season. And even it should be included—for, though the young birds are plump and strong of wing, and fit for the bag and table, the old ones, subject to the laws of nature, and the exigencies of weather and of climate, are moulting. In fact they are feverish and sick, and should not be shot. They taste bitter, are unfit for the table, and by no means strong on the wing. Dogs can neither discriminate, nor can any but the thorough sportsman distinguish, between the old and young birds until both are brought to bag. The laws of Nature are arbitrary and must be obeyed, else men suffer the penalty. Game becomes scarce, and the sportsman's occupation is gone.

The favorite haunts of the woodcock are woods, moist thickets and coarse brakes, where they generally remain concealed during the day, but as soon as it grows dark they resort to moist meadows and swampy open grounds, where they search for bugs and insects, but more especially worms; they thrust their bills into the soft moist earth and

draw their victims forth, probably detecting their presence by the acuteness of their sense of smell. The nest is made of grass and leaves, near the root of a tree or bush. They lay usually four eggs—a yellowish white—blotched and spotted at the larger end with grey and brown. Notwithstanding the severe weather of the past winter, reports come in from several quarters of a more than average shooting. New Jersey being so easy of access to the city, and the feed, &c., by the side of marshes and streams in great abundance, that, with a better care on the part of our Jersey friends as to close seasons, one may shoot seven or eight brace in the early morning and evening.

Several gentlemen left the city in July, and report thirty birds to two guns in the vicinity of Pine Brook, New Jersey; another party in Orange county report sixty birds to four guns; another from the Summit Lake Club, Monroe, near Newburg, killed forty woodcock to two guns. A not uncommon incident occurred, which is sometimes improperly accounted for. The shooter was on one side of a narrow stream, and the setter on the other, pointing steadily; in a second or so two cocks rose almost simultaneously within a few yards of the dog. Now this was no fault of the dog, as he only moved his head, after the birds were flushed, to look round for his master to cross the creek. The dog had been hunted several hours, he was very warm, and a nasty, strong smell exuding from his body (so much so as to cause a remark from the gentleman present), and the wind blowing dead on the birds, it is fairly to be supposed they became alarmed at the strange smell and rose. It is indispensable that your setter retrieve well. As to wearing heavy boots all day long in this sultry weather, and picking up your own birds (a good many would be glad of the opportunity), it is a nuisance, except on special occasions. Moreover, you are very apt to flush other birds when you are little prepared.

RUFFED GROUSE.—The legal season for shooting the ruffed grouse, which is generally mis-called the "prairie chicken," varies in the several Western States where it inhabits. In Minnesota it begins August 1st, in Illinois, Indiana and Iowa, August 15th, and in Wisconsin, August 20th. The birds in Minnesota and Iowa are reported as being extremely abundant this year, and parties are organizing to make a raid upon them upon the 15th. However, we prefer to enjoy awhile longer the pleasures of anticipation, and wait until September. It is too hot now to be beating about in the broiling sun through the scrub oaks, or even to ride over the by-roads and shoot from the wagon.

SNIPES.—We hear of a few scattering snipe at Rockaway Beach, and Canarsie. The sportsmen are on the *qui vive*, and soon the banging of guns will be heard all over the marshes and meadows. A few were shot at Flatlands last week by Dan Hughes. They were very large and fat.

CURLEW.—This bird first makes its appearance in Labrador about the middle of August, on his migratory journey south, and is shot in great numbers along the strait of Belle Isle. A brief sketch of the curlew will appear in our next issue.

The shooting for the Lorillard badge, &c., at Saratoga, was unfortunately not of a very satisfactory nature, owing to the necessity of making it a two days' shoot. H. A. Brown, of Cleveland, Ohio, won the badge and part of entrance money.

Sea and River Fishing.

GAME FISH IN SEASON IN AUGUST.

Bluefish, (<i>Temnodon Saltator</i> .)	Striped Bass, (<i>Labrax Lineatus</i> .)
Salmon, (<i>Salmo Salar</i> .)	Trout, (<i>Salmo Fontinalis</i> .)
Sea Trout, (<i>Trutta Marina</i> .)	Black Bass, (<i>Centrarchus Fasciatus</i> .)
Grayling, (<i>Thymallus Signifer</i> .)	Land-locked Salmon, (<i>Salmo Gloveri</i> .)
Maskinonge.	

Though August is not the angler's month, *par excellence*, it is nevertheless the month of the year in which more varieties of fish are taken with angler's gear than any other, both in salt and fresh water. The fishing, however, except for bluefish, striped bass, black bass and moskinonge, is on the wane, and in those States where close seasons are fixed by law angling for salmon and trout is prohibited in September. In Canada rod fishing for salmon is forbidden under heavy penalty after the 31st day of August in the provinces of Ontario and Quebec, and after the 15th day of September in the provinces of New Brunswick and Nova Scotia. The catching of any kind of trout is prohibited between the 1st day of October and the 1st day of January. In Ontario, however, this restriction applies only to the variety known as "speckled trout," or brook trout. In the State of New York the close season begins on the 15th of September and continues until the 15th of March. This rule is, or should be adopted in all States east of the Rocky Mountains where trout or salmon are caught.

The past few weeks have been remarkable for the extraordinary good run of fish, both in fresh water and in the brine. We summarize:

BLUEFISH.—In all the bays and bights of Long Island Sound, in the Great South Bay, and in the waters outside, far away to the eastward, and down on the coast of Jersey, this splendid fish has literally swarmed. Set nets have taken as many as 6,000 in a single day. Several times vast shoals have been driven on the beach by porpoises and other large feeders, and been picked up floundering by the cart load. Other shoals have chased the shiners, sardines and anchovies close in to shore, and been "jigged" from the surface by the hundred into the boat. Trollers have taken large fish, weighing twelve pounds and more, while the average size of those taken in the nets and along shore has been about three pounds.

STRIPED BASS.—From the eastward along the Elizabeth Islands, off Rhode Island and Massachusetts, come marvelous stories of big fish. Mr. Willy Post took a monster weighing seventy pounds at Newport—so the rumor says—and yet striped bass have been taken (in seines) that weighed 150 pounds! But, egad! seventy pounds is a large fish to land on a trolling rod and fine tackle. Genio must look to his laurels. This rather overlays his "fifty-six pounds."

The striped bass have just begun to work their way down to this latitude, and will soon furnish grand sport. The veteran Andrew Clerk and his squire, Mr. Abbey, went down last week to the Jersey flats, their favorite fishing ground, but saw no sign. Bass, however, have been taken in limited numbers off the mouth of Coney Island Creek. About the 1st of September we shall hear from the main army, of which these are merely the advance squad.

On Friday last, below Communipaw, in Caven Channel, a striped bass weighing sixty-three pounds was caught. The fish are running remarkably heavy this year.

SALMON.—While we in many portions of the Middle States have suffered so much from drought as to cause the springs to run dry and the rivers to fail in their supply, the streams and water courses in Canada have been more than abundantly full; and as a high state of water (not too high) improves rather than deteriorates Salmon fishing, the season now closing has been unexceptionally good. The fish have been larger in size and greater in number. Indeed, they are said to have been more numerous in the St. Lawrence tributaries than at any time during forty years past. This gratifying improvement is undoubtedly due to the persevering efforts of the Government in restocking and protecting the rivers. In overhauling our data we note that General Arthur, of the New York Customs Department, and a friend, took upwards of 270 salmon on the Nepissiguit in the course of a month's fishing, the fish in nearly every instance being very large and fat. Two rods took 130 salmon in twelve days on the southwest branch of the Mirimichi. Ten different parties have visited this river the present season, and all had great success. One man killed thirteen in a single day. In this stream, as in the Nepissiguit, the fish were unusually large. In the Gaspé district Messrs. Clerk, Abbey and Stanton, of this city, had fair luck, considering that Mr. Abbey fished only a couple of days. They took fifty-four salmon on Grapd River within a fortnight, averaging thirteen and a half pounds apiece. The largest weighed thirty-two and a half pounds, caught by Andrew Clerk. Fred. Curtis, of Boston, has been fishing the St. John, (*du Sud*.) He took fifty salmon within a fortnight. Harbeck (Henry) has been trying his luck in the Romaine (Lord's River), on the coast of Labrador, and captured eighteen fish the first three days out. On the third day he took six fish before breakfast; but he kept a part of them for dinner. Dr. Patterson's score, on the Grand Caspédiac, Gaspé, shows forty-nine fish in eight days' fishing, twenty-one and a half pounds average; heaviest fish, thirty-five pounds. On the Moisie Dr. Hamilton, with Mr. Turner and friend, fished six days and hung up from ten to fifteen fish each day; unusually heavy. And so the fish have run throughout the Canadian waters. In Nova Scotia, however, some of the rivers have not yielded their usual returns. Gentlemen who visited Gold, Middle and East rivers complained that they took no Salmon, and only a few *grilse*. We have no private intelligence of the early fishing in those rivers, but the fact that the parties referred to took *grilse* shows plainly enough that the full grown Salmon had done running when the fishermen arrived on the ground. The editor of this paper has endeavored in vain to impress upon anglers the importance of going early to the rivers of Nova Scotia. Even February, with its running ice, is a more favorable month than June.

We have some strange intelligence from the lower St. Lawrence. A gentleman of high official position, who has been fishing the Ste. Marguerite, a tributary of the Saguenay, by courtesy of its lessee, Robert Hare Powell, of Philadelphia, gives a left handed compliment to the Hon. Dave Price, the owner of the fishing rights, who, it seems, is taking pay from anglers for fishing privileges, while reaping at the same time a pecuniary harvest from his set nets below. We quote bodily from the letter:

"We were the first rods on the river, and expected good sport, but partly owing to the high state of the water, and partly to the wholesale system of netting carried on at Tadoussac, we only killed one fish. I did not even get a rise. Mr. Price's people were taking one hundred and eighty in one haul at Tadoussac. There were several American gentlemen fishing with Mr. Powell on the Northwest Branch, and they were nearly as unfortunate as ourselves. They complained much of Mr. Price and his nets. It certainly does seem preposterous that a man who leases the river to other gentlemen, and calls himself a sportsman, should net so unremittingly, thereby totally preventing the fish from ascending the river."

Messrs. Green and Streit, of this city, who fished the other branch of the Marguerite in the latter part of July, took nineteen salmon in the course of two weeks, the set nets having been raised no doubt at intervals, or removed altogether for the season.

Of Salmon, in many parts of the world, it is said that they will not rise to the fly. As regards Newfoundland, this question may now be set at rest forever—for Newfoundland, like the Pacific coast, has been misunderstood and misrepresented, chiefly by reason of neglect to investigate the subject. A letter on our table, from an officer of H. M. S. cruiser "Spartan," reports having passed twelve days at Tassenger and Flat Bays, island of Newfoundland, in the course of which time many Salmon were taken by himself and shipmates *with the fly*. More would have been taken but for the previously high stage of water, which amounted to a freshet—water doubtless corrupted by the inflow from the melting snows which could then (June) be seen sheeting the tops of the high table-lands. The thermometer rarely rose

above fifty degrees. Many large rivers flow into the bays mentioned.

We have been disappointed by the non-receipt of a letter from the river Margaree, Cape Breton, one of the finest salmon rivers in the world, though but little known to anglers.

TROUT.—This delicious fish, in the sacrifice of its beautiful life, has afforded pleasure to thousands of anglers the past season. How many tens of thousands of trout must have been brought to land throughout the country. As far as the record shows, they are now increasing in numbers, thanks to the numerous means and measures adopted by States, pisciculturists and private persons to propagate the species. The Adirondacks still seem to hold precedence as a favorite resort for would-be sportsmen; and no wonder—for what other part of the globe can be found where all the appliances and luxuries of civilized life exist in the midst of primitive forests and primeval savagery? The wild cat wails under the gaslights of Paul Smith's caravansary; the red deer drinks from the reservoir that supplies the mains that furnish the guests with water; and in the tangled thickets of the wilderness swamp novices might be irrecoverably lost and uselessly advertised for, while jaunty petticoats are flaunted unconsciously along the beaten route not twenty rods distant. A rare combination this for the tyro, which permits him to *feel* the terrors of the jungle without being compelled to brave them—to enjoy the consciousness that he, with his guide, is *a part* of these weird, nerve-curdling experiences which will make his little brother quake and tremble at their mention when he emerges again into the settlements. Even Mr. Murray could not ignore the sublime sensation that was born of the thought that no human habitation stood within ninety miles of him, (as he states in his book.)

The reports from the Adirondacks are uniformly favorable. The stage of water has been good and the fish of usual average size. More visitors than usual have made their headquarters at Schroon Lake. Our correspondents from Pennsylvania note a marked increase in the number of trout caught this Summer. For two years past the close season has commenced on August 1st, under the State law, and although the streams have been fished more than ever, the trout seem to multiply; and doubtless the fishing will be still better next year. Two or three gentlemen who have visited the Cheat River country, in West Virginia, and the mountains of North Carolina and Tennessee, speak in glowing terms of the fishing there. The trout are not large, but very abundant. Next season we shall encourage our sportsmen to reconnoitre in this direction, for the scenery is of the finest in America, and the sport assures full baskets. In Wisconsin the Wolverines have their favorite resorts. Their streams are very clear and cold, as we have learned by experience, when, after wading them for a couple of hours we found our limbs so numb that they were useless to help us clamber up the banks. The following note, from Colonel Frank Hatch, a noted sportsman of the Badger State, mentions some of the best trouting localities:

LA CROSSE, WIS. JUNE, 1873.

Bayfield and Ashland, on the east shore of Lake Superior, can be reached by steamers from Duluth, in an eighty mile ride—or by boat from any point, on the chain of great lakes from the East. Of these two points Bayfield excels for easy access to various steamers along the Lake Shore, and beauty of scenery, and good fellowship. Here are good hotel accommodations, guides, boats &c., and splendid rock-fishing in going to and from the various streams that pour into the lake every ten miles. These streams admit of fine boat-fishing near their mouths, and splendid stream-fishing farther up. Very large trout are taken in these waters, many weighing three and a half and four pounds. Ashland has the same facilities, except it requires greater expense and trouble to reach the sporting grounds. Bayfield is considered the finest location on the lake, and here you can find a class of people that spread hospitality on a broad gauge plan. Refer to Sam Field's "Bayfield Press," Col. Wm. H. Knight, famous Jim Chapman and Gen. T. J. L. Tyler. I can only add that whoever likes to throw a fly, or use a landing net, will find all the sport they want at this point. Fishing in the interior of our State is fast playing out, on account of milling, logging and railway constructions. The best points to visit at present are Menomonee, Dunn Co., and Hudson. Both these points are reached by rail from Chicago over the North Western Railroad and West Wisconsin Road, in a twenty-four hour's ride. At Menomonee we find the famous "Tea Gardens" situated on Wilson's Creek, ten miles from M. This place is fast acquiring reputation for the *number*, more than the size of its trout. The Tea Gardens have an established hotel that is devoted to sportsmen who visit there. Aside from this, many other streams, all tributary to the Chippewa and Menomonee Rivers, are to be found in this locality—and chicken hunting in season cannot be surpassed. John H. Knapp of Menomonee will gladly give information concerning future developments. At Hudson the "Baldwin House," Amasa Walker proprietor, will attend to sportsmen, and in no place can a few months be put in better. Hudson is situated on the Lake St. Croix River, and all the streams are well stocked with trout.

Yours Respectfully,

FRANK HATCH.

BLACK BASS.—There are no finer black bass waters in the world than in the lakes of Wisconsin and Minnesota. A spoon, a gang, a scarlet fly, a bit of red rag, or a piece of pork, are all acceptable to this bold biter; and he is so gamey that when we have succeeded in landing a large one from our eight ounce bamboo, after twenty minutes play, we hardly know where to place our preference—whether on this cavalier in green and gold, or upon the dainty trout in his "speckled pride."

Bass fishing has been unusually good this season. Mr. A. G. Atkins, Secretary of the Caw Caw Club, has been doing a good business the past two weeks, having taken several hundred in Lake Winnebago with the fly. He brought fifty-seven to basket in a single day, which is heavy work for this species of game fish with light tackle. Let us see. Ten minutes to the fish—six in fifty-seven goes nine times and three over, which we will throw off for time. Nine hours steady fishing! Wonder if he stopped for lunch? We can't beat that here in the Middle States, but we notice that our bass fishing is improving, and that many lakes recently barren now give good returns, in consequence of their having been restocked. At Lyme, Connecticut, the bass fishing has been splendid. Anglers at Pharoah, Paradox and Schroon Lakes, Adirondack region, have had fine sport.

Some of the lakes of northwestern Pennsylvania have done well for the first time in many years.

Serpentine Lake, in Minnesota, and all the lakes around Brainard, within a radius of thirty miles, are alive with bass, waiting for gentlemen of leisure to come out and take them. Residents are too busy to give much time to sport. If the sportsman will take this month or the next he can combine bass fishing with "chicken" shooting.

The "Caledonian minnow" with large grabs, has proved a killing bait, and will become a favorite. The "Page fly," a nonentity with scarlet wings and shoulders of the guinea fowl plumage, almost always kills. Well—a bass will take anything when he is in biting humor.

We have been shown a trolling spoon which will take *fish*, and not catch weeds and lily-pads. The hooks gather in, and have to be compressed laterally to make them spring open. Pulling upon them lengthwise will not spring them. It is the snap of the "beggar's" jaws that does it, you know. Black bass are in season until ice comes.

LAND-LOCKED SALMON.—"Old sports" generally choose May for the capture of this fish, but the present month and the next are equally legitimate, and the weather and concomitants more pleasant. The "Schoolies" or St. Croix waters, that divide Maine from New Brunswick, are the preferred localities, but we like the Sebec Lakes equally well. Take the Piscataquis Railroad to the town of Sebec. Good hotel there, and a little tugboat on the lake. Medium sized flies, as large as those used for grilse—a combination of black and yellow, are the most killing. The house of Andrew Clerk, Maiden Lane, New York, has four new patterns, unknown except to a few experts. It is difficult to choose between the land-locked salmon-fishing of Maine and the bass-fishing of Wisconsin and Minnesota.

GRAYLING.—This is a game fish peculiar to Michigan, so far as is yet known, which has been recently added to the sportsman's repertoire. He takes the fly boldly. His haunts are most accessible from Bay City. We shall speak of him more explicitly in future numbers.

ANGLING FOR SHAD.—W. C. Prime and Dr. Thad. Norris seem to have constituted themselves delegates to decide the question whether the shad is a true game fish and free acceptor of entomological invitations when offered. We take decided ground with Mr. Prime, who maintains that they are, and with the more natural reason that fly fishing for shad was a favorite amusement of ours a dozen years ago in the Savannah river, at the head of the canal above Augusta. Fine sport could always be found on the rapids in the spring. We used a brownish fly always, and fished in the early part of the day or at evening—not because we knew that the shad would not take a fly in mid-day (for we didn't), but because the sun was too powerful for comfort.

Military News.

Desertions among the enlisted men of the army for years have been very numerous; in fact they have increased so rapidly that it is time the government instituted a board of competent officers to investigate the why and wherefore of this reduction of the army. As it is, a large part of the time of general courts-martial is occupied in the trial of enlisted men, the majority of whom are charged with desertion. We hope the case of 1st Lieut. George J. Madden, of the Eighteenth Infantry, who was "dropped" from the rolls of the army for desertion is not proof that the infection is extending to the ranks of the officers. A natural inference is that this officer has committed some offence so gross in character that he preferred desertion to trial by court, and the inevitable dismissal from the service.

Major General Winfield S. Hancock, commanding the military division of the Atlantic, headquarters New York city, has changed somewhat his personal appearance since the time he was wont to be termed the "handsomest officer of the army." The invigorating air of Minnesota, his previous department district, has added much flesh to bones, and he now presents in body the rotundity of a first-class "city father." All of which comes, we presume, of Regular habits.

The dashing General Custer, Lt. Colonel of the Seventh Cavalry, has been "docked" the large sum of twenty-three dollars and fifty-seven cents by the War Department, for using the wires too much when the pen would have been more economical to the Government. The freedom of "Life on the plains" will sometimes make officers as well as other people reckless in expenditure. Still as the publishers of the *Galaxy* are gradually making the General rich, we presume so small a "dock" will not trouble or inconvenience him in the least.

Adjutant W. W. Cook, of the Seventh Cavalry, has been granted leave for six months, to "cross the sea." He will take less time than this, of course, in crossing, but he won't come back and assume the duties of chief until the expiration of that time. He is not, to our knowledge, on any Government business.

A board comprising Lt. Col. S. B. Holabird, D. Q. G., Major A. P. Morrow, Ninth Infantry, and Captain W. T. Gentry, assembled at San Antonio, headquarters Department of Texas, on or about August 15th, to locate sites for forts and military posts, which the Secretary of War has been directed to purchase. In case of a rupture with our old friend Mexico, the Government deem it expedient to be well prepared along the Rio Grande. In times of peace prepare for war—right in this neighborhood.

Promotion being too slow, 2d Lieutenant Chas E. Slade has resigned from the Fifteenth Infantry.

General Stanley is in a fair way to establish a reputation

that will far outlive that of his journalistic namesake, the Livingstone discoverer. The Yellowstone expedition, under this intelligent commander of the Twenty-second Infantry, is making great progress, and recent information from headquarters of the Yellowstone expedition at Camp Pearson, announces that the steamer Josephine had succeeded in traversing the Yellowstone river seven miles nearer its source than General Forsyth in the Key West last spring. Colonel Ludlow, of the engineers, is of opinion that the Yellowstone river is navigable as far as the Big Horn, located some 200 miles up the stream. The "expedition" troops have had a rough time thus far, the route being poor and lands bad; still as far as can be seen from the advance of the expedition, the Yellowstone valley presents a beautiful level prairie, and the engineers expect to make good progress. This Yellowstone region of our country abounds in natural wonders, and the amount of scientific and general information to be derived by this army exploration will be of vast importance to the Government and the people. General Stanley July 28th started for Pompey's Pillow and Mussel Shell Shoals, taking with him fifty day's supplies, and expects to return about the middle of October.

The infantry troops are now "trying on" the new infantry equipment, and commanding officers are reporting how the new thing works.

The Yale geological exploration party is on its way to Fort Bridger, where a month will be spent in examining the geological formation of the Wasatch range. A detachment of the second cavalry, (Co. I,) under Captain W. A. Jones, left camp Brown, Wyoming, July 12th, where they had halted for ten days. The object of this exploration is to ascertain, if possible, a wagon road of approachable nature from Wind river and the Shoshonee reservation over the mountains to Mt. Ellis, by way of Lake Yellowstone. If this exploration is successful, the whole trade of Montana, already quite extensive, will take the Wyoming route from the Union Pacific Railroad, and the great national park will be brought within the reach of pleasure seekers without their being compelled to undergo the tedious navigation of the Missouri, or costly route *via* Corinne and Helena. The Gregg expedition, under escort of Co. C, Second Cavalry, are *en route* up the valley to the North Fork, thence by the head of the Lone Pine creek to the Niokara, at the mouth of the Rapid river. Near Evergreen run this expedition discovered a tract of land covered with heavy pine timber, and the value of this discovery cannot be overestimated. On reaching the Niokara, at the mouth of the Rapid, they found a stream 100 yards in width, heavily timbered with pine and cedar. The existence of wood in this part of Nebraska had never before been suspected, and as the land around is reported as rich, well watered and abounding in game, it will undoubtedly stimulate settlement in these parts very soon.

These expeditions are of vast importance to the country, and the army is performing a great service in protecting and assisting these many exploring parties.

The largest portion of the United States troops are enjoying camp life, and in many instances it is found far more enjoyable than any of the numerous watering places. A correspondent of the *Army and Navy Journal*, writing from the camp of Co. D, Third Cavalry, located on a bluff of the Laramie river, among other things, says: "The tents are covered with shade, making them very comfortable. The weather so far has been delightful, and we have no desire to exchange places with those who frequent your watering places. Daily mounted drills, target practice with carbine and pistol, vary the monotony which, when the Laramie was high, was more varied by the excitement of swimming the horses across the river, an exercise useful, exciting, and a very necessary part of the cavalry drill. Nearly all the horses swim well. One came near drowning, owing to his driver pulling on the bit, which should never be done. The horse got his front leg over the rein, and commenced going down; his face was one of dark despair. At this time "stable call" was sounded, when the despair changed to a bright hope, the noble brute continued to struggle, and finally got out. The change of expression of the beast's face from dark despair to bright hope would have been a picture for an artist. The rider who could not swim was dashed into some brush and got ashore, and a horse nicknamed "Pontoon-bridge," from his good swimming, was sent out for him."

The Canadian rifle, known as the Duval Macnaughtan, has been tried at Wimbledon, and has elicited marked expressions of praise from the metropolitan press.

Art and the Drama.

IN spite of the leading idea of our paper, which is to take our readers once a week into the shades of the "forest," and lead them meanderingly beside the flowing "stream," still we have an allotted place for the beautiful and fascinating associations of the Drama and Art.

Nature, delighting in opposites, inspires her true love with the keenest enjoyment at the display of an excellent theatrical representation. The very contrast of the gas-light creations with his honest out-of-door experiences, necessarily leads to this result. If you would have genuine disquisitions upon the intrinsic merits of the Drama, listen to the discourses of the cultured and gentle sportsman on the subject, while beguiling his time at a "deer stand," or, to the disciple of the "rod and line," who gives his reminiscences of the stage while engaged in the glorious work of making a "red palmer hackle" to ensnare the gem speckled trout.

Professing no real sympathy for the "Sensational" Drama, and indulging the hope that the "society play," (a kind of

monstrosity that generally makes the leading actresses mere frames on which to hang costly dresses, or worse, representatives of those gilded vices from which originate the unhappy women of the town,) has had its meridian, and will soon give way to better things. And disclaiming all desire to attempt the part of a reformer, save by good example, we shall in our limited allotted space, note from time to time such excellencies as appear in our judgment worthy of praise, and endeavor to do it with fairness, and in details sufficient to keep our readers posted upon the really noticeable dramatic events of the day.

Our summer, which is rapidly passing into the sere and yellow leaf of fall, has been theatrically dull to a degree quite without precedence. The noble ambition of some of our "sensation sheets," to get up a cholera scare, has had the effect of putting New York for weeks together in quarantine, not at the mouth of the harbor, but through the absence of our country friends from every highway that led to "Rome." Never was our city blessed with more general health, neither was it ever more justly entitled to the name of a first class summer watering place, yet days and days passed in July when our best hotels at the dinner hour often had fewer guests than attentive servants standing at the backs of the empty chairs.

Amusements were almost suspended; not a place of negro minstrels, was, nor is yet opened! Mr. Boucicault, who announces over his own signature, that he is the greatest actor living, kept up a fair house at Wallack's, while the players of Wood's Museum supported lively performances, made up of incidents of backwoods life, the real enactment of which in the lava beds, culminated in the Modoc war.

Two or three weeks ago, in our desperation to oblige a country friend with sight of a play, we visited the "Bowery." The thermometer inside the house must have been one hundred and eighty, at least, for we saw spirit boiling in the faces of the audience. The building was crowded to excess; the gentlemen who abated the nuisances around Washington and Fulton markets, might have been inspired by the seething atmosphere, with the idea that "something ought to be pulled down." The play, however, was healthy and had a good moral. The Madeline Morel and Frou Frou schools evidently have not reached the "East Side" of the town. The poor and simple folk of that benighted region are old fashioned enough to look upon the traits and misfortunes of a virtuous and well meaning people with the greatest interest and greeted their final triumph (in the play) with absolute enthusiasm. Would it not be well for Wilkie Collins to commence his lecture tour in this country from before the foot lights of the "old Bowery"? or, would the fair sex present, take the elaboration of the First Magdalen as an insult? If borne with by this gracious art he might coin money, and do missionary work at the same time.

The opening season promises well for our disquisitions. In our Metropolitan city, strange as it may appear, the Grand Opera never has had a promising existence, yet this fall and winter we are to have two combinations, each one advertised conspicuous for the possession of distinguished artists. If the music is really good; and the terrible peddlers of bouquets and pamphlets are not altogether unbearable from their officiousness, and the public is benefitted by the rivalry, we hail the event with the greatest satisfaction; yet we have been so often disappointed we indulge but little hope. The old routine we fear will be repeated; full dress, kid gloves, extemporized liveried servants, policemen bawling for coaches, hustling in the corridor of the Opera House; this for a few weeks, and then a relapse into silence, to be followed by memories of unsatisfactory experiences, and money gone to the dogs.

The Italian Opera not being a plant of the cactus genus cannot stand firm with its roots in dry sand, and live on air. On the contrary, the opera wants an immense amount of fertilizing material in the form of green-backs, and under the most favorable circumstances in New York city it is a most miserable exotic. We fear it will never be thoroughly acclimated, until something is done to put it in possession of the people at large. This powerful organization in this country builds up and sustains not only our great material interests, but our asthetic projects. Among its members you find creators of railway routes across the continent, and the most enthusiastic and judicious supporters of Art.

The accepted operatic lion for the hour is to be Signor Tamberlik. This gentleman it seems, now that he is engaged for "the season," is pronounced by his especial friends (the managers and the Bohemians) to have the most extraordinary tenor voice ever listened to, his upper notes on the stage reaching to C sharp in *altissimo*, and off the stage to the still more astonishing elevation of 35,000 francs per month! and furthermore, he is said to possess "more force" than Mario, and "less bounce," than Wachtel.

Signor Tamberlik, we judge from the preliminary notices of his advent, has been doing nothing for the last thirty years, but rehearsing in foreign capitols to perfect himself for this professional visit to New York. Knowing from hearsay how pernicious are our *national airs* to the Italian voice, he has evidently endeavored to gradually acclimate himself by singing for many seasons in all the magnificent towns of Central South America, and for the last two years in the dilapidated Tacon at Havana.

Old Knickerbocker, in one of his greatest historical compositions, records a case of unfortunate ambition, in the person of a athletic dutch man, *who got out of wind entirely*, by running a full mile to acquire momentum enough to jump over a ditch nine feet wide. If Signor Tamberlik has been over thirty years preparing to come here, it is no wonder he has not the "bounce" of Wachtel. We regret that he did not test the good nature of our audiences say fifteen years ago; the young-lady critics would have forgiven his

thin want of culture, for the sake of the advantages of a youthful person and face.

On the 11th instant, the charming comedians known as the Vokes family, opened at the Union Square Theatre, in a new play entitled "Fun in a Fog." A full house as there should have been, greeted the performance. The charming visitors deserve a long and successful engagement.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

"UNDER THE GREENWOOD TREE."—Hall & Williams, New York, Leisure Hour Series.

As you open the book you read, "To dwellers in a wood, almost every species of tree has its voice as well as its feature. At the passing of the breeze, the fur trees sob and moan no less distinctly than they rock; the holly whistles as it battles with itself; the ash hisses amid its quiverings; the beach rustles while its flat boughs rise and fall. And Winter, which modifies the note of such trees as shed their leaves, does not destroy their individuality." On a cold and stormy Christmas-eve, less than a generation ago, a man was passing along a lane in the darkness of a plantation that whispered thus distinctively to his intelligence. All the evidences of his nature were thus afforded by the spirit of his footsteps, which succeeded each other lightly and quickly, and by the loveliness of his voice as he sang in a rural cadence:

"With the rose and the lily
And the daffodown dilly,
The lads and the lasses a-sheep-shearing go."

But here we must leave him, to his interview at Tranten's—and he has fully laid down in this very interesting "Leisure Hour" under the greenwood tree, one of the most lively and imaginative wood-paintings of the Dutch school. We find many of Tranten's opinion, in this world, who cannot see why a "violin or fiddle is much nearer heaven than a clarinet." It brings back to our mind the memories of our boyhood when we sat perched up in the old Unitarian church, (congregational by courtesy) our short legs not nearly touching the floor, and our eyes literally sticking out with wonder, one day, when a new big bass-viol made an unheard of innovation in the village choir. Our own astonishment was not greater than De Frosts, the chorister. At sight of this "big-fiddle" he threw away with disgust his big oaken pitch pipe, and refused all aid so far as accompaniment went to this "device of the devil." Then to think of all the after times of the good things that come off in the "choir"—"Going the rounds," "The Listeners," "Christmas morning," and what happened then. "The great Tranten's party," "O yes, stop till the clock strikes" and they did stop, and it was not a sit still party. Dick was there, and Dick's partner was a girl named Lizzy, and—well readers please get the interesting work and read it and thank us for telling you of it.

"TWENTY THOUSAND LEAGUES UNDER THE SEAS."—Published by Geo. M. Smith & Co. 11, Bromfield St. Boston.

Of this book it may truly be said, it is deserving a place beside the "Arabian Nights Entertainment," or the "Hundred and one Stories of Paris." We have seen no book recently, which has attracted the attention that these submarine stories have done. It is a charming book for a hot afternoon in the shade, or to read at the sea-side. No one would be likely to get to sleep over its lively wide-awake stories. We had thought De Foe's celebrated "Robinson Crusoe" a work without a parallel, but we must place on the same shelf in the library of "wonder books" this voyage under the seas. In course of our reading the same, we soon came to the conclusion that to be astonished at any one of these remarkable stories would be out of place, and we made up our mind that "seeing was believing," and have we not these wonderful illustrations, one hundred and fifty of them, before our very eyes? These stories are told with such a profound confidence, too, that we as truly believe in them as in the remarkable travels and adventures of Gulliver, or the "Arabian Nights Entertainment." Were our submarine explorer to meet a "big turtle" clad in complete iron armor, with the date of the year in which it was forged, instead of his natural shell, we should of course believe it, and, would on no account spoil this delightful romance, by questioning the slightest tittle of the whole. We swallowed the whole, as we would an oyster, and recommend the same to all lovers of the wild and wonderful, as a very choice collection of never before written stories. This work is sold only by subscription—and agents are wanted everywhere for its circulation.

"THE TOUR OF THE WORLD IN EIGHTY DAYS."—By Jules Verne—James R. Osgood & Co., Boston.

This is a delightful book for summer reading. Just the book to take out of one's pocket, as he lays upon his back under the shade of some fine large tree, just the book for a weary man, not to be supposed that all will be lazy, who read it, for the translator Mr. Fowle, has kept the lively scintillating style true to the life. The book, like the ocean breeze, will be found easy flowing and varied, full of ever changing incident, from the time twenty-nine minutes after eleven o'clock A. M. Wednesday, October 2d, when Passepartout became Phileas Fogg's servant, until the ending of the great ice-sledge ride. The reader does not journey quite so fast, yet his imagination has little time to lag, or rest, and one strange or droll incident after another, enlivens every page of this racy little volume. All is well that ends well, and the many readers of this book will be well pleased with its finale.

THE CANADIAN MONTHLY AND NATIONAL REVIEW.—We are indebted to the enterprising publishers—Messrs. Adam, Stevenson & Co., Toronto, Canada—for beautifully bound volumes of this periodical, embracing the issues for 1872, the initial year of its existence. We confess our surprise as well as gratification to find in it a magazine so exquisite in typography, and so captivating in its general contents; being in all respects worthy of any literary centre in either hemisphere. Its contents are varied, and embrace vigorous and thoughtful papers in biography, criticism, travel, science, political economy, romance and poetry. No higher evidence than this magazine affords, is needed to impress the public with the intellectual life and progress of the Dominion of Canada, and no finer medium exists through which our people may familiarize themselves with the resources and capabilities of a country which, though our neighbor, is to a vast majority of our people almost a *terra incognita*. Canada presents many features of special interest to the people of the United States, and a better knowledge of its people, its institutions, and picturesque natural attractions, no less than the selfish incentive of closer commercial relations, are all objects worthy of encouragement. Therefore we most heartily commend this Monthly to our readers, and hope it will extend its circulation widely throughout our borders. We regret that we do not find the subscription price stated, but specimen copies may be obtained by addressing the Publishers. The August number of the current year has just come to hand.

AVILUDE.—This is a charming little game adapted to children, by means of which, certain ornithological ideas may be acquired. The illustrated cards of birds are neatly printed, and the printed text just sufficient to make it an interesting game. Natural history is so little taught, that any new method of introducing this most useful study, should be welcome. West & Lee of No 10, Main street, Worcester, Mass., are the publishers.

Current News.

Southerners are quite numerous at Cape May this season.

There is to be a grand four-ball American game billiard tournament this fall.

It is estimated that a volcano, long extinct, has broken out afresh in Colorado.

They are experimenting with female horse car conductors in Savannah.

There is no doubt that gold has been discovered in Alaska in paying quantities.

Wild horses are abundant in southern Kansas, and several parties of hunters are after them.

A black drum-fish weighing fifty-six pounds was caught off Robbins Reef, Staten Island, last week.

Ten thousand dollars in premiums will be offered at the Friendship Driving Park, Pittsburgh, August 27th.

Teresa Carreno, the American pianist, has just been married at London to the young violinist, Emile Laurent.

Antoine Ravel, of the famous "Ravel family," so popular in America some twenty years ago, died at Toulouse recently.

Dr. McGregor Jones, at Dexter, Me., has a trout in his well that is forty-six years old. He was placed in the well he owns in 1827.

The Boston Journal says that about twenty-five thousand residents of that city are now absent, of whom about a thousand are in Europe.

It is reported that Anna Dickinson is going upon the stage, and that she will make her debut in a dramatic version of the Scarlet Letter.

The game of pall-mall, now obsolete in England, has been played in Montpellier, (France) uninterruptedly for the last four hundred years.

The genuine tea plant is now grown profusely in all the gardens of Jacksonville, Florida, and some residents use no other tea in their families.

An enterprising dog in Utica secured samples from the clothing of eight lightning rod agents within half an hour after a thunder storm the other day.

The best game in Persia is the argali or wild sheep, a large animal, with a peculiar mane, its horns measuring four feet, and weighing alone fifteen pounds.

The cattle disease is raging in Missouri, and several thousand head have been carried off within the past three weeks. In one county the loss amounts to over \$50,000.

A gardener in England claims to have discovered a method of varying the colors of flowers by means of chemical applications to the earth in which they grow.

An Indiana county fair offers prizes of \$5 for the two handsomest babies of each sex, to be placed on exhibition, and prizes of \$10 for the fattest pigs and calves.

The editor of an Illinois paper thinks fishing, as a general rule, don't pay. "we stood it all day in the river last week," he says, "but caught nothing—until we got home."

Some one tells a story of a steamboat passenger watching the revolving light of a light house on the coast and exclaiming, "Gosh! the wind blows that light out as fast as the man can strike it."

Oregon appeals earnestly for laws to protect her valuable salmon fisheries. The fish are much decreasing year by year, through wanton destruction and sheer negligence of proper protection.

Hayseed in the hair and blue drilling overalls are to be the prevailing styles for Western politicians this fall. It is said that the accession to the ranks of farmers for the last two months from gentlemen that never before scented clover, is something wonderful.

Mrs. Josephine Jameison, a native of Virginia, who died in Brooklyn last week weighed over five-hundred pounds, and after death the body had swelled to such an enormous size that the undertaker found it impossible to remove it through the front door.

Thirty-nine short-horned cattle were sold at auction on Tuesday last at the farm of George M. Bedford, in Paris, Kentucky. The average price of the herd was \$857.50 each. One bull brought \$4500, and another bull, the Eleventh Duke of Geneva, was sold privately to Mr. Murray of Racine for \$7,000.

The rush of American travel to Europe is now over. Footings of the departures from this port for what may be called the "season," are, for the present year, 18,533, and those for (nearly) a corresponding period in 1873 are 18,033. This does not exhibit the increase in travel which has been expected, considering the attraction of the Vienna Exhibition, and the fact that three new lines have gone into operation since last summer.

W. E. BOND'S

IMPROVED SECTION BOATS,

FOR

Exploring, Traveling, Hunting, Fishing, Trapping, &c.

PATENTED AND PATENTS APPLIED FOR.

The following are some of the advantages of these boats.

1st—There is no possible danger of the sections coming apart. These boats are just as rigid under any kind of a strain as a whole boat would be. Hundreds of them are in use, but no case has occurred where they have come apart.

2d—They are as speedy as a whole boat; the joint does not perceptibly decrease their speed.

3d—It is almost impossible to make a hole in the sides. It has actually been proven that a blow which will split the sides of a wooden boat from end to end, only makes a dent in these boats.

4th—In durability they are immensely superior to any wooden or paper boat. Chafing against sand, rocks, ice, or even grass, makes the latter all but useless, but on these boats has little effect.

5th—They have in many instances supplanted the others, and as their merits become more fully known, will, for many purposes, almost entirely supersede them.

1873. BOATING SEASON. 1873

WATERS' PATENT

—IMPROVED—

Paper Boats

FOR

RACING, EXERCISE, PLEASURE, SHOOTING OR TRAVELING.

The inventors having during the past six months given their entire attention to their manufacture, will with this season, introduce our IMPROVED PAPER BOAT, in the construction of which great improvements have been made, overcoming all objectionable features which have been developed during the past six years. We refer with pleasure to the record of the past.

Our boats have been wintered and summered in both hot and cold climates, rowed in both fresh and salt water, yet after five, and in a few cases six seasons of steady use, these boats can be shown as serviceable to-day as when first finished. They were awarded the FIRST MEDAL AND DIPLOMA OF THE AMERICAN INSTITUTE, at its Fair held in New York in October, 1869, and for racing and training they are preferred to those of wood by numerous boat clubs and numbers of the best oarsmen throughout the United States, having since their introduction been rowed by the winners of THREE HUNDRED AND TWENTY NINE MATCHED RACES.

ATTENTION! SPORTSMEN!

N. Y. State Sportsmen's

ASSOCIATION.

Report of Committee on Stan-

dard for Shot.

Your Committee have the following report to make on the adoption by shot manufacturers and sportsmen of a uniform “AMERICAN STANDARD” of Drop Shot.

We have corresponded with all the manufacturers in the country, and most of them express a willingness to conform to the standard which shall be promulgated by your Convention.

All manufacturers will have eventually to conform, when sportsmen require that their shot shall compare with the standard of excellence which your Committee has fixed.

Upon the most critical examination, your Committee have decided to adopt as the “AMERICAN STANDARD,” the scale presented to us by Messrs. THOS. OTIS LE ROY & CO., of New York, as follows: (Here is given the scale, which can be had, on application, from Messrs. Thos. Otis Le Roy & Co., New York.) The number of pellets as given in the standard, is the correct number of PERFECT shot which will be produced by the given scale of each size.

R. NEWELL, Chairman.
N. M. SMITH,
F. G. SKINNER.

I hereby certify that the foregoing is an extract from the minutes of the meeting of the New York Sportsmen's Association of June 11, 1873.

JNO. B. SAGE, Secretary.

Sportsmen's Goods

To American Sportsmen,

AND DEALERS IN SHOT.

“American Standard.”

As the New York State Sportsman's Association has adopted a Scale of Sizes for shot under the above name, it will be some satisfaction to our friends to know that the standard of diameter adopted is nearly identical with that which we have always used. The only material difference consists in reducing the smaller sizes, known as Nos. 11 & 12, and the larger sizes heretofore designated under the letters “B” and “T.”

As the new standard (which we of course adopt as to diameter) would in this respect deprive our friends of several sizes which they have heretofore used with advantage, we have concluded to supply them under another letter of which we will give timely notice. The number of pellets given in the standard for an ounce does not correspond with the diameter; it is, therefore, impossible to adopt both.

The resolution adopting the new standard, although passed June 11th, was not mailed to us until July 7th—nearly a month after it had been given to another firm, who have thus been enabled to brand their bags “American Standard,” and to exclusively advertise the report of the Committee as a recommendation of their shot for “superior excellence,” as compared with that of all other makers!

Whilst the Report of the Committee may not be fairly open to the construction which has been ostentatiously put upon it, its ambiguous phraseology is calculated to convey the belief that the Committee after “the most critical examination” of all the shot made in the U. S., has adopted a standard which was substantially new, and not supplied by any makers of shot but the parties named.

We are now officially informed that the committee did not intend to recommend any particular make of shot above any other, but merely adopted the scale presented to them.

It is unnecessary to remind experienced sportsmen that the practical excellence of shot does not consist in the standard of size by which it is called; nor in the number of pellets in the ounce, but embraces other important features which cannot be appropriated by the adoption of a name, nor by any cunning deception. We gladly accept this opportunity to assure our friends that the well-known character of our shot will be carefully maintained, and in some important respects improved; and we feel confident that it will be found in practice to be more uniform, heavier, cleaner, and more effective than any other; and thus commend itself to the favorable opinion of all who use it.

CHEAP PLEASURE EXCURSIONS TO Lake Superior,

By COLLINGWOOD AND LAKE SUPERIOR LINE.

Chicora, Cumberland, Frances Smith.

The Finest Line of Steamers on Canadian Waters.

During the month of August, cheap excursion tickets will be issued by this line, good for any of its steamers either for the whole trip, or for any part of it, if passengers prefer to lay over at any point of the route.

The Captains have been instructed to take all the inside picturesque channels of the route, and to lay over at points of interest to allow time to the excursionists to land or to enjoy the sport of fishing.

Spacious private parlors can be secured on each steamer for family parties. The tables are replete with every delicacy of the season.

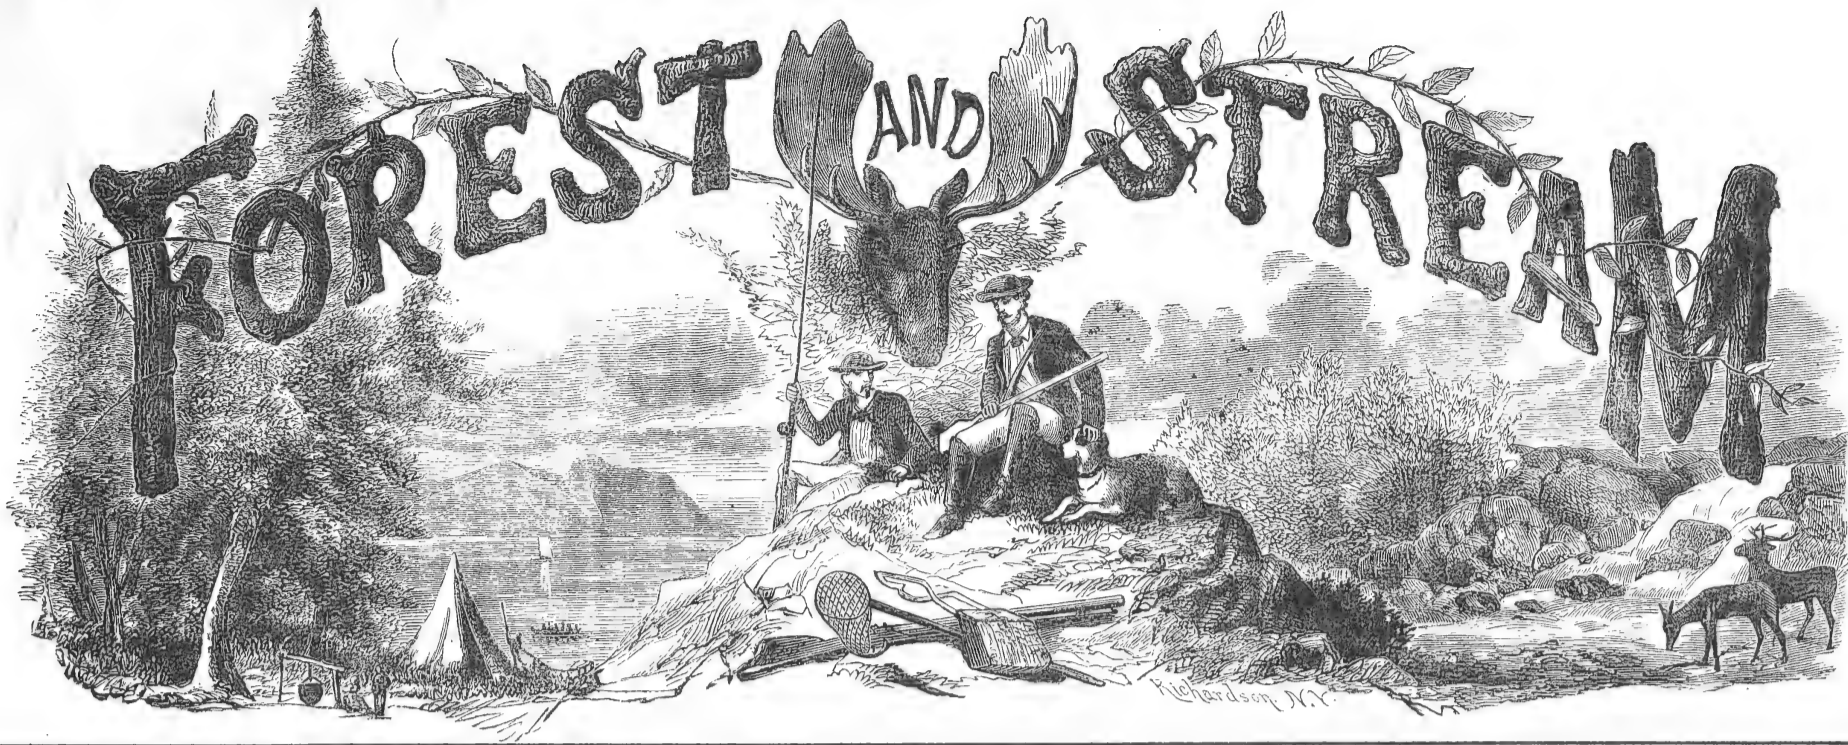

Leave Collingwood every Tuesday and Friday at 4.30 P. M. on arrival of “Steamboat Express Train,” connecting with all Morning Trains or Steamers, east and west, arriving in Toronto.

The cheapest, coolest and most delightful summer excursion on American waters.

THE DRUM FISH.

IN the Chesapeake and her tribute streams,
Where broadening out to the bay they come,
And the great fresh waters meet the brine,
There dwells a fish that is called the Drum—
A fish of wonderful beauty—and force,
That bites like a steel trap and pulls like a horse.

He is heavy of girth at the dorsal fin,
But tapering downward keen and thin;
Long as a salmon, if not so stout,
And springy and swift as a mountain trout;
For, often at night, in a sportive mood,
He comes to the brim of the moonlit flood,
And tosses a glittering curve aloft,
Like the silver bow of the gods—then soft
He plashes deliciously back in the spray,
And tremulous circles go spreading away.

Down by the marge of the York's broad stream,
An old darky lived, of the ancient *regime*.
His laugh was loud, though his lot was low;
He loved his old master, and hated his hoe.
Small and meagre was this Old Ned,
For many long winters had frosted his head
And bated his force and vigor;
But, though his wool all white had become,
And his face wrinkled up like a wash-woman's thumb,
And his back was bent, he was thought by some
A remarkably hale old nigger.
But he suffered, he said, from a steady attack
Of misery in "de head and pain in de back,"
Till his old master gave him "his time to hisself,"
And the toil-worn old bondsman was laid on the shelf.

Happy old Edward! his labor was done,
With nothing to do but sit in the sun,
And free to follow his darling wish
Of playing the fiddle and catching his fish.
He had earned his play-time with labor long,
And so like the other Old Ned in song,
He "laid down the shovel and the hoe,"
And caught up the fiddle and the bow.

Now, I cannot say
That his style of play
Would suit the *salons* of the present day;
For the *tours de force* of the great Paganini
Have never found favor in "Old Virginny."
He never played a tune that "went slow,"
For he perfectly scorned an *adagio*;
But, with eyes half closed and a time-beating toe,
His elbow squared, and his resinous bow
Not going up high nor going down low,
But saving quite steadily just in the middle,
He played by the rule
Of the strictest school
Of the old-fashioned, plantation nigger fiddle.

It happened Old Ned went fishing one day,
And out on the blue,
In his dug-out canoe,
He carried his fiddle along to play.
Long he fished with his nicest art:
There came not a nibble to gladden his heart;
So he tied his line to his ankle tight,
To be ready to haul if a fish should bite,
And seized his fiddle. So sweet did he play
That the waves leaped up in a laugh of spray,
And dimpled and sparkled as if to move
To invisible water nymphs dancing above.
But slower and slower he drew the bow,
And soft grew the music, soft and low;
The lids fell wearily over the eyes;
The bow-string stopped, and the melodies;
The last strain melted along the deep,
And, Ned, the old fisherman, sunk to sleep.

Just then, a huge drum, sent thither by fate,
Caught a passing gleam of the tempting bait,
And darted upon it with greedy maw,
And ran the hook in his upper jaw.
One terrible jerk of wrath and dread
From the wounded fish, as away he sped
With a strength by rage made double,
And into the water went Old Ned—
No time for any "last words" to be said,
For the waves settled placidly over his head,
And his last remark was a bubble.

Let us veil the struggle beneath the brine
Of the darting fish and tangling line.
The battle, of course, was a short one, since
Old Ned not gifted with gills or fins,
And down in the deep, was as much out of place
As a mermaid would be in a trotting-race;
And motionless soon at the bottom he lay,
As mute as the fiddle that floated away.

They were washed ashore by the heaving tide,
And the fishermen found them side by side,
In a common death, and together bound
In the line that circled them round and round—
So looped and tangled together
That their fate was involved in the dark mystery
Of which was the catcher and which the catchee;
For the fish was hooked hard and fast by the gill,
And the darky was lassoed around the heel,
And each had died by the other.
And the fishermen thought it could never be known,
After all their thinking and figuring
Whether the nigger a-fishing had gone,
Or the fish had gone a-niggering!

INNES RANDOLPH.

ANTICOSTI.

THE JOURNAL OF A NAVAL OFFICER.

[Continued from our Last Issue.]

DAYLIGHT found us becalmed, and drifting west with the current. The only consolation we could get out of the captain being rather depressing than otherwise, he having been once three weeks in making the same passage. In the forenoon a shoal of porpoises working up the gulf in long succession, and a shoal of whales sporting on the tranquil surface of the sea, reminded one of the oft-mentioned sea-serpent. Our rifles were called into requisition, but apparently our shots fell harmless, till Flanigan, rather put out at our skill, begged the loan of a gun. Kneeling down he waited till a "hammer head" (easily distinguished by the length of time they remain under water and their heavy spout on coming to the surface) appeared, when, taking long and deliberate aim, he pulled trigger. Unfortunately, he had forgotten one most important element to success—the rifle was at half-cock, and before he could rectify his mistake the whale had gone down. We laughed heartily at his discomfort, and his vanity was not a little hurt. "Och! what a pity," said he, "shure, thin, I had him intirely covered." Soon after he got a shot, and as the ball struck the water, certainly in close proximity to a whale, he jumped up in a frantic state of excitement. "Begorra, I hit him in the tail; faith, thin, I gave him a pill he won't stomach aisily," and other expressions passed his lips, and his one idea was that we should lower the canoe and at once give chase. Whether Flanigan's shot did perhaps graze the caudal extremity of one of these leviathans must forever remain undecided; but, be that as it may, it was the last we saw of them, and to this day F. firmly believes that he "bagged" a whale.

About twelve o'clock a breeze sprung up, and grew steadier and stronger, and as it struck the schooner, and the sails, which so long had flapped idly from side to side, first barely drew, and then gradually filling, caused the vessel to heel over, we experienced a feeling of relief it is difficult to describe. Before dusk we were bowling along at a rate of five or six knots, which, after our long inactivity, seemed marvellous, and we turned in for the night in the full expectation of finding ourselves next morning in sight of the West Point Lighthouse. The truth of the old saying, "*L'homme propose, mais Dieu dispose*" was again apparent, for in going on deck soon after daybreak I found that we were enveloped in a dense fog, while a thick drizzling rain had taken the place of the wind. It was ten o'clock before the mist began to lift, and a light air springing up an hour later, the tower of the lighthouse, which showed like a thin white line cutting the fog in twain, gladdened our eyes.

Under the now rapidly freshening breeze we soon closed with the land. The lighthouse stands on a low wooded

point. Close by is the cottage of the keeper, while what seemed to be a number of small fishing huts dotted the beach. The wind was blowing dead ashore, and a heavy surf, which made it no easy matter for boats to effect a landing, was rolling in, so the captain proposed running in for English Bay, a few miles to the northward. About half past three we found ourselves at anchor in a snug little bay, well sheltered by a projecting headland from the north, and, though apparently exposed to the full force of the south and southwest winds, so protected by a line of reefs which run three-quarters of a mile in a westerly direction that vessels may lie there in perfect safety in almost any kind of weather. The bay presented quite a busy scene; two schooners lay at anchor, while between us and the shore were some fifty large boats, some empty, while from others just returned from the day's fishing outside the fishermen were pitching the cod with large two-pronged forks into small flat-bottomed scows ready to go ashore. After paying \$25 for our passage we said "good-bye" to the packet, and as we neared the land our olfactory senses were assailed by a "horrible and fish-like odor," the cause of which we soon ascertained. Cod in every stage of the curing process lined the beach, some spread on long "flakes" of spruce and pine for drying, others already dried packed in stacks containing forty or fifty quintals apiece, whilst men and even women, with arms bared and with huge knives, were decapitating and cleaning those fish just landed from the boats. The smell from all these was by no means pleasant, but by far the choicest perfume ascended from large barrels of liver that lay decomposing in the sun. Were some of the advocates of cod liver oil to see the loathsome and stinking mass from which it is obtained we much fear the sight would forever cure them for any predilection for it.

While here it may not be uninteresting to briefly allude to the fishing carried on during the summer and autumn months. From a return made, embodied in the "Annual Report of the Marine and Fisheries Department" to the Dominion Parliament, it appears that during 1869 the yield and value of the fish taken is shown as follows:—830 cwt. cod, 830 cwt. ling, 450 barrels herring, 34 barrels halibut; value, \$8,160. The oil made during the same period was worth \$580. The most profitable fishing establishment is, however, at Fox Bay (the scene of the wreck of the ill-fated "Granicus"), on the northeast side of the island. Quoting from the same return we find that the yield was 1,375 cwt. cod, 1,375 cwt. ling, 1,000 barrels herring, and 65 barrels halibut; of oil we have 530 gallons cod, 530 gallons porpoise, and 250 gallons seal. This represents \$15,108. My visit was three years later, when the number of hands was very much greater. The men are principally inhabitants of Douglastown—fine stalwart fellows, who, by their ruddy cheeks, bear testimony to the healthy nature of their occupation.

As cod generally "strike" early along this coast they usually come over in May, returning to the main land towards the end of August, though two families, induced by the comfort they had experienced, and the profitable returns of the soil, spent the last winter in the bay, and do not seem to regret it. From its proximity to an open sea the winters are not so severe as those felt higher up the gulf, and we were repeatedly told by trappers and others, who from a long residence could speak with authority, that they found the cold greater at Quebec, and so far as actual temperature was concerned they infinitely preferred wintering in the island.

Dense woods of spruce and pine stretch down to meet the waters of the bay on every side, save where in the centre the jungle has been partially cleared away and given place to the log "cabins" of the fishermen. The soil from here to Ellis Bay, a distance of twelve miles, is light, in many places a stratum of gravelly limestone being found only a few inches beneath the surface. Several of the more enterprising families have, however, cleared small tracts of forest in the rear of their homes, and the neatly-fenced plots in which the potatoes were now nearly fit for digging augured well for the success of the little colony.

Having made a bargain with one of the fishermen to take our heavy baggage, in charge of Flanigan, round to the lighthouse, and sending the Indians with a few light traps in the canoe, we started on foot, accompanied for a short distance by a garrulous old man, who informed us that the island was the result of successive deposits of the sea, in proof of which he assured us there was the carcass of a whale far back in the woods. He was evidently rather Darwinian in his ideas, and no doubt could have still further enlightened us, had not we, being rather overpowered by the warm reception of the cod fish, which seemed to infuse itself into all around, bidden him a rather abrupt good night and proceeded on our way. From English Bay to West Point, two miles distant, we travelled along a good beach of stone and gravel, with reefs extending upwards of a mile from the shore, and beyond which the Indians were now paddling the canoe.

The coast is low, and covered with a small dwarf spruce, whose branches, gnarled and twisted by the rude blasts to which they are constantly exposed, are so thickly matted with the underlying growth, and conform so closely to the limestone rocks on which they stand, as at a short distance to resemble grass, and it is not too much to say that in many places it would be almost possible to walk on the tops of the trees, though such a statement may at first sight appear absurd. Near the lighthouse we came across the ribs of a large barque, which had been wrecked some two years ago; her cargo had been planks, which now lay stacked in square piles upon the shore, and which we had mistaken for huts on first approaching in the schooner. We were thus early greeted by a startling evidence of the death and danger which lurked around these shores, and, alas! it was not the first by many a one that was yet to stand forth as a grim and ghastly record, tending to confirm the wild and superstitious tales with which the island is invested. On our arrival at the lighthouse (a circular stone tower, faced with white fire brick, exhibiting a light 109 feet above sea level) we were met by M. Maulivin, the keeper, a stout, elderly French Canadian, who, however, spoke tolerable English, and seemed pleased to see us. He has a capital house attached to the lower basement of the tower, and a nice little farm, with two cows and a horse, besides pigs and poultry.

The mist which had been threatening all day now settled down into a dense fog, and the stillness of the evening was broken only by the report of the gun fired every three-quarters of an hour during thick weather. The canoe had not yet turned up, but the Indians were well able to take care of themselves, so we were not anxious on their account.

The next morning, as if to make amends for the inhospitable reception of yesterday, Nature wore her fairest garb. The plaintive moaning of the surf is lost in the gentle ripple of the water as it washes lazily upon the beach, and the sudden boom of the midnight gun, that seems to tell only of shipwreck and destruction, is succeeded by the musical tinkle of the cattle's bells as they stray through the woods. Along the shore flocks of plover and sandpiper are flitting, now wheeling far out to sea, now circling inward in rapid flight, alternately skimming the surface of the tranquil sea, which, mirror-like reflects their every motion, and rising in mid-air till the receding tide leaves some muddy patch, they slowly settle down, after a few minutes rest to be off again in quest of some fresh feeding ground. Outside the reefs a few fishing boats are already at anchor, while the dark brown sails of others hastening out to swell the number may be seen rounding the point. In the midst of this peaceful picture we are reminded of the far different aspect it too often wears, for close at our feet lies an old twenty-four pounder, red with the rust of upwards of a century. As the water falls more guns and a few round shot become exposed to view, and we learn that they once formed part of the armament of a large English frigate, lost here some time during the capture of Quebec. The crew escaped, and spent some months in the little bay we had just left, and which still preserves their memory under the French name of "Baie de Anglais."

It is worthy of remark that in many parts of the country there appears to be something in the pasturage which has an injurious effect upon certain forms of animal life. Rabbits and hares, without which scarcely an island of any size in the Gulf is found, are never seen, and though often introduced have quickly disappeared; rats which have escaped from wrecks speedily become extinct, and it is strange that, though the interior of the island abounds in lakes and ponds, the sources of numerous streams, the beaver, mink, and muskrat (the latter animal being so common elsewhere) are wholly unknown. The pleasant chirping of the graceful little chipmunk here never greets the ear, and there are but four fur-bearing animals known to the trappers—the black, or brown bear, the otter, marten, and fox, of which latter there are several varieties.

About eight o'clock the Indians turned up, having slept the previous night upon the beach. We started at three o'clock, the Indians taking the baggage in the canoe. We had intended to have camped this evening at Ellis Bay, but what with shooting at plover and yellow-legs, and not paying attention to the tide, now rapidly falling, the canoe had eventually to leave us and pursue her way outside the reefs nearly a mile off. The coast is low and thickly wooded, but it is not without its points of interest. Here a low, overhanging cliff of dark earth and limestone forms a headland, on rounding which we find the shore sweeping in gentle curves to where yon low wooded point marks at once the termination of one and the commencement of another bay; there a tiny stream, the outlet of some inland bog, after many a struggle to force its way over rocky crag and through

tangled jungle, at last emerges in a grassy hollow that skirts the forest, where forming a deep gully it issues forth in pure limpid water upon the gravelly beach.

When within two miles of Ellis Bay night overtook us, and as the evening was closing in with rain and wind we began to be anxious for the whereabouts of the canoe. We were just debating a halt when a faint shout broke on our ears. We fired twice in response, to indicate our position, and in about ten minutes we heard a splashing through the water, and presently Hamilton emerged like a water-god out of the gloom with the cheerful news that they could go no further, and that the boat and baggage now lay on the reef more than half a mile off. The rain was just commencing, so we had a pleasant prospect. There was nothing for it but to carry everything ashore as quickly as possible, and so first lighting a fire, there being luckily no lack of drift wood along the shore, we despatched H. back again. In less than an hour our traps were landed, the men working right well, it being no easy matter to carry five or six hundred weight of baggage half a mile through water and over stone and gravel in the dark. We now began to plan what shelter could be run up most readily for us to pass the night under; it was too late to cut down timber to construct a hut, so carrying the canoe out of reach of the morning tide we turned her bottom up, and then supporting one gun-wale on the paddles, the other resting on the shingle, we formed a tolerably dry covering for our heads and upper parts of our bodies. Plenty of boards were at hand, which, after drying by the fire, we laid along the length of the canoe. To pluck some of the birds we had shot and spit them over the burning embers was the work of a few minutes. They were delightfully fat and tender, and were hardly cooked before they disappeared before the hungry crowd that crouched around. After supper and a stiff glass of grog we put on our great coats, and rolling ourselves up in our waterproof rugs lay down; and so, with the rain beating pitilessly down upon our frail covering, the sea laving the beach, and a bright wood fire (in front of which the Indians were curled up in their blankets like two round balls) at our feet, we spent the first night on the island of Anticosti.

The next morning was fine, and as the tide was now high we lost no time in making a hasty toilet, and after a cup of tea and a mouthful of biscuit reloaded the canoe and set off at a brisk walk. A short half hour brought us to the bay, where we were favored with as fair a picture as one could well desire. Hardly a ripple stirred the bosom of the bay, which lay like one vast mirror, reflecting in its crystal depths the wooded shores and limestone cliffs which formed the setting. Here and there huge dark boulders rear their heads above the surface, their summits literally alive with seals basking in the sun, till, roused into activity by the sharp ping of a bullet that whistles close beside them, they flounder into the water with heavy splash, and the next moment are seen twenty or thirty yards off peering cautiously around in search of the intruder upon their wonted solitudes. Ducks, plover, and sea pigeons hover and circle over the outer portion of the bay, while from its inmost recesses flocks of ducks come soaring out in long succession, and yonder, flying in regular order like the letter V, a flock of wild geese sail majestically over the pine woods. From a little cove thin columns of blue smoke are curling upwards from the cottages of the few settlers who live here, surrounded by many a comfort denied to their brethren on the main land. The mouth of the bay is marked by two low wooded points, Cape Henry and Cape Eagle, or Pointe aux Pins, as it is locally named, the eastern headland being a distance of one and a half miles. A good channel three and a half fathoms deep, extending one and a half miles inland and three quarters of a mile in width, with good holding ground of clay, affords a safe anchorage for small vessels in any weather; the reefs which trend, one from Cape Henry in a southerly direction, a distance of one mile, and another from Pointe aux Pins, three-quarters of a mile westerly, forming a natural breakwater, which completely shelters the channel from the heavy surf which breaks on these bars with the slightest swell. The shores gradually rise in height from the entrance, and, doubtless from being more sheltered, the timber now first assumes respectable proportions; the jungle too disappears, and vast plains, or "barrens," as they they are technically termed, take its place. Far back into the country lie two elevated ridges or spurs, trending to the north and east, forming the watershed, whence spring the babbling streams and purling brooks which are met with at frequent intervals. Gentle coves with sandy beaches, backed by picturesque limestone cliffs, diversify the scenery, and the bay imperceptibly contracts, like the purse of a seine, till where, some two miles from the mouth, it receives a small sluggish stream, flowing through grassy bottoms, indented by projecting coves of spruce and pine. At the head of a neighboring inlet, known as Gamache's bay, from a worthy of that name, who was one of the first settlers, and of whom some ugly stories are told, stands the provision post, for the relief of shipwrecked mariners, and the comfortable looking cottage of Captain Setter, whose fine breed of cattle may be seen grazing on the marshy land we have just alluded to. At the entrance of the bay I got into the canoe and endeavored to "bag" a seal; they proved, however, too quick, diving simultaneously with the flash, and after several ineffectual "dodges" to try to get to windward, and so obtain a shot at the side of the head (where they could not see the flash), I gave it up, and, paddling ashore, lit a fire, and was soon deep in the mysteries of baking "chupatties" (an Indian cake made of flour and water, with a little butter to fry it in) and other culinary preparations for breakfast; of all

others the meal, *par excellence*, of the sportsman. De Courcey and Flanigan had meanwhile walked some way ahead, and now returned laden with plovers and beach birds, which proved a welcome addition to our larder. They had selected a better camping ground near the head of the bay, and accordingly about twelve o'clock we shifted our quarters to where the Indians had built us a very cozy looking bough "wigwam," prettily situated between the trees on the edge of the wood. On our way to the second camp we passed one of the limestone cliffs, of which mention has been made above, whose general effect was such as, at a short distance, to give one the idea of some moated wall, broken and crumbled by the hand of time. Almost opposite stood a larger cliff, but without any of the peculiar beauty of the one described. In the afternoon De Courcey went out shooting in the canoe, while Flanigan and myself followed the shore and struck into the woods near the head of the bay. After more than an hour's scramble through thickets of alder and dense woods of spruce and juniper, without seeing a sign of animal life, we came upon a small rivulet, which flowed in a dark inky stream from the "barrens" at the back of the bay, and, following its course, at last emerged upon the shore. The black flies swarmed in the woods, and though we wore green gauze veils our faces were literally streaming with blood.

De Courcey had met with poor success, shooting only three ducks and a few plover. The birds, he said, were very wild, and it was quite evident that they are much shot at by the settlers at Gamache Bay. It was a lovely night, and as we lay on our rugs after dinner, the moon shining softly down through the over-arching boughs, and the cry of the duck and shrill cackle of the wild geese feeding on the barrens was borne faintly on the still evening air, we began to realize the full enjoyment of a forest life. Tired with the long day of ceaseless activity we composed ourselves for rest at an early hour, little dreaming of the misery in store for us. About eleven o'clock it began to rain, and continued to pour incessantly all night. At first our covering of boughs and birch bark withstood the pelting onslaught, but presently drip, drip came the heavy drops. Turn how we would we could not escape them, and fitfully dozed and as fitfully woke up with a start.

The following morning after breakfast De Courcey and self started for a "barren" which lay close to the camp. A slight ascent brought us to the plain, which stretched inland some miles, surrounded (save on the side nearest the bay) by woods, which form picturesque capes and headlands in this vast sea. Pools and creeks of dark water, encircled by irregular sized patches of peaty bog, intersect the barren, which is covered with a thick green moss and lichen, and a species of plant in outward appearance closely resembling heather, while squash, pigeon, and other berries attain a large growth. At every step the foot sinks deep in the crisp, dry moss, and renders walking most laborious. From the feathers and numerous "droppings" these barrens are evidently the favorite resort of wild geese, which, with the rise of the tide come sweeping in from the reefs. Unfortunately it was now nearly low water, and they were singularly devoid of life, a solitary yellow-leg alone flitting over the pools. I mistook it for a jacksnipe and fired. The bird fell in the centre of a pool, and could only be approached by passing over some very treacherous looking ground. From a slight experience, however, of the bogs of the "ould country," I flattered myself I could get it, and springing lightly from patch to patch of grass hauled the bird forth and held it up in triumph. My troubles were not at an end, for on turning to retrace my steps my slight support gave way, and the next moment I went souse up to the waist. *Sic transit gloria mundi*. The situation was by no means pleasant, as I found myself settling down in the most disagreeable manner. Luckily De Courcey was at hand, and with his assistance and a deal of "tugging" I was extricated minus one boot, and with a coating of rich mud and clay deep enough to have grown potatoes in. I didn't bless that yellow-leg, but it was fortunate it was no worse, as our Indians told us afterwards that men have been lost in these bogs, so deep and tenacious are they in many places. In the afternoon we went out shooting in the canoe and bagged four ducks and one plover. The former are very wild, and it was with the greatest difficulty we got within range. This evening we turned in early, as we purposed crossing the bay at high tide at four o'clock A. M.

[To be Continued.]

Here is an account of a very ludicrous fishing match on the Nidd:

"**ANGLING MATCH IN THE NIDD.**—The third Walshford Bridge and Kuaresborough angling match took place on Monday last. The left bank of the river from Hardcastle's mill at Hunsingore and two miles beyond was staked out as the portion to fish, about twenty yards was allotted to each angler, and 173 competed. The day was excessively hot, but a slight wind caused a nice ripple on the water, which was slightly colored, but the fish captured were meagre in the extreme, many of the rodsters not even getting a nibble. This poor result from this river, and the many experienced anglers engaged, is surely a memorable event in the history of trial fishing. The trees adorning the bank of the river gave shelter to many of the rodsters, but the luckless who were cast for the open had to avail themselves of the slight protection afforded by umbrellas, &c., the heat being overpowering. The competitors were some dozen in number. All the skill of the anglers did not get a stone of fish amongst them. Just before the gun signalled "cease fishing," the fish were only beginning to bite, the power of the sun having decreased, one angler getting a prize with three fish caught, about twenty minutes before time was called." First prize £5; caught 1 lb 6½ oz

For the Forest and Stream.

FIRE FLIES.

At day's decline I come and see
In garden, hedge, and on the lea—
The flies in jolly repartee,
Light up their lamps so brightly.
O come, they say, and join our glee
And learn to skim as well as we,
Who took the very first degree
For being gay and sprightly.

Flies can not all be diamond flies,
(I don't know how we won that prize)
Though phosphorescent were our eyes,
And flame were our volition.
We could as well our light disguise,
As too a matinee emprise;
Who e'er by day our badge espies,
Scarce grants it recognition.

Though blest with reason, oft we see
That man ignores our self-taught plea,
That all his power applied should be
To some specific shining,
And not as though time did not flee,
His gift from bondage scorn to free,
Until he loose his own degree—
Defeating God's designing.

MARTHA EWING.

Trout Trails from the Nepigon.

TALE II.

CAMP CAMPBELL, Nepigon River, July, 1873.

EDITOR FOREST AND STREAM:

I date my letter from "Camp Campbell," twenty-eight miles up the Nepigon, above Red Rock Landing. What pleasant days we have passed here; what charming associations will always invest this delightful spot! Let us take in the unusual landscape.

Here is a bold, rocky point projecting into the river, upon which stands our canvas tent. It was covered with a thin growth of birch once, and three large evergreens found root and nourishment in the interstices of the rock-bed; but we have cut away all that is not needed for shade or ornament, and the open space affords us an unobstructed view of the river and its scenery above and below. Moreover, it permits a free draft of air, up and down stream, which most effectually clears the camp of flies and mosquitoes, and in midday affords a cool and refreshing relief from the heat. Even in this northern latitude the sun is sometimes oppressive at noon. Our bed is made of balsam boughs laid upon the flat bare rock, and covered with a rubber blanket, with woolen ones on top. By this arrangement we avoid the dampness of the earth, and escape the annoyance of the community of spiders, ants, bugs, wood-ticks, flies, worms, and other varieties of creeping and crawling things that infest the woods, and more especially of that infinitesimal and excruciating mite known in different localities as the sand-fly, gnat, punky, and midge, and termed by the Indians "bite-m-no-see-em." On the left we are flanked by a dense forest of hard wood and evergreens, threaded by paths which diverge from the camp, one following the bank to "Campbell's Falls," a few rods up stream, and another leading over the portage to the landing, a quarter of a mile beyond. This portage is necessary to surmount the falls, and over it all goods, canoes and stuff must be carried from the navigable waters below to those above. Across this and the several other portages on the river, the voyageurs of the Hudson Bay Company once hauled a fifty-ton schooner, laying skids for its passage.

In front of the camp are the cooking arrangements, and from the tent door the rocky knoll slopes gradually over green sward to the brink of a little land-locked bay, whose head is hidden by a high, round-topped, wooded promontory on the opposite shore. This bay is not more than a dozen rods wide, but it is thirty feet deep, and its waters are as green as those of the Niagara river. In the bight of the bay, out of sight around the promontory, a sheer precipice, five hundred feet high, and smooth as a wall, plunges perpendicularly into the water and is lost in the gloom of its own shadow. Directly opposite, on the other side of the bay, rises an equally high cliff of columnar trap, like the Palisades of the Hudson, with its base strewn with five-sided prisms and debris that have fallen from above. From cliff to cliff the slightest sound is thrown back and repeated in many an echo. Even the splash of the great lake trout, as he leaps from the waters that teem with fish-life, is heard with wonderful distinctness, whispered with a wierd and hollow sound. This columnar trap formation is one of the chief and grandest features of the Nepigon scenery, and occurs at frequent intervals along the river.

At our canoe landing we have spread an apron of alder-brush, to prevent the delicate craft from chafing its bottom upon the rocks. Half drawn from the water, its prow peers above the brink, and we look lovingly and tenderly upon it, for it is our only means of communication between the wilderness and the settlements miles away. And looking from our tent door out upon the enchanting view of the land-locked basin and wooded mountain ridges, noting the swirl left upon the calm water where a monster fish broke but now; watching the blue smoke curling from the camp-fire, and our little group of Indians in their fantastic attire, we cannot but bless the promptings of our inborn proclivities, which have taught us in this our after life to seek and enjoy these beautiful primitive spots of nature. But this is

only half of the picture. Let us turn riverward. If we open the rear fly of our tent, we have the broad expanse of the river before us, a river as broad as the Connecticut at Holyoke. A high ridge of undulating, forest-clad hills skirts its opposite bank. A wooded island divides it in the middle, and from shore to shore the waves are lashed into a tumult and commotion of white foam and leaping spray, that vies with the rapids of the Niagara, and dins with a never-ceasing roar. Right under and against the ledge upon whose very brink our tent stands, it dashes with sweeping turbulence, filling the air with delicious freshness and droning in continual monotonies of sound that almost drown the voice. At night it is a soothing lullaby that woos sweet slumbers, and gives restoring rest. A dozen rods above is a broken fall some ten feet high, hemmed in between the island and the rocky ledges of either shore. At the foot of these falls, where the water sets back from some jutting point, we can catch the monster speckled trout of this famous river; or, shooting across the seething rapids into the eddy below the island, we anchor the canoe in mid-stream, and with full sweep of casting room and unobstructed channel, hook and play our fish until a surfeit of pleasure makes the task laborious. These falls we have christened "Campbell's Falls," after the name of my *compagnon du voyage*, a Brooklyn gentleman who has explored the whole region, and taken up a claim of two miles square for mining purposes. These falls are included within his boundary lines. With the exception of "Rocky Portage," four miles below, it is the finest fishing point upon the Nepigon.

A rough-looking customer is this city friend of mine in his backwoods attire. I remember him as he stood at Red Rock landing awaiting the steamer which bore me to his chosen companionship, sun-browned to a hue as dark as the Indian's, unkempt, red-shirted, belted, and moccasined, with a flaring, knit woolen cap on his head, and a big knife thrust into a sheath ornamented with beads. A group of aborigines in motley, and a score of mahogany-hued surveyors stood near him on the wharf, and among them he was the "noblest Roman of all."

No ordinary event is the coming of the steamboat in these parts. Until last year it never came at all, and the primitive children of nature had never seen one. But now they are not only familiar with the big fire-canoe, but, alas, they know the way by heart to the bar on the lower deck, and many is the ominous whisper exchanged in the darkness of the passage-way near the shaft, and many a suspicious swelling of the arm as the noble red men hug their blankets to their breasts and quietly steal away to the gang-plank. To the arriving passenger the surrounding bustle, the rattle of trucks discharging freight, the process of wooding up, and the constant passage of figures moving, make the scene a lively one. The cabins are thronged with ladies in city attire, the saloon piano thrums, and there is the presence and familiar name of the steamer itself, so nearly associated with home and civilization. Up on shore are ranges of surveyors' tents, thirty or more, and wagons laden with their supplies are moving off to some distant points. All is activity for the nonce, and the place seems a stirring town. It is not until the steamer moves off down stream out of sight, and leaves one separated seventy-six miles from the nearest settlement, and hundreds of miles from the most accessible civilization, that he begins to realize the situation. And in the morning, when the surveyors' tents are struck, and they and their attendants, and the little group of Indians they hired for guides and boatmen, have silently moved away and left the place deserted, he for the first time feels the perfect solitude. Here is only a single inhabited house, with its adjoining store, warehouse and outbuildings; but another large and substantial frame house is in process of erection, and it is the musical clink of the carpenters' hammers that alone relieves the sudden and almost painful stillness, and makes him feel the pleasure of companionship.

Nevertheless a warm heart beats under the frieze over-shirt of the Company's agent, our good friend Robert Crawford, and when he has squeezed your hand in his till the bones crack, and towed you up to the little log house, and made you welcome with a bottle of Bass, you forget your momentary nostalgia, and are prepared to select your outfit for the woods. An important functionary is this same factor; for under the Canadian regulations, he dispenses the necessary permits, without which no angler can fish in the Nepigon.

Plentiful are the stores of pork, flour and tea that are set apart for the voyage, and to these are added such luxuries as individuals may prefer to take—pickles, sugar, condensed milk and coffee, canned fruits, soups and vegetables, dessicated meats, hard biscuit, ham, bread, ale, whiskey, molasses, salt, pepper, soda powders, &c. Where the absence in camp is to be a long one and much of the distance is to be traversed by water, it is wise to provide one's self with all obtainable luxuries. But in all other cases the knowing ones will travel as light as possible, stinting themselves with a meagre bill of fare, and depending upon rod, gun, and snares to keep their larder full. A real curiosity shop is Crawford's store, filled from floor to ceiling with an assortment of goods so endless that it would puzzle a tradesman to pick out his own. "If there is anything you want and don't see, ask for it." As the blood of the Indian is here diffused and commingled with that of the white man, in every shade of degree and proportion, so the habits and styles of dress are combined and assimilated, the French Canadian or Scotchman donning the moccasins, beadwork and fancy toggery of the Indian, and the latter arraying himself in some portion of the habiliments of the white man. I have seen, but in only one rare exception, an Indian

dandy go so far as to assume kid gloves and neatly fitting calf-skin boots, but I doubt if the temporary gratification of his vanity compensated for the excruciating pain of cramped up toes and abraded shin-bones. Wherefore it is that in Crawford's store we find suspended a singular assortment of moccasins, shoe-packs, boots, and a curious variety of hybrids, so to speak, which combine the qualities of all. The like foot-covering of tanned and untanned leather, canvas and woollen cloth, it would be impossible to find elsewhere. Then there is the heavy Hudson Bay coats with their monstrous hoods to protect the head in winter; the beautifully knit and parti-colored sashes, two fathoms long, which are almost invariably worn here in lieu of a leather belt to support the trousers or leggings; tobacco pouches and knife-sheaths, ornamented with beads; snow shoes; baby-cradles that don't rock, but which are simply a flat board to which is fastened a pocket highly ornamented with quill work and beads, to put the baby in; toys, nap kin-rings and table-mats of birch bark and sweet-scented grasses interwoven; beautifully stained mats made of water-rushes; queer knit woolen caps, scarlet and blue; and so on to the end of the catalogue which supplements the trade-list of patent-medicines, clocks, pickles, sleeve-buttons, cough-drops, calicoes, tooth-picks, note paper, jack-knives, baking powders, shot guns, and umbrellas, which are sent out from England and Canada.

Perhaps the most interesting curiosity here is the new house which Crawford is building. The winters here are bitter cold, and when the mercury sinks to minus forty, water will freeze, in an ordinary house, between two red-hot Canadian stoves set six feet apart. To secure the requisite warmth for comfort, Crawford is trying to make his house frost-proof. It is a very creditable two-story-and-a-half frame building, forty feet long, with a kitchen and dining room extension. Upon both the inner and outer sides of the joists are laid inch boards, tongued and grooved. Then upon the outside of these is laid a thickness of tough cedar bark; upon this a layer of two-inch planks, and out side of all a coating of clapboards. The inside is furred, lathed and plastered. In this domicile of ten thicknesses the tough old factor of the Hudson's Bay post hopes to keep warm next winter by the aid of his huge two-deck stoves. The cost of this house would startle even a New York contractor, for there are no saw mills here, and lumber and materials have to be brought from Collingwood, eight hundred miles away. The garden fence itself cost a dollar a foot. By the way, Crawford's "gude wife" has succeeded in raising vegetables that it would be supposed would hardly grow in this climate.

Dear me, how I do run on! This letter is already exceeding the limits of your patience, and the columns of your paper. I will call my Indians, get my stuff into the canoe and paddle up stream to camp No. 1. We will imagine tents struck at "Camp Campbell," and ourselves just starting for the voyage, which I would rejoice if it were so that I might live over again those delightful experiences in fact as well as in memory. The camp is only half mile or so up stream, just where the river rushes in turbulent discharge and magnificent breadth from a rapid or fall above. It stands on a grassy plateau surrounded by a hardwood thicket of birch and maple, interspersed with spruce. From the tent door we can see far down the river—the landing, Red Rock and the Islands below. In front the tide rushes by like a mill-race; but a little jutting point above us makes an eddy, and in the still water our canoe rests quietly, the main body of water sweeping down with immense volume until it impinges upon a sand bluff one hundred feet high. Here it spreads out into a vast pool of great depth, and now with scarcely perceptible current glides smoothly on its way. From the bluff down to Crawford's is a half mile stretch that would be prized in the States as a course for a regatta. Opposite the camp is a low, flat island. There are two wigwams on the point. These are occupied by the families of two of the Indians who are to take us up stream. Their canoes are just visible protruding from the alders that skirt the shore. Up the bank nets and clothes are drying. One squaw with a pappoose lashed to her back, is bending over the camp-fire preparing supper. The evening shadows, thrown from the high bluff opposite, are lengthening. The clouds in the west are red. Trout are breaking in mid-channel. A scolding kingfisher is balancing himself on a naked limb that overhangs the bank, keeping a sharp eye to business. The whole is a picture that needs no setting. It is simply enchanting.

Now, while our *factotum*, John Watt, who is both cook and pilot of our expedition, is putting up the tent and cutting wood we will shove off the canoe and catch a few trout for supper. We can catch trout anywhere about here. If you will only toss your fly into the head of the channel that cuts off the island opposite you will strike a four-pounder. Down at the landing there is seventeen feet of water, and just where the tide sweeps past the end of the pier, you can hook them every time. I can see Crawford there now, with my field-glass. Oh, the toiling, sweltering, friends at home! What would you give for one hour of this probation?

"John."

"Sir?"

"In the morning we will walk across to the head of the rapids, and try the fish there at sunrise. Go down to Crawford's and tell him you want his ox wagon to haul the canoe and stuff across the portage, at daylight—remember."

"I will, sir."

"Now, John, get your coals red hot; we will bring you a couple of trout in a jiffy. Shove off the canoe."

HAVELOCK.

HOW TO CATCH A SALMON.

THE following sketch is from the able pen of Wm. H. Venning Esq., Inspector of Fisheries for the Provinces of New Brunswick and Nova Scotia, a gentleman in whose genial companionship we have rejoiced, by editorial desk and dashing stream. [Ed. F. & S.]

"At earliest dawn one morning in July, Fred, Charles, Harry and Jim woke from sound sleep on fragrant couches of fresh fir boughs, in their comfortable camp at Burnt Hill on the Miramichi, and after a refreshing plunge in the clear, cool water, proceeded, according to a programme arranged the evening before, Fred and Jim to the "upper casts," where the ice-cold waters of Burnt Hill Brook flow over a succession of small ledges into the main river, Charles and Harry to the "Pool," and the rapids of "Grassy Island," both within five minutes walk of the camp.

Morning had raised the mantle of darkness, and the ruddy glow of the Eastern horizon told our fishermen they had no time to lose, as their hopes of freshly caught salmon for breakfast depended on their skill in luring the monarch from his haunts amid the rocks which, at these points, break the quiet flow of the river into mimic waves and circling eddies. Let us accompany them, gentle reader, and see how salmon are conquered by doughty knights of the rod and skillful squires of the gaff.

Immediately in front of the camp, about twenty yards from the bank, is a flat-topped rock, that rises just above the level of the river, affording good footing and a splendid cast up, down and across the pool. Here we will leave Harry, who has waded to the rock, and is deftly casting a fly far down the quiet pool, and walk with Charles about forty rods further down the bank of the river, where Grassy Island divides the stream, and where the still waters of the pool rush swiftly through a narrow gorge on the hither side, broken into numberless eddies as it strikes the rocks thickly scattered below the island. A ledge, partially submerged, here extends from the shore to the very edge of the foaming current, enabling the sure-footed angler to approach so near that he can cast his fly well across the channel that separates him from the island, and also down to the nearest rocks at its foot. Here our friend Charles has betaken himself, and, with skilful hand, is making his fly dance in the eddy of "salmon rock." The sun has peeped above the horizon and given him an encouraging wink; he is using his best skill, causing his fly to fall with the lightness of the natural insect, allowing it to rest a moment, then making it flutter on the surface, and finally lifting it for a fresh cast. Apparently the wily fish is choice in his food this morning, for he gives no evidence of his presence, and a less experienced fisherman than our friend would hastily conclude that he was "not at home" for the day. Charles knows better; so, having offered his Highness one dish without exciting even curiosity, he is now intent on substituting another of less gaudy hue and more modest proportions.

While he is changing flies, let us just take our lungs full of this invigorating air, every inhalation of which is a positive pleasure, and look on the magnificent panorama before us, as length after length is unrolled in the gorgeous light of the rising sun. Is it not a sight to gladden the heart of the poor dweller in cities, who has almost forgotten when he last saw the sun rise? But look! Charles has caught either the monarch or his rock, for the arch of his rod tells its own tale. Ha! see there! a fifteen-pounder, at least! Again and again, the splendid fish throws himself full length out of water in the vain effort to snap the thread of fate. Foiled, by the dexterous management of our angler, in his cunning attempts to throw himself across the slender line that held him, he made directly for the rapids, and a most exciting combat ensued.

To the left, shorewards from the rock on which the angler stood, was a small, quiet basin, sheltered from the rush of water by the ledge, to the right; the water rushed with the velocity of a mill-race, broken into foam by sunken rocks and projecting points of the ledge. In this basin, could he only succeed in restraining his captive, there was ample room to "play his fish," and every probability of ultimately securing him; but if he once got his nose into the rapid, no tackle could hold him, for the strength of the current was such that it required an effort to draw even the line up it; he would have the game all his own way, would run off from fifty to eighty yards of line, and most probably tangle or cut it round one of the numerous rocks at the foot of the rapid. As the whole energies of the fish were directed to getting into the current, the whole strength of rod and line, and all the skill and judgment of our angler were in requisition to keep him out of it. For some moments it was a tie—the persistent efforts of the prisoner were met by a stern determination to try rod and line to the utmost verge of prudence, and the two forces were so evenly balanced, that, for more than a minute, the fish did not gain an inch. Becoming convinced that his position was a dangerous one, desperation added strength to the prisoner, and slowly, foot by foot, he neared the rapids of hope to him, but of grief to his captor. With thumb on line, anxiously calculating the last ounce it would bear, and with the but of his rod directed to the fish, reluctantly our angler yielded inch after inch to his retreating prey. With disappointment and dismay we see him gradually approach the edge of the current, and give up all hope of breakfasting off him. Not so our friend Charles; he had been victor in many more desperate straits, and now, cool and calculating in his judgment, while every nerve was tense with delicious excitement, he stood clamly weighing the chances, equal to either fortune, success or failure. He knew that

if he increased his pressure on the line by another half ounce, one of two results was sure to follow, either the hook would be torn from the fish's mouth, or some part of the tackle would be broken; in either case, good bye monarch; but, by judiciously yielding, there was still a chance of final success; so his eagle eye and steady, skillful hand were both on the alert, ready for what the exigencies of the case might demand. The fish had now fairly won his way within three feet of the rapid, and most fishermen would have relinquished the last hope of turning him, but your true angler never gives away a trick. Our friend Charles, gauging to a hair the strength of his tackle, kept on the pressure to the extreme point of safety, but in spite of coolness, skill, judgment and determination, he had met his match; while resisting to the utmost the prisoner's efforts to escape, he admired his strength, endurance and persistent pluck, and smiled

"With the stern joy that warriors feel
In foemen worthy of their steel."

Inch by inch the noble fish fought his way—inch by inch the reluctant line slipped through the rings, the arch of the rod unbroken, and the but following the fish—until at length he gained the rapid; with one wild plunge, and a triumphant wave of his broad tail, down he went! The short arch of the rod was instantly relieved, the line, left free, uncoiled from the whizzing reel, and ran through the rings like lightning, making that most exciting of all music, that none but an angler can appreciate. Down, down the rapid he shot like an arrow, until he reached the water below, when the weight of some fifty or sixty yards of line that he was towing, began to diminish his headlong career. Charles, still apparently cool and collected, but with the fire of intense excitement in his eye, had now his skill tried to the utmost, while our chance of breakfasting off that fish looked slim indeed.

There must have been at least fifty yards of line run off in that splendid rush, and the monarch was now in his familiar haunts, amid visible and invisible rocks, scattered thickly around. To exercise much control over him at that distance was impossible, and it became absolutely necessary to his capture, to turn his head up the stream, and so prevent him winding among the dangerous rocks, and perhaps cutting the line against their sharp angles and rugged edges. While the salmon is running from you on a long line, no control can be had over his movements, he goes where he pleases, and does as he chooses, but when heading toward you a skilful hand can guide him where he will. Hence our angler now directed his attention to turning his fish, and reducing the distance that separated them. So, with hand again on line, and "butting" him well, he bore with steady strain on the flying prisoner, held now by the slightest of bonds. Finding his progress impeded, and his strength impaired, the preplexed fish again throws himself out of the water in desperate efforts to break away. Cool, self-possessed and wary, the angler foils these cunning tricks, by depressing the tip of his rod, which takes off the strain, the moment the fish leaves the water, and elevating it again, which replaces the strain, the instant he touches it in his fall. Unsuccessful in his efforts, and still feeling the strain of the mysterious thread, the courageous fish rushes madly up stream, putting the skill and quickness of our friend to the severest test, for if the prisoner can only succeed in getting this inexorable strain off the line, he will probably dislodge the tempting sham that lured him to his fate. Elevating his rod, he winds in his line with a speed and steadiness that practice alone can give, and the startled fish, although going in the opposite direction, still feels the exasperating thread, that is now drawing him forward with as much force as it before drew him back. Utterly mystified, and unwilling to approach the spot from which he had so recently and by such hard labor escaped, he goes to the bottom to rest and consider matters.

Fishermen generally call this "sulking," but our angler knows that the noble fish never *sulks*, never despairs, he merely takes a breathing spell, and is cogitating all the while, studying his next defensive movement, and aware that this will take the form of a succession of short, sharp jerks, to tear out the fatal lure—just as a brave man undergoes the pain of wrenching out the barbed arrow, knowing that present anguish is the price of future safety—our friend Charles takes this opportunity of getting to shore. With cautious step, for the ledge is slippery and the footing treacherous, with one eye on the last visible inch of his line and the other everywhere—"feeling his fish" all the while, carefully letting out line as he recedes from the fish, and reeling it in as he approaches him, so that the same gentle strain shall never cease for an instant, he picks his way rapidly to shore, daring many a dangerous leap with the *foot of faith*. Once safe on shore, he breathes more freely, and feels increasing confidence as to the result, he walks steadily down past the rapid, taking in line and feeling his fish, till he reaches the nearest point in a direct line to his resting captive. The imminent danger of defeat being now over, our angler is quite as willing as his prisoner to rest awhile and wipe the perspiration from his brow.

Our monarch had evidently a knotty problem to solve, and was doubtless meditating deeply on "the position"; were it not for the regular and symmetrical arch of the tapering rod, we should not have known his whereabouts. Presently there came a succession of sharp, indignant jerks, then a relapse into quietness. Had these jerks been met by a straight rod, thus bringing the whole force on the hook, instead of on a yielding arch that gave to the slightest strain, the chances were ten to one that the captive's object would have been gained, and the hook torn from its hold;

but our angler had learned from experience that the monarch of the stream is most to be guarded against when most quiet, and was fully prepared to foil this manoeuvre. Accordingly the jerks were met by a long and flexible arch, which offered so little resistance, that the efforts of the fish could only fatigue himself, and render his subsequent struggles less vigorous. Still, these vindictive jerks are not relished by the angler, he knows they mean mischief, and that they are liable at any moment to succeed—for who can tell how a salmon is hooked till he is fairly on shore? So, to avoid a repetition of these dangerous tricks, and to prevent him from recovering energy to repeat them, it became advisable to rouse him from his lair, keep him in motion, and exhaust his strength as soon as possible; for your old angler well knows that the chances of losing a fish increase in a direct ratio to the square of the time he has been on the hook, as every rush, and every struggle, and the consequent strain on the hook, is weakening the integuments in which it is embedded, and wearing out the hold. Our friend knew all this, and felt himself master of the situation. Avoiding that two common practice of attempting to rouse his fish by jerking on the line, thus doing, much more effectually, what the fish has been trying to do, he shortened the arch of his rod by pointing the but in the direction of the fish, thus increasing the steady pull on his prisoner, and causing him to set every muscle to resist the merciless strain; then drawing the hunting-knife from its sheath at his side, he gave a succession of smart raps upon the but of the rod, sending an electrical thrill down the tense line, so surprising and startling that, despite his courage and pluck, he fled amain, in a series of short, irregular, zigzag plunges, and once more headed down stream.

Constant exertion and the incessant strain had evidently reduced his strength, and his career was now soon checked by a judicious use of the but; in addition to the weight of line he had to draw through the water, the shortened arch of the rod made it more difficult to uncoil the line from the reel, and he soon gave evidence of fatigue. Unable to continue his course, he came to a halt, still resisting to the utmost the strain applied to turn him, and in the struggle to maintain his place we could see the glitter of his silver side—sure omen of success to the cautious angler. To a steady, careful, persistent, yet gentle strain, he was forced to "give up the position," slowly but surely the revolving reel shortened the distance between him and his relentless foe. The victory now seemed to us to be won, again our mouths watered at the idea of our delicious breakfast, and we became impatient to see the full length of this brave but conquered hero. Not so Charles. Past experience had taught him that in angling, more than in any other pursuit, there was "many slip 'twix cup and lip," and that a salmon, especially, was never vanquished while he could wave his tail, more powerful in his death throes than in life. Carefully, but cautiously, he wound in the line, his eyes never leaving his approaching prize; gradually the distance diminished, the brave fish coming in sideways, until he was within ten yards of the shore. Our trusty canoe-man, George, was ready, gaff in hand, and only waited a nod from Charles to wade into the water and end the battle. The feeble struggles of the exhausted monarch told that the favorable moment was approaching, and the weary waving of his restless tail was the only indication that the brave old warrior was still alive. The expected nod was given, and George cautiously approached the apparently exhausted captive. Waiting till Charles, by dexterous management, had brought the broad side of the fish directly in front of him, with gaff outstretched, ready to give the final *coup*, he made one step forward, but in his eagerness, placed his foot upon the round surface of a slippery stone, lost his balance, and in the instinctive movement to recover it, brought the gaff down with a splash within a foot of the quiet and unresisting fish. Quick as thought the apparently subdued prisoner darted up stream, making the rod bend and the reel fairly sing with the rapidity of its revolutions. With one glance of indignation at poor, crest-fallen George, our angler, who had never relaxed his care, even in the moment of assured victory, let the fish have his head, knowing that the strength of the current and the weight of the line would soon overcome this last effort of the courageous monarch. The result proved the correctness of his augury. Nobly the gallant fish held his way till at the very foot of the narrow channel near which he was hooked; he had now taken off the reel about thirty yards of line, and to draw this after him in the swift water of the rapid was too much for his exhausted strength. Poising himself a moment on the brink, he made an attempt to shoot the rapid, but being met by the opposing skill of his wary foe, who at this moment shortened the arch of his rod to its quickest curve, by pointing the but directly at him, he fell back, and was carried down by the current. When again brought to the surface, it was evident that fish nature could continue the combat no longer, and fairly exhausted by his last futile efforts to escape his fate, he turned his silver side to the sky and was quickly drawn in to the spot he had so lately left. Our friend Harry, who had watched the battle without a word, but with every feature eloquent with excitement, now seized the gaff, determined that no less worthy hand than his own should give the finishing stroke to this brave warrior. Wading within reach of the nearly lifeless fish, with sure and dexterous stroke he impaled him on the gaff, and walked ashore with the corpse of the gamest fish that ever gladdened angler's hearts or rewarded skill and coolness."

A large number of very fine green turtles have just arrived at this port.

Woodland, Lawn and Garden.

HEDGES AND THEIR USES.

No. II.—THE NORWAY SPRUCE.

"The hedge was thick as is a castle wall,
So that who list without to stand or go,
Though he would all the day pry to and fro,
He could not see if there were any wight
Within or no."—CHAUSER.

In our first paper upon hedges—their growth, culture and adaptedness to the wants of the husbandman, the landscape gardener and others—we placed the arbor vitæ at the head of all our evergreens. This favorite and truly beautiful plant stands justly at the head of all our hedge plants, and will always be in requisition for the purposes of strength, beauty and durability, and as the plant for hedges *par excellence*.

Now it is one of the necessities of the well-tilled field that the precious grains therein enclosed should be securely protected from all foes from without—should be securely hedged.

"There was a certain householder which planted a vineyard, and hedged it round about." Here we have the old authoritative voice of antiquity for our favorite hedges, and we readily find the use and application of "green materials" was a pastime well known even in the days of Homer. You will at once recur to the familiar allusion to hedge-making, known to Laertes on his return from the wars and the enquiry "where is the old king, my father; why greets he not his son?" He found him in his garden breaking up the ground preparatory to planting a hedge, while his servants had gone to the adjacent woods.

"To search the woods for sets of flowery thorn,
Their orchard bounds to strengthen and adorn."

—Pope's *Odessey*.

For a beautiful, durable and impenetrable evergreen hedge we place next to the arbor vitæ the Norway spruce. This magnificent tree, the pride of the arborescent gardener, developing itself in stately grandeur when standing alone or in groups upon our lawns, when planted out in small plants, in symmetrical rows, makes one of our very best hedges extant. For the enclosing of parks or grounds where a tall shelter from the prevailing winds from any given point is desirable, this tree seems admirably adapted by Providence for just this use. The Norway spruce will thrive quite well upon almost any ordinary soil, and even in the most gravelly will send up a straight, firmly compacted cone of beauty.*

A few years since, we well recollect, there was quite a hue and cry made as to the utter impossibility of raising evergreen hedges. Many persons, some of them passing for very sensible men, wrote foolish articles, and made still more foolish speeches, on the "Hedge Question." Time has since proved the fallacy of their predictions. Facts have for years been arrayed against these fancies of long ago, and the skillful landscape gardener now points the skeptic of 1850 to a long half mile of majestic Norway spruce hedge, in all its greenness and compactness, truly beautiful to behold, as the once "poor little despised scraggle" they saw in the original seedlings of eighteen inches.† In this case *seeing* has become believing that some things can be done as well as others.

The true value of the Norway spruce cannot easily be overrated when we ask ourselves the practical question, "What do we want such a hedge for?" "Why it is a standard tree, one whose trunk when well developed is a tower of itself, and it flings its huge arms abroad like a young giant?" Truly such is the fact; yet this giant of the forest, this paladin of the lawn, becomes your *servant*, and holds beneath its sheltering arms all the various gifts of pomona. The hedges of Norway spruce in some parts of Massachusetts are used for enclosures, or "break-lands," familiarly called, for the protection of choice pear, peach and fine fruits.

I can cite many cases with which I am familiar where, previous to the planting of hedges of this kind, but few pear trees of our choicest kinds could be grown, and those all inclined in the direction that the prevailing or strongest winds blew.‡ Some trees never overcome this fixed habit; others can by judicious treatment be brought back again to something like their primitive form.

Every close observer of the most simple laws of nature will have observed that in many regions of our country low currents of cold air in winter are very prevalent, and if they push their inquiries still further they will find this cold element of air always proves very destructive to the stems not only of many species of plants, but especially is it destructive to the stem and twigs of the pear.§

Now, friend, if you would remedy in a measure these effects enclose your orchards with such protection as you

*I have seen some of the most gigantic specimens of this tree jutting out from the crevices of almost perpendicular precipices, showing both life and beauty.

†This hedge is growing within one mile of the residence of "Olipod Quill," and can be seen by any one desirous of witnessing one of the most beautiful hedge rows of Norway spruce in Massachusetts.

‡The best remedy for these effects are found rather in hedging your orchard first and setting your pear trees afterwards. This explanation seems necessary in this place, though really belonging to the department of agriculture.

§I have seen a curious and very peculiar result of the intense coldness of this undercurrent of cold air acting upon unprotected trees. The compression of air in their cells becomes so great by sudden and very severe cold as to produce a sort of explosion, much like that caused by application of fire to gunpowder.

find readily at hand; protect your trees by a good substantial hedge. The lower branches of the trees are those which need the sheltering arms of the firmly-set hedge-row. The higher branches remain uninjured when the lower ones suffer badly. Remember that there is no better protection than a belt of fine, large evergreens for your orchard trees, especially the tenderest kinds.

Such a hedge as I have been describing can be had in nearly every State in the Union under good or ordinary circumstances, and we do not hesitate to say, from a most careful observation, that evergreens, belts and hedges of trees are worth at least ten times the cost of producing the same.

The time for planting out the Norway spruce for hedges we have found to be as soon as possible after the 5th of April to the 15th of June for all States north of Virginia. They can be made to live even later if they are well set, yet they are very jealous of kind treatment. The next best time we recommend to be from the 1st of September to the 5th of November. In all our Northern States the Norway spruce, like the arbor vitæ, stands the severest climate. Even in the years of 1860 and '61—winters of extreme cold—the evergreen trees of our New England States remained uninjured, while those of Great Britain—many of them—were very badly killed.

The Norway spruce hedge, when once permanently established, grows to maturity quite rapidly. The plants should be procured from the nursery—to be of good form, and in height about one foot to eighteen inches. Plants suitable for making a good hedge will probably cost from \$12 to \$16 per hundred, or even less. They should be set from three to five feet apart for a large sized hedge, and may be kept well pruned, as they bear the knife as well as the arbor vitæ. Care is required in starting out a new hedge; they will not need pruning the first year after setting out. Upon setting the same dig a trench two feet wide and two deep, filling in about one foot or little more with good garden mould, preserving the roots unbroken when set out. At setting a slight watering may be given to the roots previous to covering in the soil, which is to be firmly pressed about the roots and leveled. Now mulch with almost any stubble—seaweed, salt, hay, sedge, &c. Keep out the weeds for two or three years, and you will have just such a hedge as will always delight your eye and gladden your heart. The second year this hedge will be ready to give its first *side cutting*, or pruning, the thickness of the hedge to be governed by the inclination of the proprietor, but *not less* than two feet from the bottom are the side shoots to be pruned, and some even claim a width of three feet.

OLIPOD QUILL.

News From Abroad.

England, in a sporting way, has just recovered from the effects of the Goodwood races. This important event may however be represented in the light of a vigorous yawn, prior to a long sleep, for after it comes London's dull time. To-day clubs are mostly abandoned, and unfortunate members wander listlessly through deserted rooms. Even cavalry officers have tethered up their spry little game ponies, somewhat run down by excessive polo playing. But still there is the lively movement of those preparing for the shooting season, and guns are furbished, and dogs are unleashed, and visions of grouse, partridges, plover, and woodcock are in the distance. Opinions are still somewhat divided as to the quantity and quality of the game birds, and fears are entertained that they may not be as plentiful as last season.—In reviewing the athletic sports for the year, strange to say, a leading authority complains of the *overpetting* given by the higher classes to such contests in England, (we only wish we could have some of it here), stating that one of the consequences of this overfondling, has been "that it has checked a useful critical temper and disposition," in regard to such pastimes. If only, we repeat, some little of the over-gushing, what the French call *le trop plein*, would come this way, how it would be appreciated.—Some very little quiet growling is indulged by the papers in relation to the cock-fighting, not as much at the measures used how to prevent it, but because the individual who has been prominent in efforts for its suppression, Mr. Peter Taylor, has been opposed to the flogging of garroters. It is what John Bull calls unreflecting humanitarianism.—All yachting matters are lively, and the general fleet ready for its two months cruising.—On the continent, now that Baden and Hamburg have become strictly moral, vigorous attempts, in the way of pigeon shooting, steeple chases, and running races are to be inaugurated at the watering places, all as incentives for the traveling British, who seem more than any other people on earth, to miss their *rouge et noir*.

—To show how cricket is appreciated we copy the following from the *Field*:

YORKSHIRE V. GLOUCESTERSHIRE.—Another Yorkshire Chieftain has made an appeal to the public, after a long and honorable career. For nearly twenty years the name of Rowbotham has been intimately associated with Yorkshire cricket. The match chosen for the benefit was the one above named, and reports say that on no previous occasion have so many people congregated at Brammallane, the scene of action. On Monday 11,080 paid for admission; and, as upwards of 4000 tickets were sold, the attendance could not have been far short of 13,000. The spectators also mustered strongly on the two succeeding days, and the weather was favorable throughout.

—Mr. Fred. R. Lane, in his yacht Linda, has reached Australia, having been only thirty-five days in sailing from Port Natal, East Africa, a distance of 4000 miles. The

yacht left England on the 4th of June. It was the intention of this spirited yachtman to cross the Pacific, making San Francisco his next port. Two members of the cruising club, are doing the Rhine in their canoes.

On the 10th of this month, an interesting pigeon race took place, which we take from the *Field*.

This morning I had the pleasure of liberating at the London Bridge station eight pigeons belonging to the members of the Folkestone Club. These birds competed for a valuable silver cup. They were liberated together in the Belgian manner, and, rising well into the air, they flew straight away in the right direction without a turn. The blue cock belonging to Messrs. Medhurst and Hooper, and the blue hen belonging to Mr. Sutton, flew a dead heat, the time, including that required for capturing and showing the birds, being seventy-five minutes; the exact distance sixty-three miles.

Respecting the use of the cormorant, an adoption from the Chinese methods of fishing, we copy as follows:

In a letter lately received from my good friend M. Pichot, is the following interesting bit of news relating to cormorant fishing: "I have had this morning a very interesting letter from Mr. De la Rue, the forest inspector, who keeps our birds. He has been down to Chatellerault to fish a pond so much crowded with weeds, that it was impossible to take any fish there, either by line or by net. So the master of the place, Mr. Trenille, one of our good masters of hounds, laid a wager of £25 with some friends that he would take fish there with Mr. De la Rue's cormorants, and accordingly De la Rue went down there last week, and won the wager most splendidly. But he tells me of a very interesting episode. His two cormorants are in full flight, and while standing at the foot of the Castle of Chitree, whose ruins stand over the valley of the Vienne, which river runs at about one mile's distance, the cormorants espied the water in the valley, and one of them, named 'Red,' immediately took to his wings, and flew towards the river. All the assistants believed the cormorant lost, but De la Rue calling out loudly to his bird, and waving his glove as a 'lure,' called him back instantly, and the cormorant, after having described a wide circle round the ruins, alighted at the feet of his master. This is the first time I have heard of a cormorant being flown like a hawk." I have for many years used trained cormorants for fishing, but never experienced a similar thing.—F. H. SALVIN.

The coaching rage has run over to Ireland. From the *Land and Water* we cut the following:

"Not content with a Four-in-Hand Club in its chief town, Dublin, Roscommon has determined to make its mark, and actually turned out no less than three coaches on the last fair day, and thus made it memorable. Two more were expected, but were stopped by the ills of horseflesh. The special reporter of the district describes the scene in the following graphic manner:—'The crowd which lined the streets was so vast that barely a narrow lane was left for the teams to pass through, and the cheering was so tremendous that only steady horses and steady coachmen could have done the journey without accident.'"

DOES RACING ENCOURAGE GAMBLING?

THIS tendency of racing to encourage gambling and to promote the breed of blacklegs is a serious and growing objection, the most serious perhaps of all objections, to the sports of the Turf. But race-horses are not dice of necessity; and there is no necessary connection between horse-racing and gambling, because a bet is the touchstone of an Englishman's sincerity, and as long as this is the case it is as hopeless to attempt to put down gambling by suppressing races as it would be to talk of arresting the sun by stopping our chronometers. It cannot be done. Parliament might interdict horse-racing to-morrow, and make it a penal offence to book a bet upon a race for a pair of gloves or a white hat. But gambling would still be carried on; and it is an open question even now whether more money does not change hands on the Stock Exchange in the course of a single fortnight in what are really and truly gambling transactions than changes hands at Tattersall's, and on the race course of England, in a year. It is a foible of Englishmen, and all we can do is to make the best of it. Tattersall's is not the only spot within the four seas where gambling is carried on. It penetrates the whole of our social and commercial life. It is the life and soul of much of our trade. The ironmasters of Staffordshire gamble in iron-warrants. The brokers and bankers of Liverpool gamble in cotton-bales. The Manchester men gamble in grey shirtings. The merchants and brokers of Mark Lane gamble in corn. The shipowners of the Tyne and the north-eastern ports gamble with their cargoes and crews. It is, in fact, hard to find anything in which some of us are not gambling more or less all through the year, from molasses to madollapans. The sports of the Turf are in-themselves a healthy, manly, invigorating pastime; and the pastime, with steeplechasing, hunting, boat-racing, and the rest of our sports, has helped to make the national character what it is. An Englishman loves a horse as much as an Arab does. It is an instinct with us all. It is in the blood. You cannot eradicate it; and perhaps on the whole, it is hardly desirable to attempt to eradicate it; for people must have sport of some sort, and if they cannot have healthy and exhilarating sports, like those at Epsom and Newmarket, they will take to something worse. Horse-racing is at least a humaner sport than bull-fighting. It is healthier than the cards and dice of the Italian and French casinos. It is pleasanter than the beer-bibbing customs of the Germans. The Turf has, and must have, its follies and its vices, like everything else; and when a race-horse is turned into dice on four legs, the sports of the Turf take a form which true sportsmen themselves must reprobate as well as the best of us. But to say, as one of the severest of our satirists has said, that although the horse in itself is one of the noblest animals, it is the only animal which develops in its companion the worst traits of our nature, is to do an injustice to the horse as well as to its rider; and if the observation were true, it would apply quite as much to the highest and noblest of our race as it does to the troop of blacklegs who are to be found on every race-course.—*Gentlemen's Magazine*.

—In 1870 there were in England 977,707 horses, in 1872, 962,548, a decrease of 15,159. Ireland has about one third less horses than England.

Natural History.

THE PRODUCTION OF HYBRID FISH.—We observe that experimental attempts are now being made by some pisciculturists to produce a hybrid, or more properly, a cross between the salmon and brook trout. It is quite probable that such a mixture may form a desirable addition to our already varied stock of native fishes, partaking perhaps of the fine edible qualities of both the migratory and the lacustrine species. Mr. Wilmot, the celebrated Canadian fish-culturist, produced at his works at New Castle, Ontario, as long ago as 1868, a most successful result by impregnating the eggs of a female salmon-trout with the milt of a male grilse. (The grilse, although not a fully matured salmon, possesses the powers of fecundation.) The cross thus obtained is of the most promising kind. They may not propagate, but if they can be artificially bred in sufficient numbers, the improvement is a material one, and the addition to our supply of fish food quite important. We have the testimony of Prof. Von Seibold and Dr. Gunther for the superiority as table food of barren fishes of the salmon family. Their flavor is excellent, and their flesh more easily cured than that of the true *Salmonidæ*.

That fish do interbreed in a natural state and without artificial inducement, is abundantly proved by the fact that a friend of the writer, (a thorough and venerable angler,) took a trout four years ago at the outlet of the Piseco lake, Adirondacks, which was marked in every respect like an ordinary brook trout, but had the distinctive forked tail of the "laker," or indigenous salmon trout. It was six inches long. Now the lakera are never found at the outlet, and are seldom taken weighing much less than a pound, certainly not of the diminutive size of six inches long; while the brook trout are found in the lakes. This could not have been a young laker, for it had the spots, marks and fins of the brook trout. It seems to be an authentic case of hybridity.

The Trepang, or Beche de Mer, a favorite food of the Chinese is found in quantity in the islands of New Caledonia. The fishing for this curious creature is in the hands of a few individuals. The *trepang* varies in length between a few inches and a yard; is like a fat, ugly worm, two or three inches thick, with hardly any interior arrangements. Its capture is an easy matter in Bualabio, in fine weather, and the best quality is sold in Noumea, on the mainland, for £80 per ton. But in China the price is more than double, for in the China seas the *trepang* fishing is a matter of skill, patience, and courage. In the months of October and November, the Malays equip thousands of junks for the gathering of these hideous zoophytes on the treacherous coasts, where they have to dive or to drag at great depths in order to get at their prey.

It is at Ouen, in the Australasian group of islands, that the huge shells called by the French *benities* (baptismal fonts) are found, specimens of which may be often seen in gardens in the United States. It is difficult to procure a perfect specimen, because the larger valve is always deeply imbedded in the corals, with which in the long run it becomes incorporated. The inhabitant of this huge shell usually keeps the upper valve open, feeding on everything that the waters bear to him; but occasionally, either at the approach of danger, or that he may seize his prey, he clashes the two valves so violently one against the other that the noise may be heard from afar, and is like that of a heavy stone flung upon a hard rock. It is not pleasant to contemplate the result of putting one's foot by accident into the toothed apertures which lie hidden so harmlessly among the corals.

Prof. Agassiz's establishment at Penikese Island may be considered a "primary school" compared with the Baird's University at Peak's Island, in Portland harbor, Maine, for to the latter place are flocking the most eminent professors of natural history in the country, and the scientific operations are of the most elaborate character. The United States government has placed a revenue cutter and a tug at Prof. Baird's disposal, and you can imagine what good use he will make of them. A large house has been fitted up on the island for a laboratory, with every convenience for preserving, assorting and describing the specimens collected. Photographs are taken, drawings made and colored from the living objects.

The director of Central Park menagerie reports as follows the number of animals on April 1st, of the last three years.

	1871.	1872.	1873.
Quadrupeds.....	89	102	199
Birds.....	143	208	347
Reptiles.....	14	11	35
Births during the last year: 2 lions, 1 leopard, 2 pumas, 1 camel and 1 hyena, the last-named animal being (as is supposed) the first of the species born in the United States.			

THE HUEMUL.—The Earl of Derby received a specimen of this animal from Port Famine, in the Straits of Magellan, described and figured in the Proc. Zool. Soc. 1849, p. 64, t. XII., as *cervus leucotis*, and now in the Derby Museum at Liverpool. Mr. Bates has sent to the British Museum a male and female of the Huemul, which were obtained by Don Enrique Simpson in a valley of the Cordilleras, lat. 46° S. These have been described, the horns of the male figured, and the history of the animal given in detail under the name of *Huamela leucotis*.

The animal, like all the American deer, differs from the stags of the Old World in having no tarsal gland.

Bualabio, one of the most beautiful of the islands of New Caledonia, is entirely forsaken by the natives on account of the mosquitoes.

Fish Culture.

MR. Henry Tagg, of "Ingham Springs," sends us a description of his trout and salmon farm near New Hope, Bucks county, Pennsylvania. It was commenced in the summer of 1870, and affords another illustration of the fact that the propagation of fish is an established industry, and if carried on with reasonable intelligence and care, will pay largely on the investment. He writes:

"The spring, which is one of the largest in the State, and admirably situated for the purpose of fish culture, having no other waters or streams near it to affect its purity, or cause its inundation, flows from under a large walnut tree, through a depression or ravine in the land made by the wash of the water, at the rate of eighty barrels per minute, with a temperature winter or summer, of fifty degrees. To contract the flow of water a dam nine feet high has been thrown across the ravine, giving a good fall to the hatching house and ponds to which it is conducted by terra cotta pipes six and twelve inches in diameter.

The hatching house is built of stone fifty-five feet long, thirty-five wide and seventeen to gable-peak. Into this house is conducted six inches of water emptying into a filtering box, and thence along a trough the entire length of the building; this trough being tapped at intervals, supplies other troughs nine feet long, twenty-eight inches wide divided in the center along their length, making a pair each thirteen and a half inches in the clear, in which the spawn is placed. These troughs empty into others set below them of same length, thirty-three inches wide, called nurseries, into which the fry are placed after hatching to remain until sufficiently strong to be placed in the primary ponds thirty-four feet long, four feet wide immediately outside of the house and through which the water from the nurseries passes. The fish are kept in these ponds until late fall, growing in size under careful feeding from three to five inches in length. They are then placed in ponds sixty by ten feet, and three feet deep, to remain until the ensuing fall, again to be changed into ponds one hundred by fifteen feet in size, and five feet deep. These ponds have attached to them spawning races forty feet long by four feet wide, supplied with water direct from the spring, which passes over gravel placed on coarse wire screens. The fish under the influence of the propagating instinct swim up these races and deposit their eggs on the gravel, which, falling through the wire screens, lodge on other finer screens placed directly under, thus enabling the spawn to be collected without handling or disturbing the fish. The eggs are then carried to the hatching house and placed in the first mentioned troughs to hatch. This process is accomplished in about fifty days. The water is well filtered before passing over the eggs, so that any fibre or dirt may not come in contact with them. A steady pure stream is made to pass over them until hatched.

The fish when hatched have attached to them a sack which it brings into the world out of its parent egg. This sack supports them for some forty days, when they are fed on blood until sufficiently strong to eat finely chopped meat, which is increased in coarseness as they grow older and larger. The per centage of eggs hatched under ordinary care is over ninety, and of those that arrive at maturity is not less than seventy-five, while in the wild state the percentage is five and two.

A distinctive feature of this farm is the raising of salmon. It has been held by pisciculturists that migratory fish would not live without being able to return to salt water. The experiment was started in April, 1871, when 4000 eggs were purchased of S. Wilmot, Newcastle, Canada. The result of the hatching was ninety-two per centage, and the fish are now eight and twelve inches in length, and remarkably healthy. The Messrs. Thompson & Tagg are so sanguine of success in acclimating the salmon to fresh water, that they are building a breast for a lake to cover some twelve acres with water, and having in some portions a depth of twenty-two feet, which they intend stocking with salmon and trout. They will this fall experiment in making a hybrid of the salmon and trout, which if they succeed will give a new variety of food fish well adapted to stocking fresh waters. The stock of fish now in the various ponds embraces all the various sizes from three inches in length, to twenty inches, and number many thousands. The different sizes are kept separated as much as possible, as the large devour the small. They are regularly fed on offal meat procured from the large meat-packers, the cost of which is the handling and freight. The fish can be disposed of in any amount in New York markets at seventy-five cents to one dollar per pound. The supply has never yet been equal to the demand. The ova of the salmon and trout, after fecundation, and when the embryo has become sufficiently developed to stand handling, can be carried (packed in damp moss) by express long distances with reasonable expectation of success in hatching.

—Mr. Buckland seems to cast some doubts as to the old story of the surfeit of salmon on the part of apprentices and servants in former times. He seems to think that their nicety of stomach arose from the fact that the servants were fed on fish which were either dead or dying, then salted and dried, and that they rebelled against this diet.

—At lake Lucerne, good trout can be caught, but according to the account of a recent English fisherman, the large fish were only to be had when fished for at night.

—The sturgeon of the Caspian Sea, attains the enormous weight of 2500 pounds, the roe weighing alone 800 pounds.

The Kennel.

THERE seems to have arisen quite a scare in the neighborhood of Newtown, Long Island, from what is stated to be the attacks of wild dogs. Some years ago a number of Siberian bloodhounds were brought into the country by a German family, and those animals not having been cared for, took to the woods, and are said to have lapsed into the ferocity of wild animals. In the vicinity of Jamaica they have attacked many persons. A hunting party is to be organized who will make an attempt to exterminate the pack.

Grace Greenwood can talk "dog," and do it charmingly. She is in Kansas, at Fort Hays, and though she writes some little about the officers, devotes no end of attention to the many dogs. See how nicely she describes "Hod," a hunting dog: "He is the gentle playmate, the humble slave of the beloved children of the household, but in society rather blunt and blundering, lacking in delicate tact. It is best not to be too familiar with him as his friendship is a little overpowering. He imagines that you cannot have too much spotted pointer. He leaps up on you and crushes your frills, and licks right and left, and collides with you in door-ways, and backs up against you, and sits down on you, and thrashes you with his tail." Now a lady who can stand this kind of rough fondling and not abuse the dog, is not only the paragon of her sex, but a *canophilist* to boot, which is about the highest praise we can give her.

The Ettrick Shepherd pleasantly tells us the of dogs that used to accompany their masters to church, in the pastoral district in which he lived—how they lay quiet and patient during the whole service, till the last psalm was sung, and the minister and congregation stood up for the blessing, when their delight at the prospect of immediate emancipation could no longer be restrained, but expressed itself by joyous barking. Often have we witnessed such a scene, although we never heard a minister advise the people, as Hogg relates, to 'sit still and cheat the dogs.' Nor do we think they could be easily deceived in such a matter. In the pastoral districts of Scotland, the number of dogs present during divine service, always very much attracts the notice of strangers. Many shepherds come to church attended by more than one. It is often almost unavoidable for them to do so, because at certain seasons of the year they must go to the hill and visit their flocks in the morning; and, if possible, they arrange so as to make part of this inspection on the way to church, leaving to the last that part of the morning's work which may be thus accomplished. It is not always, however, on account of that the dogs are brought. The shepherd likes to be always accompanied by his dog, and the dog likes to be with his master. By frequently attending his master to church, he acquires a habit not easily to be relinquished. He seems to regard going to church as a privilege.

MAD DOG BITES.—The recent cases of hydrophobia in this city, says the *Baltimore American*, have excited discussion concerning the nature and origin of this mysterious disease which may contribute something of substantial value to medical science. We find that a large number of intelligent writers are of the opinion that cases of true hydrophobia are exceedingly rare, and those distressing symptoms which affect patients who have been bitten by dogs supposed to be rabid are due in a large measure to the influence of the imagination upon the nervous system. There was a death in this city some time since which would seem to confirm this latter hypothesis. A robust man of middle age was bitten by a dog, which may or may not have been rabid. He professed at first to have no fears, but secretly he brooded over the bite and read everything concerning hydrophobia that he could find in medical books and encyclopedias. To drown his apprehensions, he drank intoxicating liquors to excess. Seven weeks after being bitten he was taken ill. He died on the seventh day after the convulsions appeared. The child that was bitten by the same dog the same time did not go mad, and has continued in perfect health to this day.

There was another case of hydrophobia, however, in South Baltimore some two or three years ago, in which the imagination could have had no possible influence. A little boy about seven years of age was bitten. The little boy paid no attention to the bite, it soon healed up, and the circumstance was forgotten both by him and his mother. Eight months thereafter he was taken with a spasm; a physician was summoned, who found that the cicatrix of the old bite was inflamed, and that a mark extended from the wound to the elbow. The child died in five days; all the symptoms of hydrophobia were present, and a number of physicians who saw the case were satisfied no other known disease could have produced them.

This case seems to establish the theory that the poison, when communicated by the tooth of a rabid dog, is held, as it were, in a little vesicle or sac which forms about the wound, and that it is not absorbed until this receptacle is destroyed by the assimilating processes of nature. If taken up by the blood immediately, hydrophobia would result immediately. The fact that the wound becomes sore just before madness comes on shows that some disintegrating process in the cellular structure must be taking place. Great faith should be put in the cutting out and cauterizing of the wound, for there can be no doubt but that the poison remains there a long time before it is absorbed.

—There are three kinds of hawks used in Persia. The kind called the *cherkh*, a strong and handsome bird, is used to chase the antelope. The dogs and bird are slipped simultaneously, and hunt in unison. The hawk attacks the antelope, striking at his head and eyes, so crippling it that it falls an easy victim to the hounds, which could not otherwise approach it. Does are principally picked out for sport, as the birds may be hurt by the antlers of the buck antelope.

—Dogs are used in France to retrieve the lost balls at the *Jeu de mail* the old game of pall-mall. As they are wooden balls the dogs cannot hurt them.

The Magazines.

AT TATTERSALL'S.

AT Tattersall's! What romance—what mysteries—what iniquities cluster round these words—"At Tattersall's!"—in the imagination of millions of men and women! It is the Mecca of the Turf, and it is to sportsmen all over the world what the House of Commons is to politicians—what the Stock Exchange is to men of business—what Printing House Square is to newspaper men—what Paternoster Row is to publishers—what Westminster Hall is to lawyers—what Westminster Abbey is to English Churchmen. It is a classic spot, a spot over which the imagination of sportsmen broods, like the imagination of a devotee over the associations of a favorite shrine. Originally, Tattersall's was a mere stable yard and horse repository, distinguished from the general run of establishments of this kind only by the larger attendance of sportsmen. The Subscription Room is comparatively the creation of yesterday; and there must be scores of men yet on the Turf—men who have been ruined by their speculations on two-year olds, and men who, beginning as stable-boys, now keep their banking accounts with a standing balance of £10,000—who, when they first consulted "Old Tattersall" about joining the Room or making a book, were bluntly told to keep their money in their pockets; for it is an odd illustration of the caprice of circumstances that the founder of the yard, the man under whose management the Corner attained its highest prestige and became the exchange of Turf-men, had what many of his friends thought an insane horror of a betting book, and did all that a man in his position could do to check gambling by friendly hints and suggestions to youths fresh from college and fired with the idea of making a splendid *coup* at the expense of the Ring.

Fourteen years have now elapsed since Old Tattersall, after a reign of fifty years, handed over his hammer to younger if not more vigorous hands, and in those fourteen years the science of betting has grown and developed more than it had probably done in the previous half-century. What Old Tattersall would have said if called upon, as his descendants have been, to knock down a two-year old with £2,500 of forfeits on his head, I cannot say; but that fact sufficiently illustrates the daring and adventurous spirit of speculation which marks the Turf-men who now meet under the shadow of his rostrum to stake an estate on the throw of a "dice on four legs." Tattersall's yard has grown with the growth of horse-racing; and it now forms the central institution of the Turf, is the focus of half the gambling that is carried on within the four seas, gives the cue to every bookmaker, regulates by its quotations the odds on every race-course, and through the system of agency that has sprung up within the past few years is open to every clerk or draper's assistant or stable-boy who wishes to stake half-a-sovereign. In the course of a couple of hours in the afternoon one hundred thousand pounds have been known to be invested on five or six horses. This, in fact, is now a regular branch of commission business, and the account of what was done at Tattersall's yesterday appears in all the newspapers as regularly as the City Article and Court Circular.—*Gentlemen's Magazine*.

SPORTING ENGLISH STATESMEN.

THIS breed of English statesmen began with the Lord Treasurer Godolphin, and till to-day we were beginning to think that it ended with Lord Palmerston, all the men of political mark on the books of Tattersall's breaking up their studs and relinquishing the Turf within a year or two after the disappearance of "Old Pam." The last of these sporting Secretaries of State was General Peel, and General Peel has now left the Turf as well as the House of Commons for five or six years; and, with the exception of Lord Hartington, the front ranks of neither the Conservative nor the Ministerial Benches in the House of Commons now contain a single face which is familiar to the Ring. Mr. Disraeli is perhaps a sportsman at heart, and the best description of the Derby that has ever been written—the classical and historical description—is that from his pen. But Mr. Disraeli is only a sportsman as most of the rest of us are sportsmen, in his love of sport, of horses, and of the genial and healthy excitement of the Turf. And Mr. Gladstone is not even this. If the Premier can distinguish a race-horse from a hunter, or a hunter from a cob, it is all that he can do; and what the Premier is, the rest of the Ministry are and must be, I take it, now, if they are to play their parts well in Parliament and in the work of administration at Whitehall. The Marquis of Hartington may perhaps be able to spare time from the work of governing Ireland to look after a stud of horses at Newmarket, and to make a book upon the Derby, or the St. Ledger; but if the experience of Lord Derby, Lord Palmerston, or even of Lord George Bentinck, is worth anything, the man who enters into politics as a science—enters into it, that is, heart and soul—must think of no books but blue books, and of no horses but his hunters and his park cob.—*Gentlemen's Magazine*.

DUBLIN IN THE LAST CENTURY.

PADDY'S pet accident in those days was to fall into the Liffey. One might almost suppose that he looked upon this picturesque but evil smelling river as the Hindoo looks on the sacred Ganges, and believed that everlasting happiness was to be procured by immolating himself in its waters. Does a trooper or a dragoon go down to the river to water his horse? He falls in and is drowned. Does a merchant go to the quay to see a brig unloaded? Does a sailor go down to Ringsend in a boat? Does a girl take some clothes to the riverside to wash? "Drowned! Drowned!" Shakespeare's exclamation was never so applicable. And if anybody falls in, an impetuous but unreflecting bystander generally jumps in after him or her, apparently forgetting that he himself is not much of a swimmer, and both are, as a matter of course, drowned forthwith. In one case a good natured gentleman, seeing a girl lamenting that the tide had carried away some sheets she was washing, goes in after them, but having over estimated his powers of natation the man goes the way of the clothes, and is lost forever. Another gentleman's hat is blown off (no light matter in the days of gold laced head coverings), in he goes after it into the fatal waters, and soon exchanges Liffey for Styx. Persons of "disordered minds" (of whom there would seem to be quite a little army going about), are very fond of trying to cool their heated brains in these "waters of Eblana." But the vast majority of these deaths from drowning are

dismissed with the contemptuous pleonasm that the deceased was "intoxicated with liquor" at the time. By the way, there is a powerful aroma of whisky about this period in the annals of the Green Isle. Two successive viceroys, my Lords Northington and Rutland, are freely spoken of as notorious sots; indeed, Rutland is well known to have drunk himself to death while still a comparatively young man. And so on, down through every class. Lord Northington gives a fancy ball at the Castle. He being very unpopular at the time, the people, with rare temperance, refuse to drink the barrels of ale set running for them by the lord lieutenant, which are left to the soldiers, so that the whole guard, horse and foot, were, as "our own correspondent" curtly observes, "when we left, helplessly drunk." A favorite mode of shuffling off this mortal coil is to drink an enormous quantity (sometimes specified as pints, five half pints, &c.) of spirits, the not unnatural consequence of which is very speedy death.

If the above sketch should appear exaggerated, I am prepared to assert that among the innumerable papers I have looked over there is a death by drowning, a murder and a fatal accident for every day in the year.—*All the Year Round*.

FAMOUS BRITISH REGIMENTS.

THERE is an old military tradition that the Fifth won from the French the feathers which they now wear, and that they dyed their tops red by dipping them in the blood of their enemies. The true story, however, is this. The "Old Bold Fifth" had the distinction of wearing a white plume in the cap, when the similar ornament in the other regiments of the service was a red and white tuft. This honorable distinction was given to them for their conduct at Morne Fortune, in the island of St. Lucia, where they took from the French grenadiers white feathers in sufficient numbers to equip every man in the regiment. This distinction was subsequently confirmed by authority, and continued as a distinctive decoration until 1829, when a general order caused the white feather to be worn by the whole army. By a letter from Sir H. Taylor, adjutant general, dated July, 1829, the commander-in-chief, referring to the newly issued order, by which the special distinction was lost to the regiment, states that, "As an equivalent, the Fifth shall in future wear a feather half red and half white, the red uppermost, instead of the plain white feather worn by the rest of the army, as a peculiar mark of honor." In 1774 they went to put down the so-called rebellion in America. They fired the first shot of the unfortunate war at Lexington, where they came on some armed American militiamen, and were nearly surrounded at Concord, where they had destroyed some military stores collected there by the so-called rebels. In the attack on Bunker's Hill, near Boston, the Fifth had hot work for a June day. With three days' provisions on their back, cartouch box, &c., weighing one hundred and twenty-five pounds, they toiled through grass reaching to their knees, between walls and fences, in the face of a hot fire, and eventually got possession of the enemy's works on the hill near Charlestown. The Fifth also joined in the reduction of Long Island, the battle of White Plains, the capture of Fort Mifflin, the reduction of New Jersey and a fight at Germantown, where they rescued the Fortieth regiment from an American brigade.—*All the Year Round*.

HOW THE CONTINENTALS STOPPED THE PLAY.

PERHAPS no regiment in the British service has had its deeds better recorded than the Fifty-second—probably no regiment has won more glory. "A regiment never surpassed in arms since arms were first borne by men," Napier said of it, after the gallant fight at Nivelle. The sentence rings in one's ears like the bugle sounding "the advance," and that it is fully justified the emblazoned words on the regimental colors of the Fifty-second (Hindoostan, Vimiera, Busaco, Fuentes d'Onoro, Ciudad Rodrigo, Badajoz, Salamanca, Vittoria, Nivelle, Orthes, Toulouse, Waterloo and Delhi) pretty amply prove. The regiment first distinguished itself in the American war for independence, 1775. While investing Boston an odd event occurred, which is thus described by Lieutenant Martin Hunter in his amusing regimental journal:

"During the Winter," he says, "plays were acted at Boston twice a week by the officers and some ladies. A farce, called the 'Blockade of Boston,' written by General Burgoyne, was acted. The enemy knew the night it was to be performed, and made an attack on the mill at Charlestown at the very hour the farce began; they fired some shots, and surprised and carried off a sergeant's guard. We immediately turned out and manned the works, and a shot being fired by one of our advanced sentries, firing commenced at the redoubt, and could not be stopped for some time. An orderly sergeant, standing outside the playhouse door, who heard the firing, immediately running into the playhouse, got upon the stage, crying out, 'Turn out! turn out! They're hard at it, hammer and tongs!' The whole audience, supposing the sergeant was acting a part in the farce, loudly applauded, and there was such a noise he could not for some time make himself heard. When the applause was over he again cried out, 'What the devil are ye all about? If ye won't believe me, be Jabbers, you need only go to the door, and then ye'll hear and see both.' If the enemy intended to stop the farce they certainly succeeded, as the officers immediately left the playhouse and joined their regiments."

The Fifty-second fought at the battles of Brooklyn and White Plains, the reduction of Fort Mifflin, the taking of Rhode Island and the battle of Brandywine. In 1777 they helped to surprise a force of fifteen hundred Americans under General Wayne in a wood, when three hundred of the enemy were bayoneted at their bivouacs.

The Fifty-second lost four captains in the American war; and on the death of Captain Powell in New Jersey, the drummer of his company was heard to exclaim: "Well, I wonder who they'll get to accept our grenadier company now; I'll be hung if I would take it."—*All the Year Round*.

With regard to the new Mauser rifle, a German paper says:—"It cannot be questioned that we have a weapon excellent in all respects; in mode of construction, solidity of mechanism, tension of trajectory, security for the marksman, rapidity of fire, lightness of weight, certainty of discharge, and general convenience in handling."

Answers To Correspondents.

ANDREW H.—The best mixture for preserving the skins of animals is one in the proportion of six pounds of alum, and three of salt. Dissolve both in about a gallon of warm water. Use when cool. Place skins not too tightly packed, in a barrel or keg, and pour in mixture. Skins without injury to hair may be kept any length of time in this way, and all in good order at any time to stuff. Best handy book we know of for this kind of lore, is Edwin Ward's Knapsack Manual.

VICTOR S. P. The question of *drift*, depends on the character of the rifle and nature of twist, so that no positive data can be given. At a distance of 1,200 yards, its maximum is about eighteen feet. Your experiments would be of great interest.

T. U., JR.—Body's performance in walking is stated to have been one mile in six minutes forty-two seconds, and Westhall's one-half mile in three minutes ten seconds. We can find you an amateur who can walk at any time, his mile in seven minutes, fifteen seconds.

L. S. G.—"Nepigon" is correct orthography. It is so spelt on Admiralty charts and Government maps. The Indians spell it Nipigo, and pronounce it Neepigo, with a French "e" sound.

S. H. B.—We should be glad to have a specimen of the fish for examination, and think we can class it. Pack it in rough dry salt.

OLD HAND.—From the description you give, we think you are in error. The turkey is found in Honduras, and its name is the *Meleagris ocellata*. Its plumage is more brilliant than that of our wild turkey, and its size smaller. Anything you may write about that section will be interesting.

A. B.—An Englishman and his game-keeper will hunt with six dogs, and sometimes in the afternoon, supplement it with a fourth couple, having also a retriever.

J. O. B.—We know of a St. Bernard dog, here in New York, bought of the Monks at the Hospice for 800 francs. He cost, we think, pretty nearly \$300, when landed. The animal is good natured but not sociable.

HORACE.—The sisters of the Irish setters you speak of, undoubtedly the best dogs of this kind, were sold for eighty guineas. The dog man you mention is not reliable, we are sorry to say. It is always risky work importing a dog. Will place you in communication with the person, you inquire about.

H. V. & Co.—The tin can of preserved fish is excellent, quite as good as any imported. As an alimentary substance it would be a success. We take great pleasure in fostering any enterprise of this character. See our first number.

INGRATIS.—We have never heard of the grayling (*Thymallus signifer*) being caught south of Michigan. Send accurate drawing, and if possible the fish itself in rough salt.

RABBY.—We have found a box of tar ointment, carried with us invaluable for dogs' feet, especially in chicken shooting. Wash first the dogs feet in lukewarm water, adding a little salt to it. If he shows a decided tenderness, stop hunting him for two or three days.

S. O., Utica.—We think you have taken the name of the gun maker in vain. Their reputation is excellent, and the work they turn out admirable. We used the same make of gun last year, and please gracious, if answering all the questions put to us, does not prevent it, will use it again this fall.

—A Mr. E. de Borssiere, has some 3000 acres of land in Kansas, which he intends to devote to silk worm culture.

—A Virginia lady, gathering berries, was lately struck twice in the breast by a rattlesnake, but thanks to toilet artifices escaped harm.

—Colonel Noah Orr, of Marysville, Ohio, aged twenty-seven, seven feet eleven inches high, measures seventy inches around the chest, and brings down the scales at 670 pounds.

—At last they have a copyright law in Turkey, and we congratulate the literary world on the fact. There are so many people who have had their works pirated in Turkey. Now they will have a chance for readers.

French sugar makers get one pound of sugar from sixty-six pounds of beets, while in Louisiana from the infinitely richer cane, about one pound of sugar from every forty-five pounds of cane is about the average.

—A school of large whales, some of them seventy feet long, were off Saybrook last week; very few humps or fin-backs among them. The appearance of so many large whales together is a novelty.

—The trotting stallion Sentinel was found dead in the stable at Ash Grove Farm, Lexington, Ky., last week. His owner, Edwin Thorne, of New York, recently refused £30,000 for him.

—"Uncle" John Bullock of Bristol is only 104 years old. Uncle John endured a severe attack of pneumonia in June, and when he was convalescent he called his boys about him and remarked: "That was a severe attack. If I'd been an old man, I guess it would 'have fetched me.'"

—Wolves in immense numbers have appeared for the first time for many years among the settlements near the Strait of Belle Isle on the Labrador coast, and entirely broken up one settlement. On the night of July 1st they attacked a party, killing and devouring three men and one woman.

—Two amusing answers of the son of a Western Senator at West Point are recorded. On being asked into how many pieces a discharged spherical shot will burst, he replied, "Into two, at least, sir, I should think," and on being asked what were the uses of the vent in a piece of ordnance, replied, after mature consideration, that "it showed the upper side of the gun, and it was useful to spike it with."

"HAIRY TERRAPIN FROM CHINA.—In the 'Travels of a Pioneer of Commerce in Pigtails and Petticoats,' by T. T. Cooper (London, Murray, 1871), there is a plate of one of these hairy tortoises from the lakes of Ha-su, above Hankow. These curious little animals were about two inches long, and covered on the back with a long confervoid growth resembling green hair. The tortoise being a sacred emblem in China, the Chinese make pets of the hairy tortoise, which they keep in basins of water during the summer months and bury in sand during the winter. A small lake in the province of Kiang-su is famous for these so-called hairy tortoises, and many persons earn a livelihood by the sale of these curious little pets. The figure in Mr. Cooper's book looks like an oval door-mat, with a tortoise's head sticking out of one end."

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, AUG. 21, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

Calendar of Events for the Current Week.

AUGUST 21st.—The Manhattan Cricket Club vs. Walthams, at Waltham, Mass.

AUGUST 22nd.—Bostons vs. Walthams, at Waltham, (Cricket).—New York Yacht Squadron at Newport.—Extra meeting at Monmouth Park, Long Branch.—The Park Association, Wilkesbarre, Penn.

AUGUST 23rd.—Meeting of the Athletic club foot of 133rd street, East river.—Extra meeting at Monmouth Park, Long Branch.

AUGUST 26th.—Earl Park Association, Earlville, Ill.

AUGUST 27th.—Herdie Park Association, Williamsport, Penn.—Earl Park Association Earlville, Ill.—Middletown Association, N. Y.

AUGUST 28th.—Earl Park Association.—John Biglin and George Brown sculler's race, Halifax Harbor, N. S.—Middletown Association, N. Y.—Herdie Park, Williamsport, Penn.

CREEDMORE.

IF by any method it could be possible to get at this fact, as to how many men in the United States of American birth, outside of military organizations, were or were not proficient in the use of arms, we feel certain that the proportion familiar with the shot gun or rifle would be found in the majority. Taking Prussia, with her all-absorbing military element, as a comparison, we think that it would not be unsafe to assert that in a squad of ten Germans, on their first introduction to the routine of arms, nine-tenths of them, when the gun was placed in their hands for the first time, would be utterly ignorant of its use. This is that exact distinction, sometimes overlooked even by military authorities, between men "able to bear arms" and men knowing how to use them.

How long this general acquaintance with the use of fire-arms in the United States would have lasted is, however, a question much more difficult to answer. From our own experience, notwithstanding the late terrible appeal to arms, we are inclined to think that this familiarity would have gone on decreasing. The reasons for our thinking so are quite plain. The first school of arms with us would never have been acquired in the camp, but as heretofore would have been obtained by the use of the shot gun and rifle in hunting. As day by day our country is getting more thickly settled and game scarcer, these opportunities, once indulged in by all classes, would have become more rare. We even think that already this change is somewhat noticeable. In our younger days, even in the large cities, every youth of sixteen almost, had his fowling piece—to-day it is getting exceptionable. Other occupations, tendencies towards a sedentary life, disparity of fortune, less time for recreation, with the scarceness of game, have all caused this change.

Though Englishmen were our superiors in athletic sports they certainly were not our equals in the general use of fire-arms, for the very reason that in England game was not so abundant, the hunting ground was limited, and even the right to use arms was placed under certain restrictions.

It is exactly for this reason—the possible decline in the knowledge of how to use fire-arms—that we hail with pleasure the introduction of rifle shooting, and the most laudable efforts to give it every encouragement. Thanks to the exertions of some half dozen gentlemen, among whom a merited prominence must be accorded to Colonel W. C. Church, of the *Army and Navy Journal*, and to Captain J. W. Wingate, the National Rifle Association was formed; and the fine rifle range at Creedmore, now open to the public, is the crowning result of their labors. Creedmore, though not so large as Wimbledon, has many advantages over it, being as flat as a billiard table, and having extent sufficient to allow numerous parties to try their weapons at all possible ranges. Every advantage has been taken of the experience acquired by riflemen at Hythe and Wimbledon, and the targets are the same as are used in England.

Of course there has been, as there always is, in the initial movement of such an important subject, a certain amount of apathy, but our military organizations and sportsmen are rapidly becoming cognizant of the fact that although they might be the possessors of the best guns in the world, they might be surpassed by foreigners in the use of their arm of predilection—the rifle.

Perhaps a field for rifle practice never was opened at a more opportune time. We doubt if in any country so much ingenuity has been directed towards fire-arms, or with such brilliant success, as in the United States, and, with all respect to ordnance officers, we are inclined to think that it is just on such a ground as Creedmore that the merits of the gun of the future will be proclaimed. It will be at Creedmore that the rifle which shoots the hardest and closest, loads and repeats the quickest, stands the hardest usage, will by popular acclamation be adopted as the gun of the soldier or the sportsman. We are no prophets, but the time will come when twenty thousand people will stand on the pleasant grounds of Creedmore to witness some future rifle contest.

KILLING GAME OUT OF SEASON.

SOMEWHERE about A. D. 1867, Rev. W. H. H. Murray, of Boston, paid a flying visit to the Adirondack region of our State, and the result was the production of a book, the pecuniary success of which was most satisfactory to the author, and a source of astonishment to the many accomplished gentlemen who have for more or less of a quarter of a century, made our northern wilderness a summer camping ground. The publication developed at least one important fact, viz., that the mass of our people confined to our towns and cities, are fond of reading anything, even of passable merit, if it treats of the backwoods and its kindred associations.

On the first Wednesday of our present month of August, Mr. Murray returned from "his annual excursion" to the Adirondacks. In this trip he was singularly unfortunate in violating the laws of nature and breaking the statutes of our State. But for his own confession, the world would probably remain ignorant of his dereliction; but Mr. Murray is not one of the reticent kind, for he recounts his "victories" over as a "brave" returning from the "war path," and like a red-handed Indian, shakes his scalp in the faces of his tribe, be they in the highway or around the council fires.

Says the red man, when vaunting of his chivalrous deeds, "I have stolen like a cat upon my enemy, and left the bones of the squaw and pappoose to whiten on the plains." Says Mr. Murray in the same vein, "I have deceived the finny tribe and killed and eaten a half score of deer slain by my own hand;" and we add, did this valorous thing in the sickly central month of the summer heats!

Among all true sportsmen there is a bond of sympathy, one touch of which makes the fraternity akin, and within this charmed circle, Mr. Murray has not yet been admitted, and never will be, so long as he continues to slaughter game out of season. What apology can he make for being ignorant of the natural laws, which control the sanitary conditions of the gentle deer? Why has he not informed himself, that in the month of July, the brave blue coated buck of the fall and winter months, is moulting like a sick canary? His antlers, half developed, are covered with "velvet." In his nostrils are hidden away great worms that seem to feed upon his brain and eyes. His gait is unsteady, for like a gouty invalid, he seeks the shallow waters of the lake, in the vain endeavor to cool his fevered blood.

The poor doe, in the sweltering time of July, with all the tenderness of a young mother, is nursing and guarding her fawn, keeping it in sequestered nooks, and only when hunger impels, she hides it away in the matted thicket, that she may browse on the gross vegetation of marsh and hill sides, then returning to her charge, half satisfied of food, and wholly self-condemned that she has been away so long.

The great Juno-like eyes of the dying buck speak louder than words, "that I was slaughtered in my sick bed." And if we were to attempt to eat this "diseased venison," the very touch of the shrunken loin of the stricken doe would have recalled the voice of the poor fawn, appealing for succor in plaintive cries from its hiding place, pining and wasting away until death, more considerate than "insatiate man," puts an end to its sufferings.

We confess we cannot understand this desire to kill for the sake of destruction. How noble by contrast is the assertion of the brave and accomplished sportsman, I kill

no bird unless it has a chance for its life on the wing; and no four-footed game except in its season of health, and possessed of all the advantages which God has given it for escape." That was a grand idea of Leather Stocking's, that he would shoot not a single thing more than was enough for his present appetite. But take heart, Mr. Murray, you are only one of the many who have helped within a few years to almost annihilate the game of the forest and streams of our north wilderness. We remember well, that years ago, at a country house at the foot of Mt. Tacona, that looks out on Great Barrington, there was a book in which tourists inscribed their names, and if inclined, their deeds. And in this book was written in a bold hand, and signed by a well known name, the following memorandum:

"Our party found an abundance of trout, and caught and left 1300 to die upon the banks."

Against this waste we shall wage a constant war. Every practical law passed for the protection of game we shall support to the best of our ability, and we venture the prediction, that the Rev. Mr. Murray will slay no more deer in the Adirondacks again in the hot, sultry month of July.

Then, there are those prominent public officials, Woodson the Governor of Missouri, and his party, who crossed the Kansas line and shot grouse out of season. What shall be said of this deliberate violation of law by one sworn to enforce the law? Is there no grain of principle left in men? Are they not satisfied of the justice and reasonableness of these prohibitive and protective game laws? Toadies treated this more than venial offense as a good joke, because, forsooth, the parties are high in office and position; but for us, the larger the mark the more certain our aim, and for such persons there is the less excuse and slower condonation.

RECREATION FOR BUSY WORKERS.

A GOOD deal has been said about the old fashioned conventional rules which govern employers and employees in England. Pretty generally our commercial usages have been modelled after English principles, and we have found ourselves all the better for having followed them. Our early-closing movement is decidedly English, and owes its origin in the United States to the Anglo-Saxon element in our midst. Not that this most humane measure was one entirely advanced by the employed, but in many cases was suggested by the heads of the most prominent English firms in our midst. This good fashion is then pre-eminently English, and possibly the granting of certain holidays owes its origin to customs of five hundred years ago, when the London burghers were obliged by old ordinances to allow their clerks and apprentices certain hours of recreation, so that they might play at "bowles," or shoot their "bowes" astride of London walls.

Though much might be said deprecatory of the intense, all-absorbing character of an American business-life, where neither master nor men spare themselves in performing their allotted tasks, we must still hail with pleasure the gradual diminishing of the working hours, and the granting of additional holidays to that very much overtasked class of men, the salesmen, clerks and bookkeepers.

One point that is overlooked, however, is this, that the masters do not take sufficient interest in the amusements of those under their employ, and in this there is a wide departure from the good old English precedents. Perhaps this idea may invoke a rather disdainful smile from the lips of a member of some distinguished firm, and he may say, "out of office hours we can have nothing to do with our clerks. We give them their holidays, and they spend them as they please. It is no business of ours." We might reply to him as follows, drawing a Liverpool paper from our pocket: "Perhaps you do business with Staple, Yarns & Co.?" "Of course we do; they are among our oldest and best correspondents." "Well, you will see here a gold medal valued at £20, offered by this old established firm, to be awarded to any one of their clerks who can run the fastest mile." If you take an interest in such matters you would notice in addition that all warehousemen have combined to make up a series of prizes amounting to over \$1,000 to be given to any of their employees who may be the most proficient in some half dozen various athletic sports. You will, herefore, notice that these old firms take most decidedly an interest in the sports of their clerks, and in an indirect way supervise the character of their amusements. They are not alone satisfied with giving them a holiday, but what is better see that the time given for recreation is properly employed.

We have in our large cities, establishments employing in many cases hundreds of young men, and perhaps the suggestions we offer to the heads of such concerns, may in time bear their fruit. Why should not the employees of the two most famous dry-goods houses in the United States, after due preparation, engage in a friendly athletic contest? Perhaps the time will come when, at Creedmore, a Stewart may contest with a Claffin the honor of being the best rifle-shots in New York. Once a movement of this character inaugurated by the employers, the advance of all manly sports in the United States would be immense, and the hours of recreation be not only more liberally given, but more than ever usefully employed. If in colleges, why not in stores and warehouses?

—An advertisement of this character would seem strange with us, but very rightly in England is considered as an extra distinction: "An undergraduate of Oxford of three year's standing, who has rowed stroke of his college boat, proposes to take charge of a pupil, etc., etc."

AN OLD AUTHORITY ON GUNS.

HOW strange it is to take up for perusal some American sporting book of even a half century old. At a book stall yesterday, just such a one was found. Its well thumbed appearance, a perceptible black smudge here and there, as if of damp gunpowder, would lead the reader of to-day, think that its old owner might have taken it into the fields, and when game was scarce, had the studied book, gun in hand.

Laugh at its antiquated ideas? Not a bit of it. On the table lies a host of big books of but yesterday, luxuriant in fancy binding, illustrated almost, in every page, telling of a thousand and one sporting matters unknown to our fathers; yet the modest volume of almost fifty years ago compares favorably with the best of them. Within its pages, one can find in a perfectly condensed way, a thorough treatise on the diseases of the dog, and how to cure him, and all written in the easiest simplest language. To paraphrase a well-known quotation, evidently in those days, "dog diseases were not invented, so that prescriptions could be found for them."

Of course, as to shooting, the sporting manual of 1827 is decidedly forty-six years behind the times. It says "the art of shooting flying has not been practised in this country, excepting by a few individuals for more than fifty years, and in England for not more than double that length of time. The greatest improvements in this science and in the fowling piece itself have been made within but a few years." About the time of the publication of the book, the percussion cap was being introduced, it having followed the pellet made of fulminating powder. Our sound old authority, says "the adaptation of inflammable percussion powder, has made quite a revolution in fire arms, and bids fair to explode the flint and steel entirely." The disagreeable effects of the pieces of copper flying back and striking the shooter are complained about. That was a queer idea prevalent some fifty years ago, and recorded in this book, that although percussion locks could be adapted to fowling-pieces, they would be impossible for rifles, because "the force of the cock of the barrel, will depress the piece, and cause the ball to strike low." What difference could exist in this respect, between the fowling-piece and the rifle, both using the same methods of a falling cock, it is hard to state. But stop; is there not some little germ of thought in this? We are getting every day nicer and nicer exactly on these very same subjects. If one thinks well over it, the fall of the cock, which certainly does something to jar the barrel, and depress the piece, might be prevented by a parallel method of mechanism. Now those *dilletanti* about these matters, will notice numerous new patterns invented every day of locks, where the spring motions and striking points are made not at right-angles but parallel with the barrel, and the makers declare that accuracy will be improved thereby. It is wonderful how much conventionality there is in all things, and how even a gun-lock must follow the forms of one hundred years ago.

"The gentleman of Philadelphia county" who writes the book modestly suggests the possibility of using condensed air to ignite the powder. People certainly in those days must have shaken their heads over this. Undoubtedly they would be quite as likely to be somewhat staggered, if the idea was advanced, that the fulminate in the cartridge could be fired by an electric shock, to be generated in the gun. But this is not only possible, and may be expected any day, some of the most ingenious minds having directed their attention towards its accomplishment. The end they aim at, is precisely that intimated in this book of fifty years ago, to get rid of the jar of the lock.

But to return to the subject of old sporting books. Perhaps their scarcity arises from the fact, that like children's books, of any antiquity, they are so much read, that they are sooner or later absolutely thumbed out of existence.

We do not know who has made in the United States a collection of such books, devoted entirely to sporting matters. Such an assemblage of volumes would be singularly interesting. In them would not only be found, the truest chronicle of the advance of inventive power in the United States, the changes guns had undergone, but a perfect epitome of human nature.

HIGH TIMES AT HALIFAX.—The presence of Lord Dufferin, the Governor General of Canada, at the quaint old capital of Nova Scotia, has set the town in a whirl. A naval officer writes us privately in the following melancholy strain:

"For the last week I have lunched and dined out every day; and what with balls, concerts, garrison theatricals, &c., I have not once been able to "turn in" before three o'clock, and sometimes even later. To-night we give a ball on board ship, for which we have been making preparations for the last five days. To-morrow night the Sixtieth Rifles give a ball, and then, thank goodness, we shall once more lapse into our normal state of quietude! At present it is as bad as the Shah."

The delightful climate of Halifax makes these festivities more tolerable than they are found to be at Saratoga.

THE HON. DAVID PRICE, of Quebec, the owner of no less than thirty lumber mills on the St. Lawrence and the Saguenay rivers, and an ardent sportsman withal, is one of the directors of the newly formed "Anticosti Company," who have lately purchased the island of that name in the Gulf of St. Lawrence—an accurate description of which (the first ever published) we are now printing in this paper. The Island until recently has been almost a *terra incognita*, and a terrible bugbear to navigators.

THE BLUEFISH.

VERY little practical information has been written of the bluefish in works of Angling, and their habits are comparatively unknown. We can trace their peregrinations, it is true—can ascertain on what they feed, and how and when to capture them; but their spawning places, and the occasion of their movements, are still a mystery even to the savants. In those months when they make their presence known along our coasts they are found of various sizes, each size constituting a class or family of its own. They are one of our most highly prized game fish, and excellent for the table, whether baked, broiled or boiled.

Size 1.—The bluefish, or snap mackerel (*Tennodor Saltator*) makes its first appearance at the various inlets between Cape May and Egg Harbor in the latter part of the month of May. These will average about seven pounds in weight, poor in flesh and ravenous as a shark. In June they are found equally abundant off and in Fire Island Inlet, and in a few days thereafter are scattered off Montauk Point, the east end of Long Island, Shagwauna reef, and other reefs adjacent. By or near the 20th of June, depending something upon the forwardness of the season, they have spread themselves over the reefs of New London and to the eastward, on to Block Island, and thence through Fisher's Island Sound. By the 20th of August they are in plentiful supply all through, inside and outside of Vineyard Sound, Nantucket, &c. They have gained flesh, and become quite palatable. The size here described is seldom found to the westward of the Connecticut river. On the main of Long Island Sound it is quite interesting to see them drive the menhaden, or moss bunkers, in shoals, causing a "sleek" on the water as they spill their oil when they chop them up with their great sharp teeth.

Size 2.—Early in June a size of about three pounds weight make their appearance at the same points, though much fatter, and remain in the vicinity of the same grounds for perhaps a month. In July they spread out to the eastward, up Long Island Sound to Saybrook Bar and Faulkner's Island, and westerly to Stamford, and remain until October, though occasionally shifting ground for their food, which, in addition to the moss bunkers, consists of a small species of "shiner," (anchovy.) On some of the outer reefs they remain but one or two days at a time. The writer of this has trolled for them over the reefs at and near Faulkner's Island for two successive days with splendid success, at all times of tide, and on the following day caught nothing. The shoal had left for the main land.

Size 3.—About the middle of July the small creeks and rivers, from Stamford eastward to the Connecticut river, abound in a size weighing about a quarter of a pound, which, in a month grow to half a pound, and these feed on a size still smaller, recently spawned, and scarcely an inch and a half in length. The surface of the Housatonic river, from the railroad bridge to the mouth of the river, is annually covered from bank to bank with countless numbers of this small fry, drifting with the tide as it ebbs and flows, while at the same time a size larger (size 4) say about a half pound in weight, is feeding upon them from beneath. About the 1st of September the small fry are sufficiently large to venture into the Sound, and then they swarm in the creeks and harbors, affording great sport to lads who catch them with a float line, with shrimp for bait. By the month of October both large and small fish are all well fattened.

The peculiarity of this fish is that, by about the middle of October the large size, that weigh from nine to fourteen pounds, are generally found from Nantucket to Watch Hill, around Block Island and outside of Montauk Point; while from Stamford, eastward to New London, on the outer reefs, they are of a uniform size of about two and a half pounds weight, and those in the harbors and creeks are a mixture of small fish just spawned, and a size that weighs from one-eighth to one and three-quarter pounds. Another singular feature is, that by about the 20th of October, or the first freezing weather, these fish, of all sizes, up to two and a half pounds, vacate the northern harbors and sounds; and so sudden has been their departure in many seasons that a change of tide has utterly emptied the waters of their teeming fish-life, with the exception of an occasional pensioner who had been bitten or disabled, and dare not run the gauntlet for southern climes. More singular still, the great mass of fish, except the newly spawned, take the coast within one or two miles of shore, part of them stopping, if the weather permits, at the inlets of Fire Island, Egg Harbor, Townsend's, Canarsie Bay, Cape May, and so on along shore, using up all the feed, therein, and by the month of December they are found in the creeks and rivers of North and South Carolina, where they remain through the winter, to migrate the next season to northern waters.

But what becomes of the small, newly spawned fish that disappeared the previous fall? Have they been eaten up by the larger fish on their journey? or do they remain at the North? They are not seen in the South, nor do the larger fish spawn there.

It is only about forty-two years since the bluefish first made its appearance in our waters. It is one of the finest of mer chantable fish on the coast, and for sport is game to the death. On the reefs they are generally trolled for, but will take the hook with live bait. In October, near the close of the season, large catches are made off Montauk Point, and from Watch Hill eastward through the Vineyard Sound, that weigh from ten to fourteen pounds, and are fat as seals; so also in Canarsie Bay, in some years, they have been taken from twelve to eighteen pounds in weight. But it is only in

rarely exceptional cases that these great fish are taken west of Plum Gut.

The bluefish fraternizes with the weakfish, or squeeteague, on inshore grounds, and are of large size, say from five to twelve pounds. Both of these fine fish are taken with the squid or jig in the surf at Montauk, Newport and elsewhere, and afford the most exciting sport—the angler, often standing waist deep in the breakers, throwing his squid to incredible distances by practice, and dragging the fish by main strength to *terra firma* when he has struck.

The bluefish seem to be increasing year by year in size and numbers, individuals having been caught at times weighing between twenty and thirty pounds, whereas a twelve pound fish was regarded as something remarkable twenty years ago. Large shoals were also uncommon until within the past dozen years.

Four generations of fish make their appearance in our waters at the same time. The bluefish is a migratory fish, passing his winters at the South and returning to the North with the advent of warm weather.

THE COACHING REVIVAL.

FROM the other side of the water comes a pleasant rumble. An effort is being made, and with considerable success, to revive the old coaching days, with their prancing steeds and sumptuous drags, and to-day such equipages are bowling over the pleasant hedge-skirted English roads. Will there ever be a second Phæbus Apollo like Sir John Lade, who in a hippic way, might have been supposed capable of threading a needle with his tandem? Will there ever be a new contestant, who could accomplish Lade's feat of driving twenty-two times a coach-and-four at full speed through a gate only two inches wider than his carriage wheels? Perhaps not on our sober and established highways, graded and macadamized as they are, and policed with regulations against fast driving and reckless feats of skill. But we opine that few persons will be found in any age or clime to outshine the achievements of the genuine Overland stage-driver who drives his four or six in hand along the verge of ticklish precipices and down the canon steep where to miss a footing is to leap to certain death. Possibly some dilapidated spark may find in coaching professionally an honest employment; and who can tell but that some sporting *habitué* with fallen fortunes, will not risk his last three or four thousand dollars in the purchase of some neat team and drag, and donning livery himself, drive out aristocratic fares through the Parks or along the "Bloomingdale Road."

Railroads to-day mean greatest speed—the annihilation of space and time. But the tourist in search of simple recreation and pure aesthetics, much more enjoys the rumble of the slower coach, with its easy stages and its many comforts of wayside inns, cooling fountains, and diverting landscapes. There is a journey from Woodstock, New Brunswick, along the St. John river, past the Indian village of Tobique, past the Grand Falls of the St. John, past its many tributaries and along the great lake Temiscouta, to Three Rivers on the St. Lawrence river, which affords one of the most enchanting coaching routes in the country. Another equally agreeable and novel is the 150-mile journey from Pictou, Nova Scotia, across the straight of Canso, and along the Bras d'Or Lake to Sidney, Cape Breton.

We must go to the Provinces for these opportunities now.

A JOKE ONLY 265 YEARS OLD.—Of course, we all have heard it. It is the story of the master who was an egregious story-teller, and of his faithful negro-servant, who always considered it a conscientious duty to swear to his master's lies. The master shoots a deer through the top of the ear and the hind foot, (so he says) and Cuffy vouches for it, dovetailing the lie, by alleging that his master shot the animal when it was in the act of scratching itself. Here it is, in a common place book of one Master George Fox written down A. D. 1608. We transcribe it in the old text:

"A gentleman, very prodigal of his speeche, which made his mouth often to run over, recounted that having one day strolled out into the forest with his bowe, he at one shoot cutte away a deare's ear and his foote together, and killed a foxe. The company saying it was impossible, his man, which stood bye, accustomed to smooth his master's lies said that the deare *cratching* his eare with his hinder foote, lost bothe, and the arrowe glancing, killed the foxe; yet with this hint in his master's ear, that he should next time lye within compasse," for quoth he, "I had never so much ado as to bring the eare and foot together."

Truly there is nothing new under the sun.

The Hartford *Courant* has been estimating the chances one runs of being struck by lightning, and figures it up, that in 1870, 202 persons died from its effects. Taking the increase of population from 1860 to 1870, to have been about 7,000,000, the increase was only eleven. The absolute ratio seems to be forty-two deaths by lightning for every 100,000 cases of mortality. The strange rule found by French observers seems still to hold good that males are more prone to be struck by lightning than females, 148 men having been killed, and only fifty-four females. During the same years of observation, there were 1,345 deaths by suicide. Other words an individual is six times as likely to kill self, as lightning is to kill him.

—Four lions broke loose lately from a menagerie where in Belgium, and a regiment of infantry had called out to quell them.

WOODMAN SPARE THAT TREE.

THE direct evil effect of the indiscriminate cutting of the woods and forests has become a topic of general comment. Once the Ohio river ran as an almost unbroken stream, all the year around, from Pittsburg to its junction with the Mississippi. To-day the waters are so shallow, impeding navigation to that extent, that the West is awakening to the fact that unless some effort be made, the Ohio will be impassible for boats of even a light draught for fully six months in the year. Huge works to cost millions of dollars are spoken of as necessary to restore the river to its former condition. As a leading journal justly remarks, "the difference between the Ohio now and a hundred years ago undoubtedly lies in the destruction of the forest which once almost completely covered the area watered by the Ohio and its northern tributaries."

Of course civilization has its requirements, but we rarely can infringe with impunity on the primitive condition of things without nature asserting some of her rights. If the cutting of the Suez canal and the proposed planting of trees on its banks may probably in time make meteorological changes of importance, perhaps for the benefit of the whole country, in like manner the denuding of whole sections of land of their trees, must exert a contrary and pernicious action. Professor Newberry, of Ohio, says:

"A dense forest growth is a great equalizer, both of temperature and of the flow of surface water. While the forest is unbroken it acts as a blanket, covering the soil, protecting it from the winds, both drying and chilling. It serves, also, as a great sponge, receiving and retaining moisture, and allowing its gradual escape. When the forest is removed, however, and the soil cultivated, the surface smooth and the drainage facilitated, as it is in a thousand ways, and the sun and winds admitted, the effect cannot but be marked, even though the annual rain-fall be not materially changed."

The remedy lies in the judicious cutting of the forests. Some day, when the natural sequence of things is better understood, men will cease, from motives of self-interest, this indiscriminate leveling of the woods; but until they are thus actuated it would be neither tyrannical nor unwise to have some legislative action adopted to prevent this growing evil.

Sea and River Fishing.

GAME FISH IN SEASON IN AUGUST.

Bluefish, (<i>Temnodon Saltator</i> .)	Striped Bass, (<i>Labrax Lineatus</i> .)
Salmon, (<i>Salmo Salar</i> .)	Trout, (<i>Salmo Fontinalis</i> .)
Sea Trout, (<i>Trutta Marina</i> .)	Black Bass, (<i>Centrarchus Fasciatus</i> .)
Grayling, (<i>Thymallus Signifer</i> .)	Land-locked Salmon, (<i>Salmo Gloveri</i> .)
Maskinonge.	

Salt water fishing is now in its prime, and the Atlantic coast from Buzzard's Bay to Cape May is swarming with bluefish, striped bass, and weakfish, besides the other varieties of scarcer or more sluggish fish, such as Spanish mackerel, kingfish, sea bass, black-fish or tautog, porgies, sheepshead, &c. Within the present summer an unusual variety of comparatively strange fish and heretofore unknown in the waters of the North Atlantic, have made their appearance in this latitude. They are caught in the seines and traps of the market fishermen. We described three of these varieties in the last issue of FOREST AND STREAM. All are peculiar to the Caribbean Sea and other tropical waters. It is only two years ago that the pompino, a great delicacy of the Louisiana coast, was first observed here. The drum, sheepshead and kingfish are all recent comers, and even the bluefish was unknown forty years ago. It would seem that the temperature of the water, like that of portions of our globe, is becoming warmer, and that climatic changes are causing this immigration from Southern seas to our own. What are the specific causes, we must leave to hydrographers to determine.

Although the weakfish does not come within the category of legitimate game fish, he is a beautiful specimen of the finny tribe, and under conditions presently to be mentioned affords sport of the most exciting and interesting character. This fish is also known as the suckermug, squeteague, and sea-trout. He is marked by gorgeous spots upon a ground of blue and silver, and by red and yellow fins, which are characteristic of the fresh water trout, and have undoubtedly given to it the name of "trout" in some sections. Ordinarily it is caught by hand-lines fished from a boat. These weakfish come in with the tide in immense shoals, following the small fry upon which they and their congeners feed, and are caught by the boat-load at half flood, within a few feet of the surface. Bait with a shrimp or shedder, and keep the line constantly in motion, and half the time you will "jig" them in the belly, tail or side, as the finny mass moves over the hook. Down at the "Narrows" of New York Bay, near Fort Richmond, is a favorite place. In New Haven harbor, and other harbors of the Sound, and especially in the vicinity of Montauk Point, Long Island, they are taken in great numbers. However, no one but market-fishermen and novices take weakfish in this way. They prefer to fish with rods and finer tackle in deeper water along the edges of channels and tide-races, where the rocks or shifting sands form shelves and ledges to which the small fry gather for safety and where bits of organic matter are drifted by the tide and deposited. Here the weakfish run singly and much larger in size—four times the weight of those "schooling"—coming along under the still water of the ledges where their prey is huddled, and gulping down large masses at a mouthful. These big fellows are designated as "tide-runners." They weigh about four pounds, and pull well in a five-knot current.

But there is another mode, still, of taking weakfish, of which, verily, many an old fisherman wotteth not. Attention, all! Take a "cat-rigged" boat, a craft with a mainsail only and mast stepped well forward, one that works quickly, for quick work is required, and go to Fire Island Inlet at half ebb. At half ebb, or when the tide is running out like a mill-tail, is the only time to take them. Should you attempt the experiment on the flood, you would lose your boat and your life. Let there be a good stiff quartering breeze, and now with a steady helm and a good rap full, bear right down on the beach, mounting the very crest of the waves that in ten seconds more will break into shivers on the sand. Keep a quick eye, a steady nerve, and a ready hand. You will take the edge of the swift current where it pours out of the inlet. Fear not the mounting "combers," or the breaking foam, the tide will bear you back and keep you off the shingle. Right here at the mouth of the inlet, the action of the tide is constantly washing out the sand, and as it is borne down on the current, it presently sinks by its own specific gravity, and gradually piles up until it forms a little ledge a foot high or more, just as the driving snow in winter is borne over the crest of a drift until it forms a counter-scarp, with an apron hanging over the abrupt and perpendicular verge. Right under the edge of this ledge the small fry congregate, and the "tide-runners" forage for food. Here throw your "squid." Just now is the critical instant. In two seconds you will either be founding on the beach or surging down on the impetuous current of the strong ebb tide. The breeze is blowing fresh. Up mounts your boat on the glassy billow whose crest is foaming just two rods in front. A false move now is ruinous. Ready about, hard down your helm! Now! while she shakes, toss in your "squid" into the deep green brine. There, you have him. Keep her away, and haul in lively. Hurrah! a four-pounder. Lift him over the rail easy; belay your sheet there—steady! Whish! away we go, with wind and tide fair, and a seven knot current, and in a jiffy are swept many rods off from the land, and ready to repeat the manœuvre again. Clear away your line, come about, and charge up to the beach once more. What can be more exciting? No time to stop for lunch now. Here we have all the attractions and excitement of yachting and fishing combined, with every sense on the alert and every nerve tautened to fullest tension. Who will dare turn up his nose in contempt of weakfishing.

Striped bass are rapidly working their way to the southward, and along our own and the adjacent shores of New Jersey, a small run of fish that average a pound in weight, have been taken with shrimps or shedders by fishermen while angling for weakfish. Mr. Masters, of the Brooklyn Sportman's Emporium, however, took some off Gravesend at the close of last week which ran up to six pounds. In a fortnight the season will be at its height and big fish running.

Anglers are having fine sport taking blue-fish with a rod in the vicinity of Fire Island, both inside and outside of the Bay. They are of large size, running from ten to thirteen pounds. An ordinary two-jointed bamboo bass-rod is used, with float and sinker, and shedder crabs for bait. A wire snell is requisite to prevent the fish from snapping off the line. Those who have tried it pronounce the sport very exciting.

George Evans, Esq., of Brooklyn, returned last week from the Thousand Islands, St. Lawrence river, where he took one hundred and fifty black bass, some of which weighed four pounds. He used a spoon.

The Rangely Lake Hatching Association are constructing a hatching house at Rangely Lakes, and have put in 40,000 grown fish. This association will propagate both salmon and trout. The works are very large.

Mr. H. O. Stanley, Fish Commissioner of Maine, has just caught a salmon weighing twelve pounds, in the St. Croix river, near Vanceboro, the first taken for forty years in those waters. It was caught with a fly.

Members of the Oquossoc Club took from the Rangely Lake waters in Maine, this season, over 1,000 speckled trout, which averaged a pound apiece. The largest weighed eight pounds.

A WAIF FROM THE SEA.

A venerable fisherman who has had sixty years of experience, utters this complaint of the disregard of all amenities among the fishermen of Cape May:

EDITOR FOREST AND STREAM:

Fond of the sea in all its majestic beauty, and seeking retirement from the busy world, I launched my little boat from the quiet landing at Van Gilder's, on Mill creek, in the town of Seaville, Caye May Co., N. J., one beautiful morning, just as the tide began to ebb, and the sun pushed his radiant portion of a circle above the eastern horizon, and took my crooked, winding course for Townsend's Inlet.

The occasional sudden splash of an eel as he rolled from the bank, or the sweet, clear whistle of the willet, reminded me that I was not alone in the world, though the deep-gorged creeks entirely shut me out from the sight of man. Thus I wended my way across the beach, looking seaward and upward as the breakers foamed and lashed the sand beneath my feet—seaward, as I trembled lest the ocean should forget its jurisdiction, and upward in remembrance of the Divine command, "Thus far shalt thou go and no farther."

The sight was grand, as the foam-capped billows came frolicking in like flocks of snowy sheep, and the sea-gulls, with graceful curve of wing, darted beneath the waves in search of prey. One in particular attracted my attention, sailing round and round an eddy, swaying to and fro, as if to watch the graceful motion of some royal fish beneath, when suddenly down, out of sight, and up again, sailing towards the beach, and over my head, lo, from its bill

there fell at my feet, no fish, but a roll of manuscript. With eager haste I opened it and found the following:

"History of Sir Isaac Walton, the fisherman, from Sir Isaac's lips before he breathed his last.

"My ancestors were fishermen of Gallilee, with Peter, James, and John, but my father, Isaac, whose name I bear, came to this country in 1780, with Lord Cornwallis, who, landing his army at this inlet and finding the country a trackless desert, detailed Col. Watson with his corps of engineers, to open a road through to Egg Harbor. The work was quickly but roughly done, without the aid of compass, and the British army marched triumphantly through its beautiful concave bed, amid the shouts and cheers of the people in the vicinity. It was a crooked road, made without regard to either lines, curves, or angles. Its sidewalk, equally as well defined as the road, commingled its beautiful irregularities with the grades, in manner much like the creeks emptying into the Sound, they having no bottom to the mud, and it having no bottom to the sand. This road was left by the noble English lord as a legacy to the people of Seaville, together with many a brave soldier who built it, with the injunction that it should never be altered, amended, or disturbed till the day when time shall be no more. Hence its present condition.

"But to my history. My good, kind, genial old father died at three-score years and ten, full of honor, and full of scales, leaving the little family a small farm with fishing privileges usual in those days, and to me his boat and fishing gear, with the injunction that in all my piscatorial excursions I should strictly adhere to the following rules, viz.: 1st, faithfully study the nature and habits of the fish you seek; 2d, give freely of your catch to your neighbor; 3d, never make a noise as you near the fishing ground; 4th, never pass your boat over the lines of other fishermen; 5th, anchor your boat even on the tide with other boats; 6th, avoid the company of every man who refuses to observe these rules; 7th, be a gentleman at all times and places; 8th, fool the fish but not yourself. And now, my dear friends, he said, as he cast his eye around the grotto of the mermaids, in which was congregated the various tribes of whale, sheepshead, drum, bass, blackfish, mackerel, skate, tautaug, porgee, weakfish, shark, dogs, goody, oysters, shad, stingaree, and, though last but not least, the bluefish, I call you all to witness that I have kept all these rules from my youth up; not one jot or tittle of them have I broken, and I call you also to witness this day how these good rules been broken and trampled on by the fishermen of this region. The citizens of South Seaville, it is well known throughout the length and breadth of the land, are hospitable, kind, honest, truthful, religious, sentimental, charitable, not given to tattling, sober, and discreet, but the fishermen are shamefully ignorant of the rules and etiquette of fishing, which should, and in other parts of the world do, govern the conduct of every true disciple of mine. In these waters I have been singled as a target to be run over by passing boats; my hooks caught by center-boards; anchors thrown over my lines; boats rushed as near to me as possible in order to frighten a shoal of fish; my kellock has been fished; men, like dogs in the manger, have purposely upset my fishing, and when remonstrated with, reply, "fish are not frightened by passing boats, and all old fishermen say so." These things are so. Yes, the Reach, Seaglies, Brothers, the Sounds, Ware, Thoroughfare, and a host of places are witnesses to it, and I have been grossly insulted." To which the whole convention unanimously cried out, "amen, amen!" and as the last echo of this loud response reverberated through the grotto, the noble stock of the house of Walton gathered up his remaining strength, and rising to his feet exclaimed, with the death rattle sounding in his throat: "My friends, by reason of these things my days have been shortened. To-day I go the way of all flesh. My last request is that the rules that governed me for three-score years and five, be put up in the mouth of every creek and thoroughfare in this your jurisdiction, so that the way-fisherman, though a fool now, may read and become wise hereafter."

SAVING HUMAN LIFE.

Accidents to fishermen, yachtsmen, and sportsmen are so frequent that it is wise that not only they, but the general public should be thoroughly acquainted with all the methods of resuscitating persons taken from the water. We copy in full the series of rules published by the executive committee of the Life Saving Society of New York for the treatment of persons who may be rescued from the water in an insensible condition:

RULE 1.—To drain off water from the chest and stomach: Instantly strip the patient to the waist. Place him face downward, the pit of his stomach being raised above the level of his mouth by a large roll of clothing placed beneath it. Throw your weight forcibly two or three times, for a moment or two, upon the patient's back, over the roll of clothing so as to press all the fluids in the stomach out of the mouth.

RULE 2.—To perform artificial breathing: Quickly turn the patient upon his back, the roll of clothing being so placed beneath as to make the breast-bone the highest point of the body.

Kneel beside or astride patient's hips. Grasp front part of the chest on either side of the pit of the stomach, resting your fingers along the spaces between the short ribs. Brace your elbows against your sides, and steadily grasping and pressing forward and upward, throw your whole weight upon chest, and gradually increasing the pressure while you can count one, two, three. Then, suddenly, let go with a final push, which springs you back to your first position. Rest erect upon your knees while you can count one, two, three; then make pressure again as before, repeating the entire motions at first about four or five times a minute gradually increasing to about ten or twelve times.

Use the same regularity as in blowing bellows, and as is seen in natural breathing, which you are imitating.

If another person be present, let him, with one hand, by means of a dry piece of linen, hold the tip of the tongue out of one corner of the mouth, and, with the other hand grasp both wrists and pin them to the ground above the patient's head.

After-treatment.—After breathing has become natural, dry the patient briskly. Wrap him in blankets only, and let him be kept perfectly quiet. Provide free circulation of air. Give brandy and water—a teaspoonful every five minutes the first half hour, and afterward occasionally as may seem expedient.

1. Avoid delay. A moment may turn the scale for life or death. Dry ground, shelter, stimulants, &c., at this moment are nothing—artificial breathing is everything—is the one remedy—all others are secondary. If the breathing has just ceased, a smart slap on the face or stomach will sometimes start it again, and may be tried incidentally.

2. Prevent friends from crowding around the patient and excluding currents of air; also from attempting administration of any stimulant before the patient is well able to swallow; the first promotes suffocation, the second fatal choking.

3. Avoid impatience of results. Any time within two hours, you may be on the very threshold of success, without there being any sign of it.

In suffocation from smoke, coal-gas, or other poisonous gases, as also in hanging, proceed in the same way as for drowning, but omit Rule No. 1.

In case of sun-stroke lay the patient in the shade, in free current of air; loosen the clothing, raise the head slightly, and pour upon it a small stream of cool water.

The following important suggestions to bathers are also given by the society:

Avoid entering the water within two hours after a meal; or when exhausted from any cause; or when the body is cooling after perspiration. Stay in the water usually not more than fifteen minutes.

Leave the water always and dress with promptness, and dress at once. Do it immediately on suffering from chilliness, especially if there be numbness of hands and feet.

The best time for bathing for strong persons is before breakfast. For the young or weakly the best time is two or three hours after breakfast.

Bathing should be entirely avoided by those in whom it habitually causes faintness, giddiness, or disagreeable palpitation of the heart.

Exposures of the head to the sun during bathing is attended with special danger of sun-stroke.

The proper method of bringing a drowning man to shore is to approach the drowning man from behind. Seize him with your left hand by the hair, coat-collar, or shoulder. Turn him upon his back, and then place his head upon your chest, and, with your right arm free, swim upon your back to the land. (If by the left hand alone it be too difficult to turn him upon his back, apply, in addition, the right hand to his right shoulder, and the turning will be easily accomplished.) If he be conscious, encourage him and direct him to straighten out his legs.

If the drowning man be out of sight under the water, watch carefully for the rising of a bubble upon the surface; he will usually be found directly below it.

Yachting and Boating

HIGH WATER, FOR THE WEEK.

DATE.	BOSTON.	NEW YORK	CHARLESTON
August 21,	h. m.	h. m.	h. m.

The storm of last week interfered sadly with the programme of the New York Yacht Club, now on its annual cruise. It kicked up an ugly sea on Long Island Sound, and compelled the yachts to run into the several harbors for shelter, where they remained for two days weather-bound. None of the skippers felt inclined to improve the opportunity thus afforded to test the sea-going qualities of their jaunty craft, but preferred to lay snugly at their chains under the lee of the land. The daily press have very unjustly, we think, joined in chaffing these amateur tars and jolly yachtsmen for their lack of pluck in declining to weather out the storm. We much doubt if these writers have any idea of the nasty chop which can be kicked up on the Sound, and we fancy if they had been in the places of those they so glibly ridicule they would have done precisely as they did, and put for harbor. If they didn't they ought to. It is better to do this than to start your seams and lose your top hamper. As the pursuit of the squadron is pleasure, and not a cruise in the high latitudes or across the Atlantic, it seems reasonable that the sailing masters and owners should choose a clear sky and a smooth sea, even at the risk of being called "fair weather sailors." We are free to affirm that it was by no means a lack of courage or seamanship that made them seek security, as the sailing masters and crews are picked men from the mercantile marine of the world, and no one will gainsay but that the owners are at times recklessly daring. We must all recollect that even in these prosperous times the richest of us dislikes to have a brand new set of racing sails split to ribbons just on the eve of the greatest regatta, as regards cups, purses, &c., ever held at Newport. Most all of the yachts carried two sets of sails, one for cruising and the other for racing, and the majority of the yachts that sought good anchorage were in good racing trim.

What would some of our roadsters think of trotting out their light wagons over stony roads, or through deep mud, to test the strength of their wheels and axles, the wind and bottom of their fast steppers, and their own pluck to endure a cold and pelting rain-storm? "How high is dat?"

The New York Yacht Squadron started again, August 18, from Newport on a cruise. It was the intention to anchor overnight at Oak Bluffs, one of the worst anchorages on the coast with the prevailing wind. The weather again was very dirty and stormy, and after cruising for an hour or so, several of the yachts coming to grief, the commodore very properly signalled from the flag-ship the order to return to Newport. The stragglers came in one by one, and reported on board the flag-ship for consultation. The schooners Alarm, Resolute, Madeleine, Tarolinta, Rambler, Columbia, Tidal Wave, Josephine, Idler, Foam, Eva, and Clio, and the sloops Vision and Vindex were represented. Talking over the morning sail the damage was found to be considerable. The Columbia had snapped her main gaff, the Vindex sprung her mainmast, the Vixen sprung aleak in her sternport, and the Eva parted her starboard shroud. After some little discussion, it was decided for the present to give up the visit to Martha's Vineyard, and a telegram to that effect was immediately despatched to the proprietor of the Sea View House.

The Bennett and Douglass cups will be sailed for to-day. If the races are all concluded by Friday night the fleet will leave on Saturday morning for the Vineyard, and return to Newport on Tuesday.

The following yachts have entered for the Bennett cup:—Tarolinta, Madeleine, Tidal Wave, Idler, Foam, Alarm, Eva, Clio, and perhaps the Madgie. The boats will start from an imaginary line between Fort Adams and the Dumplings, and sail around Block Island buoy and return.

The New Rochelle Yacht Club have become an incorporated body, and leased Huckleberry Island in the Sound, near the shore. They are about to build a handsome clubhouse and dock, to cost about \$6,000. The club comprises about twenty yachts, and doubtless will meet with the success it deserves.

The fourth annual regatta of the Charlestown Yacht Club took place August 18, off Long Island. Twelve boats entered. The course for first-class yachts was fifteen miles and for second-class twelve miles. Mystery took the first prize, an elegant silver pitcher, and Daion the second prize. In the second-class Bullbow took the first prize and Odd Fellow the second. Center-board boats, Lilley took the first prize, and Napoleon the second.

The Atalanta boat club held their twenty-fifth annual regatta, and the first regatta on the Harlem river, on Saturday, August 16th. The weather looked ominous in the morning, and deterred many friends of the Atalanta's from participating in the favorite pastime. At twelve o'clock the sun poured down with a vengeance. Many members going down by rail swelled the number on board the steamer (N. Seymour) and barge to almost 600. Take the regatta as a whole it was a great success; take it as an exhibition of rowing, it was scarcely satisfactory; the course should always be kept as clear as possible, the starting point distinctly seen, and the starter heard by pistol shot otherwise.

The first race senior sculls; entries: J. C. O'Neil, majenta and lavender; E. Blake, red and crimson; Eben Losee, purple and red. Distance two miles. Losee took the start, and was fouled by Blake, who upset; O'Neil gave up rowing, and Losee won at good pace, making the distance in fourteen minutes fifty seconds. The second race junior sculls; entries, James Goodrich, George Young, W. A. Penny, and E. Mills. George Young took the first prize, and W. A. Penny the second prize, the gold cross.

The third race, two eight-oared barges entered; the following crews came to starting point. Columbia—W. Knight, E. Mills, Jr., W. C. Mainland, W. A. Penny, P. C. Benjamin, E. Losee, C. D. Zachman, W. H. Shear, stroke, J. B. Burrell, coxswain.

Atalanta—W. T. Mook, J. Withey, A. R. Haddock, H. R. Goodrich, M. B. Cox, George Young, W. E. Silken, C. Earwicher, stroke, A. S. Swain, coxswain.

The Columbia crew took the lead and maintained it throughout, wining easily by three lengths.

The fourth race; married vs. single. The married men had previously won twenty years in succession, but failed to obtain their majority. Married—A. S. Swain, Van Zandt, A. Handy, T. Van Radin, stroke.

Single—E. Blake, H. B. Leroy, C. S. Osborn, J. C. O'Neill, stroke.

This race was for the champion flag of the club. O'Neill's crew had their oars first in the water, and gained a decided start, which they kept up until finish, coming in some four lengths ahead.

Between the races of the Atalanta's the Gulick entered four single sculls, John Bryson, W. H. Sear, Thomas Moore, and J. A. Kobbe, who rowed for the champion badge of the club, valued at \$150, to become the final property of the winner, as the "old Gulicks" are about to disband. The younger members propose organizing a new club in the spring. This race was won with perfect ease by John Bryson, who becomes the happy possessor of the champion badge.

On coming home the sight down the river was very picturesque; the shores lined with people, and the several boating clubs sent their single sculls, pair-oars, gigs, eight and ten oared barges to enliven the beautiful scene. On passing Randall's Island, Wallace's full band struck up "Hail Columbia," boys and children lining the shores, and with their shrill voices giving us a parting salute.

The Saratoga Rowing Association hold a grand national regatta on September 11th and 12th. It is open to all recognized amateur boating associations in the United States and Dominion of Canada. Entries must be made on or before September 1st. Saratoga lake, as everybody knows, is a lovely sheet of water, and has an unobstructed course of five miles straight away. As an evidence of good faith on the part of clubs entering their boats an entrance fee of \$20 will be required, to be returned if the boat entered draws into line. The distance in the single, double, and paired oared races will be two miles. In the four-oared shell race the distance will be three miles—one and a half miles and return. The total value of the prizes is \$3,000. Amateurs only will be allowed to row.

John Kyle, foot of 133rd street, East river, is finishing a new boat for the Harlem River Rowing club; the boat is built of white cedar, Spanish cedar upper streak, forty feet long, three feet seven inches beam, sliding seats. Weight 180 pounds.

George Brown of Halifax, and John A. Biglin of New York, will row an "International Scullers' race," two and a half miles and return in Halifax harbor, Thursday, August 28th, for \$1,000 a side. It is the intention of Biglin if he wins, to challenge the champions of the Tyne and the Thames, in England.

The following are the rules adopted by the Stewards for the government of the International regatta, to take place next month near St. John, New Brunswick. We print them, more particularly to serve the future use of those who may like to defer to the judgment of professionals and honorable experts in regatta rules to be adopted:

1. The races shall take place on the Kennebecasis River, on the usual regatta course, on the 17th day of September; or should the weather on that day prove unfavorable, on the first suitable day, thereafter.
2. All races shall be started in the following manner: The starter on being satisfied that the competitors are ready, shall give the signal to start.
3. If the starter considers the start false, he shall at once recall the boats to their first stations, and any boat refusing to start again shall be distanced.
4. No fouling, whatever, shall be allowed.
5. It is in the province of the umpire, when appealed to, but not before, to decide a foul. The boat decided by him to have fouled shall be distanced.
6. It shall be considered a foul when, after the race has commenced, any competitor by his boat, oar, or person, comes in contact with the oar, boat or person of another competitor, and nothing else shall be considered a foul.
7. Any boat taking another's (boats) water does so at his own peril, and it shall be held that a boat's own water is the straight course from its starting point to its turning point.
8. Each boat shall turn its own buoy, the turn to be made in shore toward Rothesay.

9. If in any race in which more than two boats start a foul takes place, and the boat adjudged by the umpire to have been fouled reaches the turning point first, the race shall be decided as the boats come in; but if the boat fouled does not come in first, or if the umpire is unable to decide which boat has committed the foul, the race shall be rowed over again, unless the umpire shall decide that the boat which came in first had sufficient lead at the moment of the foul to warrant it having the race assigned to it.

10. Whenever the umpire shall direct a race to be rowed over again, any boat refusing to row again shall be distanced.

11. Every boat shall stand by its own accidents.

12. The decisions given by the umpire shall be final, and there shall be no appeal therefrom.

When the affair comes off, another batch of regulations will be issued by which the affairs of the regatta shall be governed.

Shot Gun and Rifle.

GAME IN SEASON FOR AUGUST.

Woodcock, *Scelopax Rusticola*; Esquimaux Curlew, *Numenius Borealis*; Primated Grouse, *Tetrao Cupido*, Blue Grouse of Washington Territory, *Tetrao Cæsius*, and all kinds of Bay birds, including the Godwit, *Limosine*, Curlew, *Numenius Arguata*, Plover, *Charadrius*, and Sandpipers, *Tringine*. Also such kind of wild fowl as are strong of wing.

Under this head last week an unfortunate blunder was made by inadvertently changing the captions of two articles that had been prepared, the one for pinnated grouse, and the other for ruffed grouse. It now stands corrected.

The weather during the early part of our current week was decidedly bad for shooting, storms of more or less violence prevailing from Maine to Minnesota, which drove the birds to close cover. If there is anything a dainty bird dislikes it is to get his plumage wet. By this time, however, they have probably shaken out their feathers and are on the wing again.

An almost endless variety of birds is found on the shores and inlets of Long Island and New Jersey. The best feeding grounds are Pelican bar, South bay; Egg Harbour, Montauk point, Forked rivers near Barnegat, several promontories near Stonington, Conn., Currituck Inlet, N. C., and Cobb's Island on the Eastern shore of Virginia. At the two latter named places, shooting commences early in September. The Godwit commonly called "Marlin" are getting scarcer every year. It is a very noisy bird and has an odd shrill cry that sounds like "grutto" rapidly repeated; they are very strong on the wing, of a light grey color, and feed in bogs and marshes near the sea shore, have four eggs, and are very delicious as a table bird.

Curlew are generally very abundant and breed in high, hilly, and sandy grounds. The nest is very slight and usually contains four eggs, placed with the small ends together. These birds have a singular way of just keeping out of gun-shot, and rise with a mournful cry, alarming every bird within hearing, thus spoiling the sport among the Wilets, as at certain seasons they frequently associate with one another. The best decoy is to tie a dark bandanna handkerchief on the top of a small stick, the gunner lying concealed behind some dry drift wood, waiving the decoy and imitating their cry from time to time. It is not thought highly of as a table bird, but when properly cooked with a little lemon, and good cayenne, it is not to be despised.

The plover (several species) have a singular habit when alighting on the ground in the breeding time; they drop their wings, stand with their legs half bent, and trembling as if unable to support their bodies. In this absurd position they will sometimes stand for several minutes, uttering a curious sound, and then seem to balance themselves with great difficulty. This singular manœuvre is no doubt intended to induce a belief that they may be easily caught and so turn the attention of the egg-gatherer from the pursuit of the eggs to themselves. Plovers' eggs are recognized all over the world as a great delicacy. The Wilets, yellow legs and Sandpipers have so often been described that most of our readers are familiar with their habits. The first flight of these birds was seen August 7th, by Cornelius Bennett, from his yacht "Mystic," B. Y. C., Freeport, South side L. I. The most successful way to shoot these birds is as follows: If possible, go out early in the morning on a high flood tide, taking care to select a long narrow sand-bar that is not covered at high water, and one that juts out from the main land; gather some dry drift-wood and build a small blind, scooping out the sand. You can then put out a few stools about twenty-five yards from the blinds on the edge of high water, and commence to imitate their whistle; if the wind should be blowing on shore and the tide likely to be very high, the sand bars will be all covered and the birds, having no place to alight, fly backwards and forwards across this point waiting for the tide to recede. Never pick up the wing-tipped ones, as they act as nature's decoys; they flutter their wings, uttering shrill whistles, and bring down hundreds of others to see "what is the matter." Now is the time to let them have it, as you generally can kill several dozens in the next half hour. Another plan is to sail leisurely down on the birds as they are feeding on the bars; but if there are any Curlew there, look out, as it is necessary to remain perfectly still and hide yourself. The slightest oversight on the part of the sportsmen to observe these laws, the Curlew will instantly give the alarm and your sport is nil. With everything in your favor, tides, wind, slightly foggy weather, the shooting at Curlew is generally at long range. Now and then you may get a crack at them as they fly over at forty yards or so. Your clothes should be of a marsh-grass, or sedge color. Always have the barrels of your gun well "browned;" use a ten bore, four and a half drams of powder, and one and a quarter ounces of No. 7 shot, a pair of rubber boots and a light rubber blanket. For the smaller bay snipe you can use No. 10 shot and upwards,

To-day, August 21st, is held the annual meeting of the Calendonians at Myrtle avenue park, Brooklyn. There are no sports more truly athletic, or calculated to test and manifest the latent nerve power and muscle, than these ancient Scottish games, which always attract large crowds of spectators. The athletes sometimes exhibit wonderful feats of strength and agility, and we expect to receive a startling record from the field in the matter of putting the stone, throwing the hammer and tossing the caber. The herculean performances of the great champion, Downie, are almost beyond belief.

The pastor of a certain Congregational Church in Paterson, New Jersey, is about to be dismissed, a morning paper states. He is thus described:—"He is a talented but erratic young man, a devotee of tobacco, a favorite with the girls, a singer in a quartet, and an active member of a base ball nine. He also writes poetry and plays chess. The old-fashioned members of the church are now looking for an old man who has had the smallpox, and who is too stiff to make the distance between the bases."

Saturday, the 16th, was a gala day for the base ball players. A sharp contest for the championship took place at Philadelphia between the Athletic and Washington clubs, which the former won by a score of 14 to 0. The fielding on both sides was excellent, but the effective pitching and batting of the Athletics won them the game.

On the same day there was a base-ball match at the Capitoline Grounds, Brooklyn, between representatives of the chess clubs of that city and this. The game was played with remarkable skill for amateurs. Several distinguished chess players participated.

On the same day an exciting contest took place at Chicago between the Boston and Philadelphia clubs, in which the Bostonians were victorious by a score of 11 to 8. Over 3,000 persons witnessed the game.

In the game between the Mutuals, of New York, and the Atlantics, of Brooklyn, played at the Union grounds, Brooklyn, on Saturday, the New Yorkers won by a score of 12 to 4.

Also, the same day, there was a wrestling match at New Haven between Homer Lane, of New York, and William L. Kennedy, of New Haven, for \$500 a side. First and third fall for Kennedy, and the victory.

There was a foot race on Saturday at Providence, R. I. The contests were all for short distances, one of 500 yards, one of 150, and the others 100 yards.

First race.—Henry Crandall, of Queen City, Mo., and J. A. Stratton, of Fall River, Mass., 200 yards, for \$500 a side. Crandall winner by twelve feet. Time 21½ seconds.

Second race.—John Smith, of Providence, and John Mann, of Pawtucket; 150 yards, \$100 a side. Smith winner by two feet.

Third race.—W. A. Kendrick, Mt. Sterling, Ill., and John Allison, of Providence, 100 yards, \$250 a side. Won by Allison by two feet in ten seconds.

Military News.

IT is nevertheless a fact, say what you will, that promotions in the army are few and far between, particularly in peace times. Occasionally, it is true, some good man enters the army and after long service, or some act of gallantry on the frontier, obtains a strap if he passes the required examination; but the promotion of enlisted men is rather an exception than a rule, not only in our army but all armies. But few, fortunately, enter the service with the idea of rising to a commission, the majority enlisting for the mere sake of a livelihood, others for an adventure, and others again, we regret to say, as a means of covering crime or of flight from civil justice. The army draws to itself some of the worst classes, we are free to say—men whose ambition never reaches the grade of a commissioned officer. The positions of second lieutenants, to some extent, are filled from civil life, and when such vacancies exist, after the assignment of the West Point graduates, sometimes twenty applications are made for each vacancy. These vacancies are generally filled by the sons of officers, intelligent department clerks, etc., the number from the ranks of the army being invariably in the minority instead of the majority, as it should be, if encouragement for faithful performance of duty is to be the rule in the army. Recently the President selected some forty names from a list of about 400 applicants for appointments as second lieutenants in the regular army, and the majority of these were selected as above stated. Yet in this little batch there were some promotions from the ranks, and even a Modoc volunteer (a private) was recommended for a commission. These promotions are well worthy of publication, we therefore append them, as follows:—Commissary Sergeant William Allen, at Camp Apache, A. T.; Frank S. Hinkle, sergeant of company A, Fifth Infantry; James L. Murray, an enlisted man of the army; William C. Roundy, sergeant of the Twenty-first Infantry; John Sheldon, sergeant-major of the Second Infantry; Sergeant Theo. Smith, of the signal corps; Fred. Theiss, sergeant of M company, Seventh Cavalry, and last, but not least, in these "hot spells," James C. Winters, a Modoc volunteer. This list shows that less than one-quarter only of these promotions are made from the ranks. This ought not to be so, still the inferior character of the men generally enlisted has much to do with this.

The subjugation of the "Peace Commission" Modocs, after a somewhat protracted campaign, does not seem to

have settled the Indian question, if the latest news from the frontier is any indication of the peaceful inclinations of these poetical Lo's! These poor fellows are roaming about attacking unprotected settlements, stealing horses, etc., and never missing a chance to take a scalp. One of their nice little bands has been making some fun in the vicinity of Fort McKavett. Lieutenant Wheeler, of the Second Cavalry, with forty men, went after the inhuman murderers of Mrs. Richards and Miss Hall, in the Wind River Valley, some few weeks since, but missed their trail, it having been washed away by the rains. This detachment, however, in the opinion of Colonel Brockett, of the Second Cavalry, was altogether too small, and would have undoubtedly been overpowered had they fallen in with the Indians, who were reported a good force. This detachment (company B) of the Second has had severe scouting service, and the force in the vicinity of Fort Stambaugh, W. T., and other posts on the frontier should be largely increased if the Government ever expects to check Indian depredations. Our little detachments in the Indian country have extended lines to protect, and, restrained as they are by the peace policy of the Government, stand a small chance against the Indians. General Crook has somewhat settled the Indian business in Arizona, but not by a peace policy, and General "Phil" and General Sherman think it about time these savages were either kept on the Government reservations and made to do something for a living, or the troops allowed to wipe a few of them out. It strikes us this peace policy should have ceased with the Modoc war, but as long as the Indian agents send cases of breech-loading Sharps marked "hardware," to the number of 2,000 at a time, as Government annuity, we must expect these murders, robberies, etc., on the part of the Indians. What chance, let us ask, has the poor settler with his muzzle-loader, purchased with his own means, against the improved weapon of the savage purchased by the Government?

Assistant Quartermaster General Ingalls, who left his quarters in the department of the East, New York city, a few weeks since, and proceeded to Europe, has reached Vienna, the city of the exposition. He is on Government commission (not per cent.), and will look after the warlike interests of the United States at the exposition, etc., etc., as one of a board appointed for that purpose. The General, we presume, will, on his return, write a book and tell us all he saw new in the death-dealing line, or any other.

First Lieutenant John W. Chickering, of the Sixth Infantry, "subsisted" just \$51 21 too much a few months ago from Second Lieutenant W. B. Wetmore, of the same regiment, and now he has got to pay for it, as that amount has been deducted from his pay by the Government.

First Lieutenant James H. Bradley, of the Seventh Infantry, is going "beyond the sea" when he gets a chance. He has permission to be absent for two-thirds of a year.

Assistant Surgeon Peter J. A. Charey has left Texas to locate in New York for awhile.

Lieutenant General Philip H. Sheridan, U.S.A., is still single. He is a regular "no surrender." It is said more bachelors are congregated in the Eighteenth Infantry, stationed in the South department, than any other portion of the army. Why is this?

The First Artillery, now in the South, but so long established at Fort Hamilton and the adjacent forts of New York harbor, report has it, don't like the change now "so pretty well." The change in the winter was pleasingly acceptable, but this hot weather—well, we "cannot always sometimes tell," you know.

General Custer, of the Seventh Cavalry, has deserted a "Life on the Plains," and at last accounts, with a squadron of his command, was "pushing things" at the mouth of Glendine's Creek as a part of the Yellowstone expedition. He and his command were then looking for *Josephine*, who was expected to paddle along pretty soon.

General Gibbons, commanding the Seventh Infantry, has been relieved as general superintendent of the recruiting service. Major J. P. Roy, Sixth infantry, is temporarily in charge.

HUNGARIAN RACES.

THE Rakos course is some five miles or so from the centre of the city, on a broad oasis-bordered flat. Horses, riders, and trainers were many of them English. There was the grand stand, the saddling place, and the ring, but they were different from the English institutions of the same names. There is no betting in one sense, but there is a sort of public sweepstakes in which everybody puts down so much on the horse he thinks is likely to win. If he chooses an outsider, the chances are that there will be few with whom he will have to divide his winnings; if he chooses a "hot" favorite, he cannot expect much more than his stake to be returned. The races were much like other races except one for farmers' horses. It was ridden by Hungarian farmers without saddles, and in their natural costume. A huge nightshirt flows down to the feet, and is sewed up to make a loose pair of trousers. A sleeveless waistcoat is stuck on, and the long white arms of the shirt fly loose, a foot or so broad, at the wrist. The head is covered with something like a tea-cosy, or a smoking-cap, with a feather stuck in it, and the dress is complete. The horses were light-looking, but active and business-like, and the riders rode as keenly as if the race was for life. Two of them could not get their restive animals off till the others had run nearly half the course, but they insisted on running it out as faithfully as if they had a ghost of a chance of winning. Over every incident of the race the excitement of the crowd was as great as it could have been at home, and the "road out" was as dusty and as full of perilous chances to carriage or rider.—*Macmillan's Magazine.*

—A French firm is manufacturing paper with considerable success from the residue of hops.

Art and the Drama.

BLACK Crook on Monday, August 18, was offered to the patrons of Niblos', and was greeted of course with a crowded house. Some years ago, when this "spectacle" was first presented, it was a matter of great speculation, even among the most hardened playgoers, whether it could maintain itself; we doubt if the managers at first were altogether at ease on the subject. Dating from the day in New York city when Greenough's chanting cherubs, singing "*Gloria in Excelsis*," were, in deference to the public taste, exhibited with their loins girded with modest gauze, to the day the Black Crook appeared, there certainly has been a change, and no one can say that our old times "village modesty" has not been entirely worked out by the "whirligigs" of time.

This is "the fourth revival," if we mistake not. The first era was so long that managers, actors, ballet girls and the machinery were actually worn out with the repetition; but there was an audience to the last night, and the story is, that weeks after the withdrawal there were occasionally found hidden away among the dark recesses of the playhouse "old patrons," who had gone to sleep after the fashion of Rip Van Winkle, praying only to be awakened when the Black Crook again strutted upon the stage.

Now, the text of the play, from an intellectual standpoint, is the most thoroughly bad that is possible. The author, or rather compiler, had no other objects in view than with unmeaning words to kill time enough to allow the scene-shifters to do their heavy work. And so little ingenuity is displayed that the veriest tyro in dramatic tricks is not deceived. As one of the curiosities of the play, in this connection, it is to be recorded that the author of this bosh received more money for the copyright than was ever before paid to any dramatic writer, for one play, from the days of Shakespeare down to the present time. Nay, more; this celebrated literary production provided the author not only with a splendid country-seat and grounds to match, but has left money enough still due to his heirs to make a famous case before our Probate Court!

The original conception of the play has never been essentially improved upon. The regular patrons would not patiently submit to any radical change; in fact, they have insisted upon having all the glowing faults retained, nothing in their imaginations or dreamy reminiscences equaling their first love.

The popular decision of the professed moralist is, that the charm of the Black Crook issues from the lowest incentive that can excite admiration on the stage, viz:—the display of semi-nude humanity. We have endeavored to analyze this judgment, and are forced to a better conclusion, and relieved of the otherwise wretched, degraded notion that many good people, and thousands of simple people, are induced to be spectators from such depraved motives. The fact is, the semi-nude element is so thoroughly involved, and a necessary part of the spectacle as a whole, that it excites comparatively little especial notice, and where it is prominent it is often a source of regret to the majority of the spectators that so much that is for the moment attractive to the eye should be marred by any indelicate display.

It is most unfortunate that the theater has ceased to be a place where nature is imitated in the higher developments of human thought and action. We believe the stage, judged by the success of the Black Crook, has reached a lower degradation than is afforded in any precedent history. The genius of the actor, the intellectual power of the author, are now entirely subordinated to scenic effects, and humanity is only thrust in merely to fill up necessary openings, just as mud is used to stop the chinks between the logs of a frontiersman's hut; the humanity and the mud ranking as equally important things merely to fill up gaps.

The Black Crook is therefore a legitimate feature of the times. The manager, by its design, is relieved of paying for dramatic talent. Their company is purposely organized of the lowest intellectual calibre. If there was a scintillation of true genius, one flash of naturalness in any of its members, the unhappy victim would be discharged, as interfering with the intended effect of the tinsel and the striking glare of the calcium lights. The design considered, merely to produce a spectacle, the managers have done well. In its worst estate the Black Crook, in its language at least, conveys no bad morals. *Herzog* and *Greppo* do not ask us to sympathize with the moralities and afflictions of the heroines of the "society play," and we don't remember any incident in the extraordinary drama where innocence and virtue are designedly made the only victims of dire misfortune and popular condemnation.

We doubt if the drawing of Rogamay, the French caricaturist, will be appreciated, or if the audience will accept kindly, however well they are executed, the series of pictures which are introduced in place of the transformation scene. The pictures are realistic, open to criticism, or within the reach of a majority of the audience to like or dislike, but the charms of that "heaven" to which the lovers of the Black Crook have for years been finally translated was a fit ending of unsurpassed splendor that sent home the majority of the entranced spectators under the impression that a penny "wheel" had been ignited and allowed to whirl its fire and rainbow tints within their confused and throbbing brains.

—Loch Leven trout are very celebrated all over England and Scotland, and are worth two shillings a pound. The latest dodge is to substitute sea trout for them worth ten pence a pound, and disappointed anglers buy them at full figures.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

SCIENTIFIC AMUSEMENTS, or *Recreations in Popular Science.*

Dana Estes, Editor. Boston, Estes & Lauriat.

All lovers of Science will be greatly pleased to notice from the press of Estes and Lauriat, a young and enterprising publishing house in our sister city, this Half Hour series of Scientific tracts.

No. 1, upon *Strange Discoveries respecting the Aurora, and recent solar researches*, opens one of the most mysterious as well as beautiful of nature's grand developments, and promises to further disclose its hitherto hidden beautiful. This paper is decidedly one of surpassing interest to every one who looks upon these wonders of our northern skies.

No. 2 introduces us to "*The Cranial Affinities of Man and the Ape.*" This has been for some considerable time the question of the times, whether the old gray ape of the primeval forests, is, or is not, our great-grandfather. Many persons in this latter day seem disposed to completely ignore Adam. We are not astonished that such a belief should have been entertained near the close of the middle ages, for almost all anatomical knowledge possessed by physicians rested solely upon the study of the structure of the ape. Every one should read No. 2, as a full and concise account of the first Orang-Outang from Borneo, that was brought from Europe.

Nos. 3 and No. 4: *Spectral Analysis Discoveries Explained—Its application—Microscopic Discoveries* beautifully illustrated. The highly interesting theory of the probable origin and nature of spots upon the sun is clearly treated of by Kirchhoff. The uses of science as adopted in explanation of the theory of sound, heat, light, and color—illustrated. An entirely new realm of science is here introduced to the reader, with all the wonderful revelations of physical science. Truly we live in a wonderful and beautiful world: the stupendous works of creation are herein made manifest, and the far-off, obscure, and dim become at once wonderfully clear and plain to our comprehension. Every one should read No. 3, for it is a commentary of sound, heat, light, and color.

No. 5, upon *Nebulae, Comets, and the Coral Islands.*—On a light and clear evening, as we cast our eyes upwards to the heavens, how near to us seem the remotest realms of the universe! behold yon, stellar cluster, a sort of dim outline of a milky appearance in the heavens. What are they? bring out the telescope, if only of a very moderate power, and you behold these clusters of stars which you supposed to be only clouds, revealed in thousands of stars standing out quite vividly against the dark background of the heavens. Then you can faintly appreciate the views which burst upon the sight of Herschel when he applied to these dim clusters his gigantic forty-foot telescope! But even here all was not seen; for far beyond was apparent to his gaze a still farther-off world, a more distant field of starry worlds. A beautiful description of the great nebulae of Orion is here given, worth alone the price of the whole work.

In this paper upon the Coral Islands, the entire history and wonderful organism of these little island-builders is given, and their method of secretion, the very lowest form of animal life, is made a deeply interesting and scientific study. Who would think, when he reads of a terrible shipwreck upon some far-off coral reef, that so diminutive an insect as the little coral insect caused all this disaster? Truly, although a microscopic insect of tiny proportions, yet he is a stone mason possessed of most gigantic power. Twenty fathoms deep, low down upon the bottom of the ocean, the tropical coral reef has its foundation. And many islands covered with a rich and beautiful verdure, rest upon the wonderful coral pillars which were built by these same little stone masons. A wonderful history is this contained in No. 5.

No. 6 opens to our view the great unexplained mental phenomena. *Unconscious Action of the Brain, and Epidemic Delusions.* Under this head the entire doctrine of spiritualism and its many absurd phases are accounted for, and numerous illustrations of mental impressions being taken as realities are explained quite satisfactorily; as for instance, by way of illustration, a lady at a seance in a darkened room, thought she would "like to have a live lobster brought into the room," and presently she began to feel some uncomfortable sensations which she attributed to the presence of this live lobster. The fact is recorded that two live lobsters were brought in, or they thought so; they imagined they felt them crawling over them, &c. All of which was surely a delusion.

No. 7. *The Geology of the Stars.* This, although a deeply interesting disclosure of those contemplations made out in distant heavens, is not strictly speaking a new discovery. Yet it contains matter given to the millions new, and worthy of deep thought; for to them it is a new revelation of the wonderful works of God as revealed in the glowing firmament of stars. The theory, a most beautiful one by the way, of progressive development, is fully stated. Our earth has reached a certain period; it is passing a certain epoch; it brings with it a new revelation to many; that is, it happens by the providence of an all-creative power, to be inhabited. Are not all worlds inhabited? and how long has our earth been inhabited? has it been so from its first creation? Changes are constantly transpiring; history always progressive, tells us wonderful tales, and this little tract will lead the mind from nature up to nature's God, and the soul be filled with the grand contemplations of the truly sublime.

No. 8, and last of these parts, *On Yeast, Protoplasm and the Germ Theory, and The Relation between Matter and Force.* "Yeast!" says one or more of our readers, on looking at the letter of No. 8. Yeast! who cares about "yeast?" and with a contemptuous toss, perhaps, he consigns our No. 8, to the extreme corner of his room. Now this is not fair, you know not how great a power you throw away when you throw away yeast, or its veritable history. Now it is plain to the comprehension of most of our ladies that anything of a liquid kind containing sugar, will when left to itself soon begin to undergo a change. The beautiful colorless liquid soon has a dirty appearance. A yellow scum rests upon its surface; while you notice at the bottom of the vessel the same dirty yellow, which we will call "lees." After a time this "scum" and "lees" stop increasing and the same has become altogether different in quality. The simple sugar water has a pungent smell; it has become a spirit, and it intoxicates if one drinks it. It is now the demon of the bottle. This is after the process of distillation, that old rascal called Alcohol, and if you have any doubts of his being a smart spirit, put a portion on the fire and see how angry he will become. Such were the facts known from old antique days. Antiquity also tells us of a time, too, when the old and wise men "got drunk." Old Noah did; also the Indians. Old Lot on a certain occasion became drunken, and since then many great, good, and wise men have known the power of the last, if not the first stage, of yeast.

But readers, get these little Scientific Tracts. Every one should read them, and give them a valuable binding.

HAP HAZARD, by Kate Field. Boston, R. Osgood & Company.

This is one of our Summer story books, although a portion of these articles have appeared before in various journals of the day. Miss Fields has long enjoyed the reputation of being one of our most entertaining and popular journalists. She is not at all afraid of expressing her thoughts in the most forcible and terse terms; never makes the mistake of calling black white. She is feared as a writer, for she speaks the truth in such manner that evil doers whose sins are often visited with severe lashes from her, stand in abject fear of her wholesome pillory. Few journalists would dare say in their professional capacity what Kate Field utters with utmost freedom. Yet we like Kate, and believe she is doing much good. Although not free from some errors, they are by no means so very grave that we cannot forgive them. She uses some phrases that would be considered inelegant, if we apply not a stronger term. We think her last book, though an earnest expression of her thoughts, could be

improved, (not in elegance of execution, binding, &c., for it is a beautiful work), leaving out a few words and sentences which mar the smoothness of the style somewhat; as, "if it take but two days to demoralize humanity." We commend this little work of Kate Field as one of the reformatory stories of the times, and many readers will find it speaks the truth forcibly and sensibly.

HARPER'S MONTHLY for September, is of unusual excellence. Somehow its editor seems to have the peculiar faculty of always finding not only interesting matter, but that which is particularly adapted to the season. There are two articles on subjects kindred to our own particular topics which are exceedingly well done in the number under review. One is "The Trotting Horse in America," the other "The Twelfth of August," descriptive of the opening of the English shooting season. Mr. Nordhoff's experiences in Hawaii-nee, the continuation of his itinerary, is of great interest. We trust to follow him to Japan, China and all the way home. The *apereu* we have of Stamboul, in the article entitled "General Sherman, in Europe and the East," gives the reader an idea of how Stamboul may be seen under the most advantageous circumstances. There is a general quality of excellence about Harper's Monthly, which makes it not only reading matter for Americans, but for everybody else who can understand the English.

THE LIVE STOCK, FARM AND FISHING JOURNAL for August. Buffalo & New York. This most useful publication, treating all the various subjects of the farm, the dairy, poultry and apiary, with their innumerable collateral branches, is in itself a model of excellence. That portion of the journal devoted to horsemen, is particularly interesting to us, since it shows not only a thorough knowledge of racing stock, but that which is quite as useful, an acquaintance with the ordinary working animal. Sometimes without being exactly optimists, still appreciating the great amount of work necessary to produce such a thoroughly good paper as the Live Stock Farm and Fishing Journal really is, we wonder at the amount of brain, toil, and research necessary to produce it. We trust to be able presently to give a portion of its contents to our readers.

IN PRESS.

Among the forthcoming books of the season, James R. Osgood & Company have in press and will soon issue a work entitled "*Oldport Days*" a volume of essays, &c., on life and scenes at Newport. It is expected this book will make something of a sensation. Also a New Series of "*Tales of a Wayside Inn*" and other miscellaneous poems. Several other very valuable works, are in press and will soon appear, the announcement of which will be found in due time under the literary head of this paper, as above.

RIVERSIDE PRESS, Hurd & Houghton, will soon publish a very elaborate and valuable work, bearing the title of "Painters, Sculptors, Architects, Engravers, and their Works." This work will contain a complete and extensive catalogue of the first workers in the fine arts, with many interesting monographs, biographical notes, and sketches of eminent men never before published. We understand the work is prepared with great care, and is destined to take a high place among the rare and valuable works upon this interesting subject. C. E. Clements is the author. We shall give a full review of this dictionary or companion of the Arts as soon as published.

BOOKS RECEIVED.

We are in receipt of the following books:

THE FISHING TOURIST.—Charles Hallock. Harper & Brothers.

I-GO-A-FISHING.—W. C. Prime. Harper & Brothers.

OLD ROME AND NEW ITALY.—Emilio Castelar. Harper & Brothers.

OLD AND NEW ENGLAND TRAITS.—By George Lunt. Cambridge, Riverside Press, Hurd & Houghton.

THE TRAPPER'S GUIDE.—By S. Newhouse. New York, Mason, Baker & Pratt.

PROTECTION AGAINST FIRE.—By Joseph Bird. Riverside Press, Cambridge, Hurd & Houghton, Reviews of these books in our next.

There was a large attendance of members of the National Rifle Association at Creedmoor, August 16th, and a marked improvement in the general arrangements for the shooting. The National Guard who wish to practice without charge, are requested to make application in writing to the Association; they must be in uniform, and in a body under the command of officers. The following prizes are announced: A prize challenge cup, value \$100; to be called "The Jersey challenge cup;" open only to members of the National Guard of that State. The Hon. Nathaniel Mills of New Jersey, is the generous donor. Captain Wingate, secretary of the Association, makes the following report of prizes offered for competition: Colonel Church, an appropriate silver design, valued at \$700, open to all military organizations in the United States; to be won twice. The State prize of \$500, to the best train of twelve. Messrs. Remington, a gold mounted rifle for the best shot in each train. General Slater gives a \$100 prize; open to the first division; and General Woodward the same, for the second division. A Gatlin gun, open to any military regiment in the United States; to be won three times. Bethel Burton presents a handsome present. The Association gives a number of elegantly designed badges, medals, and what with the many prizes, the total gifts will not fall far short of \$6,500.

The grand meeting will most likely take place on Wednesday, October 8th, and the following nine days; this is indeed a great achievement for the the popular National Rifle Association.

The New York Times deserves the living gratitude of the poor children. On Saturday last, it treated over *eighteen hundred* of them to a holiday and steamboat excursion, the ninth of the series. The pro rata expense was only about thirty-nine cents per head. There is great amount of good done at only a trifling cost. It not only gives the youngsters health and a new lease of life, but it enlarges the scope of their ideas, gives them new views of existence, and breaks the connection of vicious habits and debasing associations. If the mind can be diverted from evil, even for short intervals, the effect is beneficial. The consciousness of the kind consideration shown, the temporary contact with respectable people, the fresh air, the good fare, and the cleanliness, increases their self-respect, and creates an incentive to well-doing and well deserving.

A monster toadstool or fungus has been found growing at Churchville, near Rochester, which measures three feet and seven inches in circumference, and weighs seven pounds and a quarter. It grew to maturity in three days.

PHYSICAL AND INTELLECTUAL LIFE.

THE incompatibility between the physical and intellectual lives is often very marked, if you look at small spaces of time only; but if you consider broader spaces, such as a lifetime, then the incompatibility is not so marked, and gives place to a manifest conciliation. The brain is clearer in vigorous health than it can be in the gloom and misery of sickness, and although health may last for a while without renewal from exercise, so that if you are working under pressure for a month, the time given to exercise is so much deducted from the result, it is not so for the life's performance. Health sustained for many years is so useful to the realization of all considerable intellectual undertakings that the sacrifice to the bodily well-being is the best of all possible investments. Franklin's theory about concentrating his exercise for the economy of time was a mistake. Violent exertion for minutes is not equivalent to moderate exercise for hours. The desire to concentrate good of various kinds into the smallest possible space is one of the commonest of human wishes, but it is not encouraged by the broader economy of nature. In the exercise of the mind every teacher is well aware that time is an essential factor. It is necessary to live with a study of hundreds or thousands of hours before the mind can assimilate as much of the subject as it may need; and so it is necessary to live in exercise during a thousand hours of every year to make sure of the physical benefits. Even the fresh air itself requires time to renovate our blood. The fresh air cannot be concentrated; and to breathe the prodigious quantities of it which are needed for perfect energy we must be out in it frequently and long.

The inhabitants of great cities have recourse to gymnastics as a substitute for the sports of the country. These exercises have one advantage—they can be directed scientifically, so as to strengthen the limbs that need development; but no city gymnasium can offer the invigorating breezes of the mountain. We require not only exercise, but exposure—daily exposure to the health-giving inclemencies of the weather. The postman who brings my letters walks 8,000 miles a year, and enjoys the most perfect regularity of health. There are operatives in factories who go through quite as much bodily exertion, but they have not his fine condition. He is as merry as a lark, and announces himself every morning as a bearer of joyful tidings. What a postman did for necessity an old gentleman did as regularly, though more moderately, for the preservation of his health and faculties. He went out every day; and as he never consulted the weather, so he never had to consult the physicians. Nothing in the habits of Wordsworth—that model of excellent habits—can be better as an example to men of letters than his love of pedestrian excursions. Wherever he happened to be he explored the whole neighborhood on foot, looking into every nook and cranny of it—and not merely in the immediate neighborhood, but extended tracts of country; and in this way he met with much of his best material. Scott was both a pedestrian and an equestrian traveller, having often, as he tells us, walked thirty miles or ridden a hundred in those rich and beautiful districts which afterward proved to him such a mine of literary wealth. Goethe took a wild delight in all sorts of physical exercise—swimming in the Rhine by moonlight, skating with the merry little Weimar court on the Schwansee, riding about the country on horseback, and becoming at times quite outrageous in the rich exuberance of his energy. Alexander Humboldt was delicate in his youth, but the longing for great enterprises made him dread the hindrances of physical insufficiency, so he accustomed his body to exercise and fatigue, and prepared himself for those wonderful explorations which opened his great career. Here are intellectual lives which were forwarded in their special aims by habits of physical exercise; and, in an earlier age, have we not also the example of the greatest intellect of a great epoch, the astonishing Leonardo da Vinci, who took such a delight in horsemanship that, although, as Vasari tells us, poverty visited him often, he never could sell his horses or dismiss his grooms? The physical and intellectual lives are not incompatible. I may go further, and affirm that the physical activity of men eminent in literature has added abundance to their material and energy to their style; that the activity of scientific men has led them to innumerable discoveries; and that even the more sensitive and contemplated study of the fine arts has been carried to a higher perfection by artists who painted action in which they had had their part, or natural beauty which they had travelled far to see. Even philosophy itself owes much to mere physical courage and endurance. How much that is noblest in ancient thinking may be due to the hardy health of Socrates.—*From the Intellectual Life, by Philip Gilbert Hamerton.*

—There is a good deal of dissatisfaction in England, in regard to the exclusiveness of the Royal Yacht Club.

—This week in England, Mr. Mechi, the famous experimental agriculturalist, will open his farm for inspection.

—The reports of some very startling experiments are going the rounds of the European Press, in regard to the injection of warm cow's milk into the blood, for the cure of cholera.

—Infantile mortality in London amounts on an average to thirty-five per cent of all the children born. Under ten years of age thirty-five children die in the one hundred.

—Late English authorities have highly recommended the use of the American system of fog-whistles, as much superior to the old fashioned bell-ringing, or even the firing of cannons.

—How much heat can an animal stand? Dr. Wood of Philadelphia showed that a brain temperature of 114 degrees was fatal to cats, and that muscle coagulates between 108 and 115 degrees.

—St. Bartholomew is the oldest of the London hospitals. It was founded in 1123 by Rahere, prior of the Monastery of St. Bartholomew. To-day it has 650 beds, and administers relief to no less than 100,000 people.

—A learned Zurich Professor has just issued a work on Textile Fabrics, a large portion of which is devoted to the discovery of *shoddy* in cloth, by the use of the microscope. In society it can be found without the use of glasses.

Sportsmen's Goods.

INGERSOLL'S

LARGEST AND CHEAPEST

Boat and Oar Bazaar
IN THE WORLD.

159 South Street,

Near Fulton Market, E. R. New York.

Wooden Boats of all kinds and descriptions on hand and built to order. Sail, Whitehall Row Boats, Ship Boats, Steam Yachts, Cutters and Launches.

Diagonal Life Boat Steam Cutters and Launches, Single or Double Sculls or Sculling Boats, Four and Six Oared Shells, Gigs, Dingies, N. Y. Working Boats, Canoes, &c., &c.

Oars, Sculls, and Paddles made of thoroughly seasoned clear spruce, with spoon or straight blades, of the most approved pattern. Parties ordering Sculls or Oars will state whether they are to be round or square looms, if sculls; whether for open-hand, over-hand or cross-hand rowing, naming amount of over-lap of hands in inches; give extra length; distance from inner face of rowlock to end of handle, when the scull or oar is in position, and how finished.

We have the most Perfect Life Preservers in the Market.

1873. BOATING SEASON. 1873

WATERS' PATENT

—IMPROVED—

Paper Boats

FOR

RACING, EXERCISE, PLEASURE,
SHOOTING OR TRAVELING.

The inventors having during the past six months given their entire attention to their manufacture, will with this season, introduce our IMPROVED PAPER BOAT, in the construction of which great improvements have been made, overcoming all objectionable features which have been developed during the past six years. We refer with pleasure to the record of the past.

Our boats have been wintered and summered in both hot and cold climates, rowed in both fresh and salt water, yet after five, and in a few cases six seasons of steady use, these boats can be shown as serviceable to-day as when first finished. They were awarded the FIRST MEDAL AND DIPLOMA OF THE AMERICAN INSTITUTE, at its Fair held in New York in October, 1869, and for racing and training they are preferred to those of wood by numerous boat clubs and numbers of the best oarsmen throughout the United States, having since their introduction been rowed by the winners of THREE HUNDRED AND TWENTY NINE MATCHED RACES.

THE TWO SUCCESSFUL BOOKS OF
THE SEASON.

I.

Hallock's Fishing Tourist,

The Fishing Tourist, Angler's Guide and
Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association."
ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who
write a book mainly for the reason that they have some-
thing to write about—have something to tell the public
which the public desires to know. The shortest routes
to pleasure are laid down, and correct information is
given as to the best means of conveyance, the expense
of the trip, the secrets of the commissariat, etc. The
author has avoided the use of technical terms, and thus
made his volume all the more acceptable.—*Trav. Field
and Farm.*

II.

Prime's I Go A Fishing,

I Go A Fishing, by W. C. PRIME, author of "Boat Life
in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vig-
orous descriptions of scenery and character, is distin-
guished by a refined wit, a droll humor, a strong love
of the beauties of nature, and an enthusiastic devotion
to the piscatorial sport. This book will please all who
admire heartiness of style and exuberance of animal
spirits in their authors. There are some interesting
and well-told stories scattered through the volume,
which exhibits on almost every page the handiwork of
a man of graceful culture and wide reading.—*Boston
Daily Globe.*

Published by Harper & Bros., N. Y.

HARPER & BROTHERS, will send either of the
above works by mail, postage prepaid, to any part of
United States, on receipt of price.

The Trapper's Guide,

BY S. NEWHOUSE,

FIFTH EDITION.

A Book for the Trapper, Hunter
and Farmer.

IT TELLS

How to Trap all Fur-bearing animals.

How to Cure their skins,

How to live in the Woods.

How to build Boats, and catch Fish in the Winter

How to destroy the pests of the Farm and
Poultry Yard.

How to hunt Deer, Buffalo and other game.

IT GIVES

Narratives of the exploits and experience of
Trappers and Sportsmen, old and young.

It is a Book for Lovers of Woodcraft, for
Excursionists and for Boys.

An octavo volume of 216 pages, containing 32 full
page illustrations of animals, forest life, etc., and num-
erous woodcuts of Traps and Trappers' appliances.

Price, Bound in Cloth \$1.50.

FOREST AND STREAM.

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Co.,
103 FULTON STREET, NEW YORK.

Terms, Five Dollars A Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which, if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even *clamor* for it.

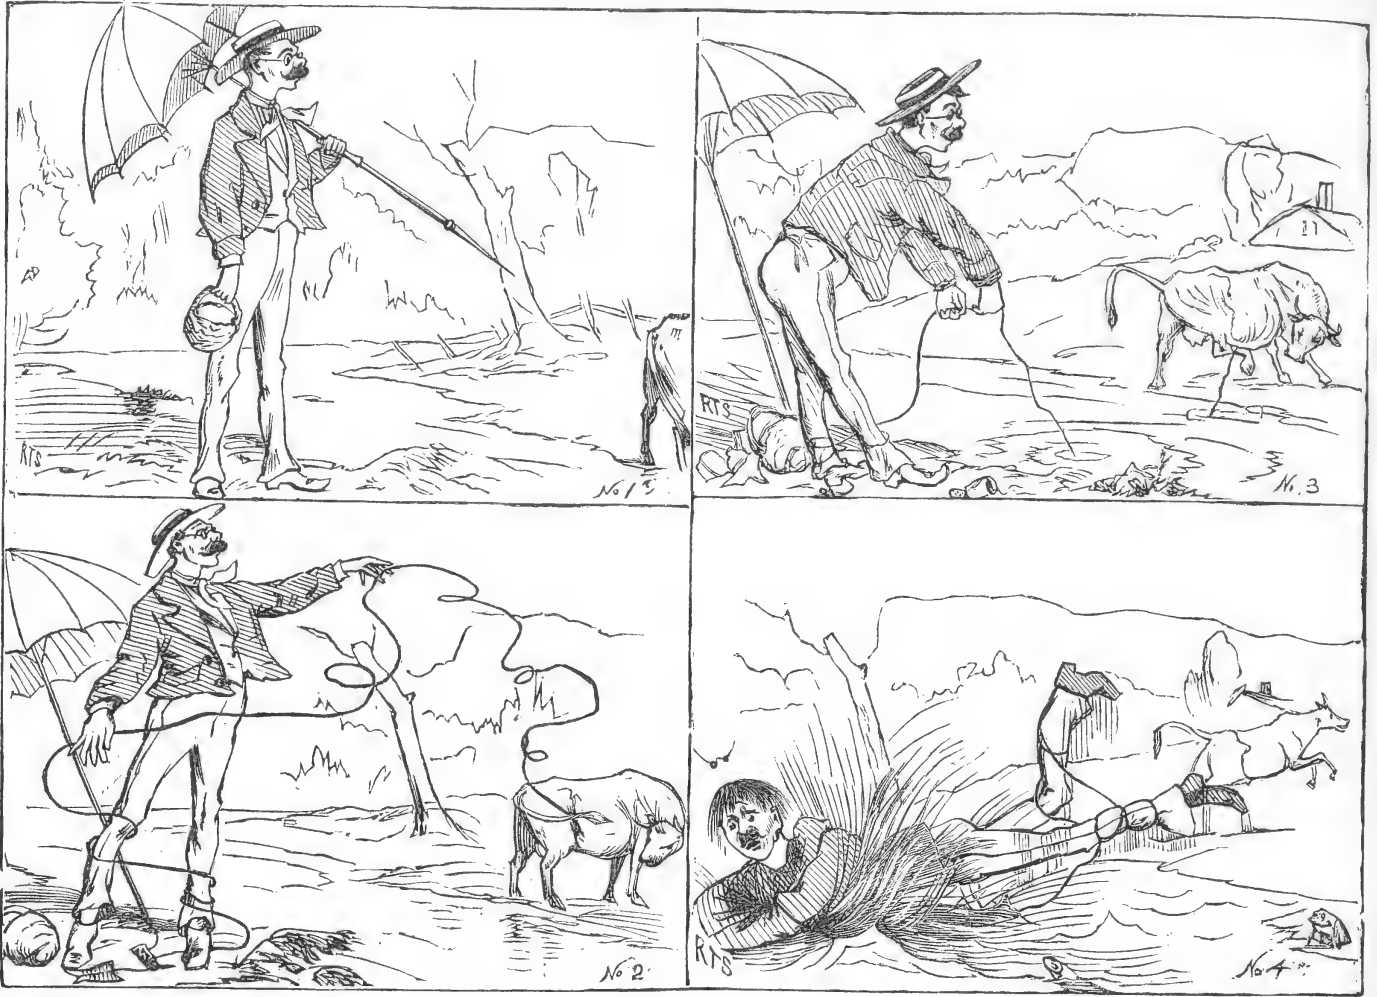

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with a single exception, have been identified with leading journals for years.

Mr. SIMEON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

CHARLES HALLOCK, Managing Editor.

ATTENTION! SPORTSMEN!

N. Y. State Sportsmen's
ASSOCIATION.

Report of Committee on Standard for Shot.

Your Committee have the following report to make on the adoption by shot manufacturers and sportsmen of a uniform "AMERICAN STANDARD" of Drop Shot.

We have corresponded with all the manufacturers in the country, and most of them express a willingness to conform to the standard which shall be promulgated by your Convention.

All manufacturers will have eventually to conform, when sportsmen require that their shot shall compare with the standard of excellence which your Committee has fixed.

Upon the most critical examination, your Committee have decided to adopt as the "AMERICAN STANDARD," the scale presented to us by Messrs. THOS. OTIS LE ROY & CO., of New York, as follows: (Here is given the scale, which can be had, on application, from Messrs. Thos. Otis Le Roy & Co., New York.) The number of pellets as given in the standard, is the correct number of PERFECT shot which will be produced by the given scale of each size.

For Forest and Stream.
THE PEACE COMMISSION—A PIUTE
PASTORAL.

IT was a peace Commissioner,
And his garb was sober drab;
His hair was long and white, and he
Economized his gab.
In short, he was a reticent
And inoffensive slab.

His style was philanthropic,
And he bore a carpet-bag,
In which he stored his tracts and soap,
And other peaceful swag,
Which Indians patronize when war
And cattle-stealing lag.

Long they sat in solemn council,
The agent and the Red,
Mildly talking flabby virtue;
Till the sachem shook his head,
As with doubt and dim suspicion—
Then he grunted low, and said,

Not with eloquence of nature,
Not in metaphoric style,
But in simple frontier lingo,
Mingled slang and grammar vile—
"Na-ree-trow-zis want some whiskey;
Injun empty; drink a pile."

Then that meek and lowly Quaker
Remonstrated with a tear;
Spoke of fire-water and ruin
With eloquence severe—
Said, quite feelingly, that whiskey
Was a foe most insincere.

Spake once more the child of Nature,
Keeping down his growing bile,
"Has my brother brought tobacco?
Is there powder in his pile?"
But the honest agent answered
With an unsuspecting smile:

"Had my variegated brother
Ever studied Mr. Trask,
He would never, I am certain,
Such a foolish question ask.
Read these pamphlets, they will teach you
In the light of truth to bask.

Powder I have none—nor whiskey,
Nor the brain-destroying leaf;
But of moral tracts and stories
I have many for the chief."
Then the Indian, weeping sadly,
Said it caused him bitter grief.

That his moral sense compelled him
To extract his brother's hair;
Which he did, with nice precision
And a sadness-stricken air;
And that hopeful Peace Commission
Terminated then and there.

J. J. R.

HOW THE INDIANS KILL TROUT.—The Grass Valley Union tells how the Lo family of digger persuasion destroy the brook trout. They wait until the season of the year when the streams run but little water, and when the fish collect in the deepest and widest holes in the stream. Then they cut off the water above such holes, and use soap root rubbed into a lather in the holes. The soda root soon causes all the fish in the hole to float on the surface of the water in a stupefied condition. Not one escapes. No wonder that while the rest of the world is endeavoring to increase the stock of fish in the streams, Nevada county is losing her fish."

—In Hawaii, if you carry a gun, you are likely to have a shot at wild turkeys on your way up or down. It is remarkable that many domestic animals easily become wild on the islands. There are wild goats, wild cats, wild chickens and turkeys; the cattle run wild; and on Hawaii one man at least has been killed and torn to pieces by wild dogs, which run in packs in some parts of the island.

ANTICOSTI.

THE JOURNAL OF A NAVAL OFFICER.

[Continued from our Last Issue.]

THE next morning we landed early about two miles inside of Pointe aux Pins, and sent the canoe back to bring on the baggage and follow us to Pointe au Grain, where we purposed breakfasting. The woods on this side of the bay were larger, rising gradually from the water's edge to some height, where they terminated in a large barren. Between Pointe aux Pins and Pointe au Grain, the next headland, a distance of three miles, we passed the ribs of two vessels high and dry on the shore. Near one was a good rope ladder, a couple of oars, and a ship's bucket. On reaching Pointe au Grain we found a direction board nailed to a tree near the beach. The inscription—"Five miles west to Provision Post"—was suggestive of shipwreck and suffering, the coast around Ellis Bay being formerly noted for the number of vessels lost there, of the truth of which we had seen but too recent proof. At the back of the Point is a large pond, almost enclosed by trees, and bordered with high rushes and water lilies, a favorite resort of duck at high tide and a most tempting looking spot. I shot two black ducks, and Flanigan declared he wounded one, which he said dived and hid itself in a little island covered with reeds. I think it much more probable that he missed altogether, as when shooting he gets immensely excited, and, like the Frenchman and the woodcock, provided he can obtain a good many shots killing his bird seems no object, and he cries "*Vive le sport.*"

For some distance to the east of Pointe au Grain extensive banks of limestone shingle, with occasional layers of thin slate, stretch inland; lying in long wave-like ridges, resembling one vast sea of stone, these banks remain a lasting memorial of the waters which once covered the face of the country. At eleven o'clock, there being no signs of the canoe, we lit a fire, and roasting the ducks prepared to make our first meal; a couple of flat stones served as plates, and two pointed pieces of stick as forks. We each carried a sheath knife, and, sitting down, in an incredible short space of time naught remained but feathers and a few well-picked bones. We now held a council of war as to our next steps, wishing to push on to Becscie river, fifteen miles distant, where there was good fishing, and leave the canoe to follow us as best it could. After many arguments on both sides, we determined to proceed, and left the Point at half past twelve o'clock. For the first six miles we got on very well, as by walking along the reefs, which lay in large flat slabs of limestone, now nearly dry, we managed to cut off the numerous indentations of the coast and keep from cape to cape. With the rise of the tide, however, we had to follow the beach, and soon began to find the difference. On we struggled over shingle, which, slipping at every footstep, made walking most laborious, and occasionally through long grass up to our waists, with fallen timber and other little stumbling blocks to ruffle our tempers. Flanigan complained bitterly at having started without a good meal, and, in a true soldier-like spirit, saying that "had he been on the line of march the orderly officer would have had a report long ago." Five o'clock came, and still on we toiled, heartily sorry at having left the canoe, as partly from hunger and partly from the heat of the day we began to feel rather done up. Now we were wading through streams up to our knees to cut off a corner, now plunging through weeds and brushwood, more than once feeling inclined to give up, but still holding on, knowing that our only chance lay in reaching the river before nightfall.

From the hurry we were in many points of interest no doubt escaped our observation, but we could not help noticing some of the more prominent features of the landscape. Low wooded spits of land and grassy points enclose innumerable ponds and lagoons, into most of which the tide flows, while picturesque creeks receive frequent small

but rapid streams, some of great beauty. One especially we could not help admiring, as, rushing down between banks of densely packed spruce, the stream formed a succession of tiny falls, over which the waters leaped and danced in glistening cascades. Here and there rich glades, covered with luxuriant grass, form park-like openings in the woods and relieve the eye, which is apt to grow tired of the perpetual vistas of spruce and pine. These rivulets, though too small to admit of trout, make up by the retreats they afford to wild fowl for any deficiency of the "finny tribe." With the rise of the tide flight after flight of black, blue-wing, and green-wing duck, shelldrake, *et id genus omne*, came in from the reefs and settled down upon the streams and ponds which border the coast. Often as we rounded some point and lit suddenly on a concealed lagoon we might have killed seven or eight birds in one shot, so closely together were they swimming in its waters, while by availing ourselves of the cover of the adjoining wood we might have enjoyed the prettiest flight-shooting possible. It was tantalizing to have to turn our backs upon what would have been magnificent sport, but as time was an object, and every additional weight told, we only killed two birds, so that in case it came to the worst, and we had to sleep on the road, we might have something to eat.

About six o'clock a direction board, with the inscription "Fifteen miles west to Provision Post," gladdened our eyes. If our information was correct we had now but five miles further to go, and we proceeded with fresh vigor. The evening soon closed in, and I was just thinking of hailing De Courcy, who was ahead, to debate a halt, cook a duck, and then push on, when a distant "halloo" from Flanigan attracted my attention. I waited until he came up, when he began a pitiful tale of his sufferings, and the following conversation ensued:—"Well, Flanigan, what's the matter?" "Shure, sir, I can't go another shtep." "Nonsense, come along, man." "Faix, ye can go along, but I'd rather lie down in the road and die." "Tut, man, we've only three or four miles further." "Begorra, I won't budge; why in the name of fortin did we lave the commissary this mornin', and we widout a blessed drop of tea or anything ilse?"—(this last viciously at me, as he had, with De Courcy, been opposed to leaving the canoe.) "Well, it was a mistake, I'll admit, Flanigan; but cheer up and let's get on." "It was a sorry day I left Quebec; faix, if I reach there alive agin it won't be in these thom-foolin' expeditions ye'll ketch me."

Having delivered himself of this very uncomplimentary allusion to our trip, and evidently appeased at having administered a rebuke to me for abandoning the "commissary," Flanigan condescended to get up from the beach where he had been sitting during the above dialogue, and we jogged along for another half hour, when a shout from De Courcy broke on our ears. In the gloom of the evening we could indistinctly follow the outlines of the coast, which appeared to bend inland, and I was in hope that De Courcy had reached the river, when the loud baying of a dog rang through the air. Never had dog's bark sounded so sweetly before. We now knew we were safe, and pressing on soon found ourselves confronted by De Courcy and a man, who led the way up a small bank to his house. We learned that where we had set out this morning the distance was twenty-one miles, but as we had been following up duck during the forenoon, and going inland, we could not have walked less than twenty-seven or twenty-eight. It was the hardest day's work I ever had, as the roads were atrocious, and made the distance quite equal to thirty-five or forty miles, while of course travelling on empty stomachs added to our difficulties.

On looking round after supper we failed to perceive more than one room (that we were in), which opened into a small store-house, just large enough to admit of a cooking stove, a barrel of drinking water, and a few shelves containing crockery. As the apartment in question was about twelve feet square by eight feet high, we watched with wonder and no little dismay the preparations being made for our sleeping. Our hostess, a portly dame of sixteen stone,

made up a kind of bed on the floor, and then, first scrupulously shutting the door and window, about half past nine o'clock, set us the example to retire by bundling into bed, clothes and all. Their son, a boy fifteen years of age, next sprang nimbly into a small crib beside the paternal four-poster, or rather what answered for one. Then De Courcy and self slipped under our scanty sheet and rug, and next the husband, who, owing to our bed place being at one side of his, had to scramble up over the bottom rails, and lastly Flanigan took up his berth in a straight-backed chair, and resting his heels on the top of the stove (where a fire had been lit in our honor), prepared to make himself comfortable for the night. It was a close pack, and likely to be a hot one, the whole scene reminding one forcibly of a "Pull-man" sleeping car, where protruding above the curtain you may see a hand hanging, then a skirt, then a petticoat, and so on *ad infinitum*, the only difference being that in our case there was no curtain, and it constantly required a good deal of careful manœuvring on our parts to divest ourselves of our nether habiliments without shocking the good lady's sense of propriety. However, at last that was *un fait accompli*, and being thoroughly tired we soon dropped off to sleep, confused ideas of shipwrecked sailors, half-starved mariners, and other strange fancies running in our heads.

On waking next morning about eight o'clock we found the rest of the family up and dressed. Luckily M. Gamache and his wife, probably not so tired as we were, had awoke early and dressed while we slept; otherwise, had we all "come to" about the same hour, the consequences would have been awkward to say the least. The baking we had undergone during the night prevented us feeling as fresh as we should have done after our long rest, but a dip in the river, 200 yards above the house, where there was a deep pool, soon set us to rights. Beesie river, so called from the number of shell drakes formerly found here (*beesie* being the French name for that bird), would perhaps be better described as a stream, since, though extending some distance inland, the width only averages from twenty to thirty feet, and the depth one foot, save in pools and stretches of "dead" water, where there is from three to eighteen feet. It has its source in a small lake sixteen miles to the northeast, and for the first ten miles the bed of the river is nearly dry. As it approaches the sea, however, it is fed by numerous small tributaries, which so increase the supply of water that the current during the last few miles is extremely rapid, and, as we found, very difficult to stem in a canoe. The channel is altogether stone, in some places large slabs of limestone, but for the most part shingle and small rough stones, forming frequent rapids some over one mile in length, with a depth of water of six or seven inches. The land it passes through is low and thickly wooded, the timber sloping down to the water's edge, and after winding in a succession of picturesque bends the river enters the sea at the head of a small inlet, about 400 yards wide by 200 deep. On a narrow clearing on the right bank, where the land is somewhat higher, and overlooking the river, stands the "cabin" we now found ourselves in. The small window sashes, heavy rafters, with here and there a bolt protruding, and planks studded with many a nail, indicate the origin of its construction, which a glance at the paper pasted over the walls (sheets from an old "log" book) confirms. Built forty years ago from the wreck of a brig cast away near the mouth of the river, it has been successively occupied by trappers engaged in hunting otter and marten in the woods bordering the neighboring streams. Its present proprietor, Absalom Gamache, is the only surviving son of Gamache of Ellis Bay notoriety. He is a middle-aged man, rather above the average height, but with an habitual stoop, which makes him appear shorter than he really is. Small, piercing grey eyes, deeply set under shaggy eyebrows, and half hidden by long rusty black hair, which hangs in tufts over his forehead and blows in wild clusters round his ears and neck, give a weird expression to a thin angular face, tanned by constant exposure to every kind of weather and scanty ablutions to a dirty brown—such is the picture of a man who, in his younger days, was a wild character, inheriting from his father a total absence of fear and disregard of life, either of his own or that of any other human being who thwarted his wishes. From all accounts the Gamache family were an awkward one to have dealings with, ugly stories being told of shipwrecked sailors who with their vessels had been cast ashore, but who, on the principle that "dead men tell no tales," had been quietly disposed of while some member of the family appropriated whatever the ship contained. Our friend Absalom does not appear to have entertained any great regard for his worthy sire, as a few years ago, when on a fishing trip, he told Hamilton (our boatman) that "he would not die happy unless he got a shot at the ole man." His father, to whom he thus jocularly alluded, however, no doubt out of spite, killed himself in a drinking bout, and so saved his affectionate son the trouble, though history does not tell whether the disappointment has preyed deeply on the latter's mind. In the afternoon we walked up to the lower salmon pool, 200 yards from the mouth of the stream. The water there, as indeed we found throughout the island, is of a rich brown color, but with a peculiar golden shade, which gives it wonderful transparency, so that had there been salmon in the pool we could hardly have escaped seeing them. We failed, however, to find any trace either of salmon or trout, and resolved next morning to try our luck at the upper pool, between three and four miles higher up. As we did not care for a repetition of the previous night's sleeping arrangements, we had a tent, rigged up with sails from Gamache's boats, made on the beach, and as we still felt the effects of our tramp turned in early and slept well.

On getting up about six o'clock we were glad to find the Indians had arrived, having been prevented by the heavy sea from pushing on yesterday. They had been employed in the forenoon in putting on strips of canvas and generally patching the bottom of the canoe, which had been a good deal rubbed from contact with the sharp reefs. About twelve o'clock I started with Gamache for the river, leaving De Courcy and Flanigan to await the afternoon tide when they purposed crossing the bay in search of duck. Skirting the right bank of the stream for a few hundred yards we then strack into the woods and followed a rough, tortuous path, cleared by Gamache for trapping purposes. From this main path several smaller ones branch off in different directions, and at irregular distances we passed marten traps, which were being put in working order for the coming winter. Otter and marten were formerly very plentiful in these woods, but some ten years ago a party from the main land, not content with legitimate trapping, spread a quantity of poison on the ground. They reaped but scanty benefit themselves, as but one-third of the animals that were killed were ever found, but when the snow cleared away in the following spring hundreds of skeletons of foxes, otter, marten, and even bear, were found throughout the island. The poison, though originally confined to a comparatively small tract, had been carried far and wide by the unfortunate animals in their wanderings, and as they died the beasts that preyed upon their tainted carcasses in their turn fell victims to the foul scourge. The fur-bearing animals had been well nigh exterminated, and it is only within the last year or two that, thanks to protective measures (which offer a reward for information that will lead to the conviction, and inflict a heavy fine on the culprit guilty of such a dastardly act) their increasing numbers show that they are beginning to recover from the almost fatal shock they sustained. Nearly all the trapping is done when the snow is on the ground, and though Gamache's snares are spread over a wide district, some twenty miles long by six or seven in width, if he captures half a dozen marten and nine or ten otter during the season he considers himself lucky.

Following our rugged pathway, which lies now deep in the recesses of the wood, where so thickly grow the spruces that the sun's chary rays can with difficulty penetrate the overarching and tangled boughs, and where our axes are frequently required to cut away the windfalls, which block up and sometimes totally conceal the path, now emerging in a larger and clearer growth of timber, where the foliage of the white and black birch and the ash forms a pleasing variety to the dark green of the never-changing spruce. Here the ground is bright with the scarlet of the "pigeon berry" (*Cornus Canadensis*) and the snow white fruit of the "maidenhair" plant (*Capillaria*), while amongst other vegetation we observe the "cow cabbage" (*Clintonia Borealis*), with clusters of bluish-purple berries and "Solomon's seal" (*Streptopus Rosinus*), with its luscious red pendulent fruit. Black and red currants, raspberries, and in the grassy openings strawberries, grow in wildest profusion, and while here I may remark that in wild fruit and edible berries *Anticosti* appears prolific. Of the former we saw quantities of raspberry and strawberry plants, and though the fruit was now nearly all gone the little that remained was in flavor fully equal to that of the garden. Red and black currants, too, were abundant. Of the latter there are two varieties—one similar to the garden berry, the other covered with prickles and slightly bitter to the taste. Besides the above, high bush cranberries (*Viburnum Opulus*), with red, cherry-like fruit, grew in great profusion on the river banks, while on the low grassy bottoms skirting the beach strips two or three hundred yards in length were covered with gooseberry bushes. The low cranberry we did not come across, though I believe on the peaty ground further south it is found in large numbers. Of berries the principal was the "maidenhair" in the woods and the "squash" in the barrens, both of which make delicious preserves, the former selling in Gaspé for fifty cents a gallon.

Anon the circuitous winding of the path brings us to a bank overlooking the river, which flows in a rapid, foam-flecked stream some thirty feet below, and whose ripple sounds sweet and refreshing after the utter solitude of the woods we have just traversed. Fording the river we strike a path on the opposite bank, and a few hundred yards further up lies the salmon hole. In shape it is somewhat similar to a basin, the depth in the centre being eighteen to twenty feet, gradually shoaling towards the edges, and the length about thirty yards by twenty-five in the widest part. A few years ago the pool was seined, and roots, rocks, driftwood and other obstacles underlying the banks, and which would have torn a seine, have all been removed, so that now there is nothing that can possibly foul one's line. Though the trees and shrubs fringe the bank on either side, and render fly fishing impossible a small gravel bank at the foot of the pool serves both as a good casting spot, and, dividing the stream into two narrow channels, with a depth of water of from one to three feet, lessens the chances of fish escaping in that direction. Above the hole the river sweeps suddenly to the right, and forms a succession of long rapids and quiet pools, the latter well stocked with trout. Peering cautiously through the alder bushes on the left bank we saw that which made our hearts throb and sent the blood coursing riotously through our veins, for there, with head up stream, and underlying the current, which whirls in circling eddies far overhead, lay some fifteen or twenty dark-colored bodies, scarcely distinguishable from the ground on which they rest. Presently something shoots from out the apparently inanimate mass, and there under the opposing bank the water breaks and a mo-

mentary gleam of his silver livery marks the leap of a noble salmon. Peter is delighted beyond measure, but determined not to appear too sanguine to my "Well, Peter, any luck to-day, think you?" replies with a laconic "mebbe." The bright flash of his eye, and the flush that mantles his sallow cheek, shows that he anticipates a good day's sport, and hastily putting my rod together, and tying on a large dullish fly, I cast near the head of the pool.

To detail the anxiety with which my eye followed every motion of the fly, as now dropping it into the eddying current, now throwing it under either bank, now allowing it to trail lightly on the surface, would be tedious; suffice it that for nearly an hour I whipped the hole without a rise, or any token that might lead me to infer that it contained salmon. However, we had ocular proof that the fish were there, so substituting a small gaudy fly I threw it just above the spot where they lay. The effect was marvellous. Hardly had it touched the water ere I had a rise. In my eagerness I was too quick, and missed striking. Another cast followed by another rise, and again the fish escapes. Bad angling this, and so it is, and has excited the indignation of the Indian, for he whispers in a voice which ill-conceals his vexation, "Me tink you too much hurry." Quite right, Peter, there lies the secret. So steadying my nerves and waiting a few minutes I try another cast. Bah! I have frightened them, and my friend is not to be taken in again think I, in disgust, as the fly unnoticed floats down stream. No, by Jove! there he is at it again. Now he seizes it! Wait yet a moment. See, he has discovered his mistake, and is about to turn and be off. Now's your time; strike quick and sharp; and the next instant the strain on the rod and the merry click of the reel as the line slips rapidly off assures me of success so far. Thirty yards have run off my reel, and as he nears the head of the pool and there seems to be no diminution of the speed with which the line still continues to unwind, I thought he was about to make for the rapids. Luckily he did not, for though the water is shoal my line must have infallibly been parted on one of the numerous rocks and roots, and then good-bye to salmon for that day. This time, however, he preferred sticking to the pool, and turning at its head the line suddenly slackens and with a spring of three or four feet the salmon launches itself in the air. I have only time to note the play of the sunlight on his silvery body when, with a downward plunge, he again starts off with a bolt that makes me tremble for my gear. No fear of its failing, though. The rod is a veteran, and belongs to one of the best fishermen in Nova Scotia, who has killed his hundreds on it, and my tackle is all chosen by the same kind friend from the famous stores of Mrs. O'Connell, of Halifax notoriety.

Now he makes the circuit of the pool, and as he approaches my right hand is busily employed in reeling up the slack line, so as to maintain an even strain. Ah! he is heading for the narrow channel by the gravel bank. "Hi! Peter, look alive there, and frighten him back." No need to sing out so loudly, for Peter is on the *qui vive*, and the apparition that, with arms distended and brandishing a formidable looking gaff, stands in mid stream and bars the passage is enough to cause the most courageous of the finny tribe to shrink back in dread and pause ere he attempts to force a path in that direction. So thinks this salmon; but confound it there he is darting straight for the spot where his brethren lie, and with another spring right over them he proclaims his intention to warn them if possible of his impending fate. This will never do. I shan't get another rise, even if I succeed in landing my friend, if he continues in this playful mood much longer; so putting a little extra strain on the rod as he again nears me I give him the but handsomely, and endeavor to bring him into shoal water on the slope of the gravel bank, where Peter stands ready with the gaff. The rod bends almost double, and as it won't stand the increasing pressure, and the fish is evidently but half tired, I am reluctantly obliged to let him take line, and he leads me another dance round the pool. At last I wear him out, and as he swims exhausted near the surface I gradually bring him in shore, and, giving him the but till his sides show on a level with the water, Peter strikes him well behind the shoulder, and the next instant lands high and dry on the beach the beautiful creature that for the past forty-five minutes has been affording me so much excitement. He had been well hooked right behind the gills, and could only have escaped by a miracle.

Gamache meanwhile had not been idle, having with the aid of a sapling cut on the bank, a whipcord and a fly borrowed from my hook, pulled out some three dozen trout, ranging from a few ounces to upwards of one pound in weight. As certain inward misgivings warn us it must be near luncheon time, and as it will do no harm to give the salmon hole a little rest, we light a fire on the shore, concealed from the pool by a bend of the river, and splitting half a dozen of the largest trout down the belly, after cleaning, washing and sprinkling with pepper and salt, we proceed to cook them in approved sportsman fashion. Splitting pieces of green willow, which grows conveniently near, to within a few inches of the bottom, we place the trout, first kept in a flat position by thin skewers of wood, in the fissures thus formed, and tying up the heads of the sticks with a bit of string or grass, drove them in the ground round the fire, which should be allowed to kindle thoroughly till the embers are red hot and emit but little flame. With an occasional turn of the sticks, in less than ten minutes the trout are done to a nicety, and cooked in this primitive manner taste better than when served up with all the ingenuity and artistic devices of a *chef de cuisine*. A hard biscuit and a draught of the deliciously cool water that flows in a crystal stream at our feet, complete our

lunch, and leaving our impromptu camp we turn our steps towards the salmon hole. Half a dozen casts and I am well into a large-sized fish, which, after a lively struggle of twenty-seven minutes, Peter lands on the bank. With my next salmon, a large fellow of not less than twenty pounds, I am not so fortunate, as after playing him ten minutes he bolted for the rapids, and with a tremendous leap threw the fly out of his mouth and escaped. As the sun was sinking behind the woods, and long shadows fell athwart the pool, I killed a fish of about ten pounds, and after this, as they did not seem to rise, I put my rod up, and shortly after five o'clock started for camp, which we reached about six o'clock. De Courcy had not been very successful, his bag consisting of only five duck. In weighing the salmon we found them to run fifteen, thirteen, and nine and a half pounds respectively, and cleaning the largest we gave a portion to the Indians and also to Gamache, and had the remainder cooked for dinner. It proved a most acceptable change in our diet, and with some of Madame Gamache's rolls (which, with all respect for Flanigan, I infinitely prefer to his "Chupatties"), and a black duck to wind up with, we dined on galore. It was a bitterly cold night, and, as bad luck would have it, the wind blew straight into our camp, half suffocating us with the smoke from the fire in front. However, it had one good effect, that of banishing the mosquitoes which usually persecuted us half the night, and turning in about nine o'clock we were soon oblivious of the dense black smoke that whisked and whirled with every fresh gust of wind around the interior of our domicile.

LIEUT. W. HUTCHESON POE, R. M. L. I.

[To be Continued.]

Long Island Sound Reminiscences.

SHARK FISHING.

REM. NO. 1.

IT is seldom that this miserable fish is sought for by the genteel fisherman, though he can yield some good sport. Forty years ago several jolly good friends of Eli Kimberley formerly keeper of Faulkner's island made their annual visit to the genial old man, on a week's cruise during the month of July. At the close of every trip they invariably had a shark frolic. Uncle Eli kept the requisite gear, such as swivel chain, hooks bent on good new warp, harpoons, spades, knives; with moss bunker bait, waifs, &c., and thus equipped, they started for the shark reef, which lies west of Goose island, in about six fathom of water. They generally had three sets of gear, and waited about one hundred rods apart, on or just before highwater slack, always selecting a calm, quiet time. Hook on the bottom and four old fogies telling yarns, waiting events, over the lunch, and choice old Grenada rum, which in those days was as pure and smooth as oil. It was a scene worthy the brush of a painter, and your humble servant, now the only survivor of that party, can fancy he hears the shout of that good old soul, Uncle Ely, "there goes the waif," Whirrah! Whirrah!! "Clear up decks," "Never mind lunch," "There she goes!" "There she watches!" "Man your oars," "Head boat," "So—so—steady—way enough." As the old man grabbed the waif and fetched it up, we gave two good yanks in order to make a sure hook of it, and cried "Take the helm and steer as I tell you"—"turn ship," Whirrah! as the yawl boat cut through the water for about a half mile, when the shark made for the surface, changed his course and started in shore. But the old man kept a taut line, and finding him a little easy on the bit hauled in for a sight. "Nine foot by Jingo," as the shark lifted his tail and turned again. "Hard a starboard," the old man cried, "and we'll beach him!" But it was no go. The shark was mad; the line soon became slack; the shark sighted right under the boat, the whole crew expecting a tail stroke, but were breathing free again as he shot off a-beam on a nine knot tansion, till the better end of the warp as he turned, was in the skipper's hands, who placed the line in the scull hole and hauled in hand over hand. The fish was coming head to and evidently bent on mischief. "Stand by your lance." "One of you take the harpoon—" "I see him—he's coming for the stern, and by jingo, he'll board us!" but it was too late. Lances and harpoon in the excitement were knocked overboard, and the position we held brought the boat's stern level with the water, and the fish had good way on him and landed fore and aft in the boat, mouth wide open as he slid between the old man's legs, smashing things, like a mad bull in a china store. Two of us jumped overboard as the fish came in. "Kill him! strike his nose!" "by jingo, he'll swamp us," cried the old man. The tiller was the only weapon for us, and with a few taps on the nose he was stilled. The result—two broken thwarts, the ceiling knocked out in two places, linnch and old Grenada ground to pumice. Oars, lances, and bait-dish overboard, one broken finger, boat full of water and shark, hat-bailing in order, the two men overboard—and all hands fully satisfied with that closing scene. The shark measured nine feet six inches, and a madder subject never came into any society than he.

OLD SALT.

—There is a lobster farm in Maine, where 40,000 lobsters were placed last year. This spring 140,000 male lobsters were taken from the pond and sold. About this period millions of little lobsters must be crawling round.

—Twenty bags of potatoes will overstock the Honolulu market.

THE U. S. GEOLOGICAL SURVEY.

Prof. G. H. Batty, ornithologist of the United States geological survey, sends the following letter to FOREST AND STREAM. It will be perceived that he has made some valuable scientific discoveries. This letter was received a day too late for publication in our last number, but its contents are new and none the less interesting. [Ed. F. and S.]

TWIN LAKES, Colorado Ter., August 1st, 1873.

DEAR SIR:

Dr. Hayden's geological surveying party has worked the country up thoroughly from Denver to the Buffalo Peaks. The main party is separated into five divisions. The photographers' party travel all over this section of the country where there are good views to be had, but the other divisions have each a section of the country to go over and complete by the 1st of October, and thus the parties will be separated from each other until they all meet at the depot camp at Denver at the close of the season. The party to which I am attached is in charge of Mr. Gannet from Bath, Maine. We have visited a great many of the highest peaks of the Rocky mountains, on which I have collected a great many rare and interesting birds and animals. Of birds, I have taken about three hundred, representing one hundred and fifteen species. The rarest of birds taken are *Lagopus leucurus*, (white tailed Ptarmigan,) and young, *Tetrao obscurus*, (dusky grouse,) and young, *Picicorvus columbianus*, (Clark's crow, or nutcracker,) *Hydrobattu Mexicanus*, (water ouzel), *Cyanocitta Woodhousei*, (Woodhouse's jay,) *Argialitis montanus*, mountain plover, *Salpinctes obsoletus*, (rock wren), &c., &c., &c. I have also taken the nest, eggs and young of the *Regulus calendula*, (ruby-crowned wren), which has never been taken before. Of animals I have collected the black-tail deer, (mule ear), lynx, Rocky Mountain hare, tailless rabbit or coney, marmots, porcupine, gophers, prairie dogs, &c., &c. The tailless rabbit is the rarest of the animals taken and is only found in the highest peaks of the Rocky Mountains, far above the timber line, near the perpetual snow banks where there is but little vegetation; in fact where they are most numerous there is nothing to be seen but immense piles of volcanic rocks, which the coneys are greatly attached to. In these piles of rocks the faint squeak of the coney may be heard as he suddenly appears from a hole in rocks, and with a sudden jerk of the head gives his note, a single squeak, and immediately returns to his retreat in the rocks, only to reappear in an instant and give his feeble squeak as before. The following are the measurements taken of the coneys collected on Mt. Lincoln, Colorado Territory, July 10, 1873: length from nose to end of tail, eight inches; length of head, two inches; breadth of do. one and a quarter inches; color, gray, inclined to mouse color on the hind parts. Panthers, elk, mountain sheep, (big horns), antelope, black, cinnamon and grizzly bears are not uncommon in Western Colorado. One of our party, J. T. Gardner, met with two old grizzlies and a cub on the summit of a mountain a few days ago, and succeeded in badly wounding one of the old bears, and if he had followed the bear down the mountain he would probably have killed it. Mr. Gardner killed one of the largest grizzly bears ever taken in this section of the country last summer. The grizzly bear is the master of all animals in the mountains, and can easily pull down and destroy a mule or horse with but little exertion. During the hot weather, the grizzlies retire to the highest peaks of the mountains, far above the timber line, where one would think so large an animal could not subsist, but there are thousands of grasshoppers, and an abundance of vegetable matter that furnish ample food for the bears. Bears delight in rolling in the snow banks, and are always found near them in the fore part of the summer, but when berries are ripe, they resort to the valleys and streams in search of their favorite food, the wild cherries. It is generally supposed that the grizzly bear will attack a man, but this is not correct. If a man be wounded he will attack his assailant at once, if hard pressed; but nine times out of ten a grizzly will run when shouted at, as they stand in great fear of the human voice. I am positive of this, as it has been tried on several occasions by members of our party. The mountain sheep are only found on the higher mountains during the summer, but when the cold weather comes, they gradually descend to the valleys to feed, and the greater body of them winter in the foothills. I have heard it stated that a mountain sheep would leap down a rugged mountain fifty or sixty feet, and striking on its horns, regain its balance, and would go down a mountain in this manner by a succession of leaps, until it had escaped the hunter. When a big-horn sheep is descending a mountain by jumping from one rock to another, it strikes on its feet and not on its head. When in motion, the sheep carry the head very low, and when jumping alight stiff-legged, and at a distance appear to strike the head against the rocks. A few days ago I drove one off a cliff partly covered with snow so I could have a good opportunity to observe its movements, and was rewarded for my trouble by seeing it run a distance of half a mile over a very rugged mountain side in a very short time. By following its trail I saw at once the secret of its long leaps, as it slid from six to ten feet at every leap, with its hoofs spread to their fullest extent to check the force of its headlong retreat. The elk feed on the high grassy mountains, above timber line, in bands, in this country, but in the Yellowstone and Snake river country where they are more numerous than here they are found scattered all over the country in small bands in the summer, and in the fall they collect in large bands of from fifty to two hundred, and when shot at from several points at once become confused and bewildered and run from place to place in a confused manner, and at such times they may be shot down like cattle.

Mr. Batty adds: "Please excuse the manuscript as I am writing by the light of a camp-fire, and have to jump up and kick the charred logs every five minutes to make them blaze and give me what is at best a poor light." That is what the patrons of FOREST AND STREAM would call "roughing it in the bush."

—The Hawaiians are dying out. In 1832, the island had a population of 130,315 souls, in 1860 it was only 62,959. The decrease has been over sixty per cent in forty years. Mr. Nordhoff thinks if the islanders went back to old customs as to dress, that is to no dress at all, their health would improve. He says in fact, that pantaloons, shirt collars and stockings have been the death of them.

SNIPES SHOOTING IN VIRGINNIA.

HOG ISLAND, VA., August 23rd, 1873.

EDITOR FOREST AND STREAM:

The precise locality from whence I date my letter, is not I think very well known, I therefore trust such information as I may give may be of interest to your readers. How to get to Hog Island, is I suppose first in order. From New York I took the Norfolk steamer. On board I met several fellow sportsmen, bent on the same errand as myself, to shoot bay snipe and curlew, intending to make Chincoteague and Mockhorn Islands the center of their operations. All these islands are situated within a few miles of one another, lying near Capes Henry and Charles. Arrived at Norfolk, I took steamer to Cherry Stone, some sixty-five miles distant. At Cherry Stone I hired a small fishing smack to carry me to Hog Island. I happened to get a good boat and a fair breeze, and a pleasant sail of two hours landed me on the island. On the way I had a chance to try my Snider Allen, on a flock of curlew flying near the boat, and killed eight birds. Hog Island is not a paradise, though old Jake may be the colored Adam. The island is a sandy waste, with a few sand dunes, and some occasional trees, rugged specimens of the red cedar. Jake, the landlord of the locality, has a rough shanty, and makes you welcome, for the reasonable price of one \$1.50 per diem, throwing in his valuable services for the money. I had provided myself against all contingencies, by laying in a stock of bread and ham, and after having arranged my baggage for the night, I turned in early, in order to be up the next morning before the dawn. Long before day-break, Jake had me out. Though an ardent sportsman, Jake's imitative faculty as far as the manufacture of decoys went was not pre-eminent, therefore our stool-birds were of the most peculiar ornithological character, though Jake said they would do. From his manner I thought he had some surprise in reserve. After a bite of bread and ham we took to the beach, and about a mile from the shanty we commenced digging our blind. The stools Jake planted quite artistically about twenty-five yards from our blind; then Jake chuckled as he drew from his pocket no less than three live willets and two marlins, which he declared were well "educated birds." These he had tethered with a bit of leather and a piece of string and they were packed among the wooden shams. Now Jake showed himself a master of his art, and piped the willet's cry with a skill which was inimitable. The tide now was rising rapidly, and the decoys fluttered and whistled away. Soon in the distance loomed a flock of willets. Coming strong with the wind they overshot the decoys, but flew low enough for me to let them have both barrels; then returned undismayed, apparently recalled by the cries of some of the winged birds. "Let 'em have it agin, Massa," said Jake, and so I did. These four shots gave me some thirty birds. The wind then became so fresh, piling in the sea so far on the beach, that we had to pick up the decoys and make another screen further inland. Again came the willets, and by ten o'clock I had bagged eighty-six snipe. The shooting then ceased for the day, ebb-tide putting an end to the sport. Next day I tried the curlew on the other side of the island. This time Jake's stools, if not perfect as to form, were better as to color, having been fresh painted. Jake again gave me the benefit of his acquaintance with the curlew, using a bandana handkerchief tied to a stick which he waved to and fro, attracting the birds. I had seen this particular dodge tried before, but never with the same success. I shot for about three hours, killing some thirty-two birds. They weighed on an average one and one-half pounds each and the longest bill measured precisely twelve and one-half inches. On the third day I varied my sport by spearing sea-eels. I must confess that my first experience was an unfortunate one, as I fell overboard from the boat, in my eagerness to kill my prey. But gaining courage and address, after having speared a bushel basket full of eels I had enough of it. Sincerely yours,

C. B.

P. S.—Having lost my pen I write this with a bill of a curlew. I softened it first with vinegar, then split and nibbed it nicely, and it makes quite a good *stylus*. Jake is a master in cooking snipe and curlew, and has a stock of excellent Southern red pepper, but if any of your friends have the least bit of gourmandism about them, tell them not to forget the lemons, the juice of which enchances the flavor of these birds.

—At the sale of the Perkins collection in London last month, a vellum copy of the Masarin bible fetched £3,400, and the first Shakspeare folio £585.

—About £225 is the price asked for the privilege of shooting over a Scotch grouse preserve of about 15,000 acres. Six persons are allowed to shoot, each to pay the above price.

—In the United States in 1871, we used the wool from 32,000,000 of sheep, or about 128,000,000 of pounds. About 17,000,000 more of sheep would make us independent of all other countries as to wool.

—The salmon season in Oregon, has yielded an enormous catch this year. It is safe to say that this fish alone, has swelled the imports of Oregon over 1,000,000 more than they would otherwise have been.

See how readily the Chinese take to the manners and customs of civilization. Two of them fought a duel in Arkansas the other day, and one was killed.

For Forest and Stream.

TROPICAL HUNTING SCENES.

GRAND are the woods, and clear the bubbling streams
In Asiatic realms, where Ganges sweeps
Thro' green savannahs and embowering groves,
Until it mingles with the Bengal tides.
Behold, far down the mountain slopes,
Beneath the realm of snow, the spreading woods
Rustling their foliage of eternal green.
The teak tree, the brown chestnut and the oak,
Kissed by the sunset, glow like golden crowns,
While the black hemlock and the spiring pine
Thrust up their spear-like points and pennoned shafts
Like hosts embattled. Far beyond, the plains
Of verdurous Thibet spread their level floor.
Enchanting pictures of serenest bloom
Burst on the vision; oranges in groves,
Citrons and yellow lemons, glow like gold;
The ripe pomegranate droops its juicy fruit,
Red cherries hang their clusters o'er the trees,
Luxuriant mangoes swing their ruddy globes,
While strawberries paint with crimson all the ground.
Green, gadding vines their tendrils interweave,
And loftiest trees with flowery festoons drape:
Peacocks display their gaudy plumes around,
And birds of paradise their mottled dyes.
And here the royal tiger of the wild
Ranges supreme and guards his noonday haunt.
And in the glooms of night devours his prey.
The gun deer and the brindled antelope
Tremble in bosky coverts, or at speed
Stretch forth in flight across the open plain.
'Tis a fair scene, where gently peace drops down,
Folds like a bird her pinions on her breast,
And all the glimmering shades at twilight's hour
Their silvery veils and vapors interweave.

Fair, flowery scenes o'er Afric's mystic land
Since the creation morn have bloom'd and smil'd
In lavish beauty. All the varied forms
Of Nature, fresh from the Creator's hand,
Are here commingled in transcendent pomp;
Soft plain and placid stream, and mountain range.
Here glows the fruitful plain, or frowns the waste.
Here flow majestic rivers to the sea,
Or spread the limpid lakes their glassy sheets
Vast lakes whose marge by savage herds is trod,
Whose waves are only crossed by frail canoe,
Or haunted by the screaming waterfowl.
Here desert moors extend their arid space,
Here mountains soar in grandeur to the skies,
Forests immense, illimitable spread,
Fair, flowering groves and natural gardens bloom.

Th' exploring stranger from remotest lands
Crossing these waters drops the listless oar
To view the wondrous scene. Far, far extends
The reedy shore with endless meadows hemm'd,
Or fring'd with woods of tamerind and palm;
Charm'd with the view, Eden-like, his soul
Drinks in the entrancing splendor of the scene.

Far spread the shores, now rough with beetling cliffs,
Now smooth with waving grass and unknown shrubs;
Far stretch the lakes, undimped in their sheets,
While far in distance float the mountains blue.
Here a white sand-beach spreads its shelly road,
Back'd by the cocoa-palm trees and the huts
Of villages in green plantations hid.
Above some granite bluff the eagle swings,
And fish-hawks clamor, and in groves around,
Where the oil-palms their yellow nuts display,
Cooes the green pigeon; chattering squirrels leap,
The gay-hued parrots glance like living flames
And the red trogon tunes his mellow lyre.
Around the shores the sacred ibis flits,
The snowy pelicans their files extend,
The stilted avocet that wades the shoals,
The black geese and the gray-hued spoon-bill tribes
And all the gorgeous fowl that haunt the wave.

High beats the hunter's heart, when all the night,
Hid in some gloomy copse, at edge of wood,
He watches the dim plain for wandering game.
Calm sleeps the forest, save when swells the voice
Of prowling lion or hyena's howl,
Or cracks the twig beneath some trampling hoof.
Soft falls the moonlight, filtering through the roof
Of the dense-matted foliage; soft gilds
With shimmering glory all the desert spaces,
Shining on island groves and grassy slopes.
From time to time like drifting shadows pass
In lengthed files the browsing buffalo,
The eland, gnu and the black antelope
Glide past; the bulky elephant
Swaying his tushes crushes thro' the glade;
The black rhinoceros stalks unwieldy by,
Seeking sequester'd marsh or deep lagoon.

ISAAC McLELLAN.

—Ground Quassia wood is highly recommended as an insect destroyer, in the high authority of M. Cloez of the Jardin des Plantes. Will some of our readers use it, and give results?

—In England, the aggregate income of 5,000,000 families employed in manual labor is about \$1,500,000,000. Of this sum \$450,000,000 is wasted in excessive drink and tobacco, in buying at small retail stores instead of wholesale stores, but quite the larger proportion in unskillful or careless marketing, housekeeping and cooking, and in the mullets of trades-unions.

—The red blood corpuscles of the *Salmonidae* are the largest found in osseous fishes, the blood disks of the *Salmo Fontinalis*—American brook trout, measuring 1-1455 of an inch.

—A plaid and a tartan have two entirely different meanings. The plaid is the name of a garment without reference to color or material, the word tartan meaning the parti colored pattern. Somehow the two words have got very much mixed.

A LAMENT FROM GAY HEAD.

OFF MARTHA'S VINEYARD, August 23, 1873.

EDITOR FOREST AND STREAM:

That a yacht owner should know how to take his trick at the helm and negotiate railroad bonds, should be able to reef a halliard and financier, is perhaps asking too much of ordinary human nature. We cannot all be journalists and fishermen, any more than we can combine the skipper and banker together. Yet I feel sure you will allow me to remark that among our yacht owners we have quite a number of Admirable Crichtons.

I notice a good deal of censorious writing indulged in at times in regard to the incompetency of our yacht owners, and the frequent attempts made, I think in the worst taste, to ridicule certain gentlemen on account of their ignorance in sailing. Of course, some men affect an excessive nautical style, and are all prone to assume a commodore's manners without even that general acquaintance with seamanship which would render them capable of commanding a cock-boat. True gentlemen, I believe, always detest shams, and I have generally found that any false assumption of this character was met by such roars of laughter on the part of fellow yachtmen as to make the pseudo skippers haul down their colors. The best thing a yacht owner can do, if he is ignorant of sailing, is to say so, and there is a frank, honest way of stating such want of acquaintance which precludes ridicule. I write this, because after a pretty heavy blow yesterday, when it looked quite ugly for a time, in the coolest kind of a way my host, the owner of the yacht I am now on, said to me: "My dear Mr. —, if you get drowned, I trust you will not put the blame on me, for really, I would not know how to manage her now any more than would my wife, who by the way, is very sick below. Of course, I know the yacht's stem from her stern, but I should be an idiot, though I have had a yacht for fourteen years, to say that I know anything about seamanship, and what is more, I never expect to encompass its mysteries. Fatigued with business, the hours of quiet I spend on my yacht are the most pleasant of the whole year. It is worth all it costs to be certain that no one can call on me, save at my pleasure. To have somebody else to take care of me, and good care of me, to throw off every responsibility, is just what I want, and I am sure my sailing master is quite capable. Do our friends who run horses at Fordham, or Saratoga, or at Long Branch, know much about their animals? Could that distinguished banker, who stands at the head of the patrons of the American turf, ride his own horses? Suppose he even did, somebody would be found to abuse him because he could not groom his racers. You must acknowledge that it is a hard thing in this blessed country of ours, when a man can't keep a yacht according to his own pleasure. Of course, if I were twenty years old, perhaps I might find pleasure in tarring the rigging, or scraping the yacht's bottom, or slushing the masts, (if I have made any error in my nautical nomenclature I hope you will correct me,) or going aloft. I only wish I could do all these things. Well, if any good fellows want to do it they are quite welcome to try it. Corinthian sailors—that is the name they give them, I believe—do they cook for themselves? Of course, there is no degradation about that sort of thing, and as to cooking, I know I could do that quite well; only this, that in just such a blow like we have gone through,) for, by George, it did blow,) I feel a great deal safer when I know the helm is in the master's hands, and that the crew all were picked seamen, than had the yacht been in charge of any Corinthians I ever heard of." Of course this entire assumption of ignorance on the part of my host in regard to sailing, was somewhat assumed, but I think in the main he was right. We have had a succession of very bad days, with no end of dirty weather, and the capabilities of the good yacht—as a sea-boat have been tried to their utmost. "Gitting drowned for fun," as the honest captain of a lumber schooner said to us the other day, as we passed under his stern, "ain't no sense, mister; why the deuce you smart chaps go kiting around in a nasty blow like this, I can't find out. You'll be coming to grief some o' these days." What more he said I do not know, as we were soon clear of him, going head down and taking plenty of green water. But the good old skipper was right; for an hour afterwards we were only too glad to find a berth alongside of him. "It's a raal bucking agin Providence," was his remark, as he sat down at our table, discussing a glass of something warm; "sailing and fooling don't jine much; but ef ever the man that managed that craft of yours wants a berth, send her to me and I'll give him a place."

It may be some days before we are in sailing trim again, as we have splintered our topmast, and things generally want tautening aloft and aloft.

L.

—The inhabitants of the Andaman island, have the high privilege of squatting as the lowest type of the human race. They wear no clothing, but plaster their bodies over with mud. They are cunning and treacherous, and their antipathy to strangers amounts to a passion.

—Baker has positively determined that the Lakes Tanganyika and Albert Nyanza are really one body of water, not less than 700 miles long. If this is so it puts Lake Superior's nose out of joint.

—The total cost of all the railroads in the United States amounts to \$3,159,423,057. The gross earnings were \$473,241,055, net earnings about \$165,754,373.

News From Abroad.

NOW from plantation, preserve and moor, from brae and heather, throughout all England, Scotland, Ireland and Wales, resounds the gun. The railroad porter awakening from his lethargy, carries under his arms the gun cases, and stows away the pointers and setters in the vans, and earns great harvest of shillings from the gentlemen who take the "grouse trains."

In certain sections of the country where game has been thoroughly preserved, perhaps the sport may be considered as a trifle unsportsmanlike, resembling a battue. Good old authorities deprecate the grouse drives, and the indiscriminate slaughter of the birds. If the younger school derides the antiquated style of bagging the birds one by one, the fathers retort on their son's expression of "pottering" after game, by leaving out one syllable of the epithet, calling it "potting" grouse. So far accounts differ as to the quantity and condition of the birds. In England, though the grouse are hearty, in Scotland, especially in Forfarshire, grouse are said to have suffered from an epidemic of quite a virulent type. Good authorities think game will not be as plentiful as it has been for the last two seasons.

On the Continent the ubiquitous Englishman is seen casting his fly wherever the casual trout could have been supposed to have found an existence. At home, by loch, mere and tarn, by river, brook and rill, the eager fisherman pursues his prey. There must be so many fishing lines in the streams, that one can almost fancy that the light of the sun would be obscured. Think of "a Great All England Angling sweepstakes," fished for in Lincolnshire, of 420 contestants, of six miles of river bank umbrageous with fishing poles, and of the scarcity of the fish, or the skill of the fisherman, when three pounds fourteen and a half ounces win the prize.

Athletic sports, save country cricket, are at a stand-still for the nonce. Amateur experts a trifle seedy over the early summer work, are recuperating, and training again.

The Paris *savatte*, or the French art of boxing, is being recuscitated. At most this is a villanous game. To the play of the fists, is added human mule kicking. An adept in "*la boxe Francaise*," may feint at you with his left, and instead of hitting from the shoulder, plant his foot under your jaw—or kick you in the pit of the stomach. What says a grand old English authority of 1754 on this new subject? "The dexterous use of the fist is a truly British exercise, and the sturdy English have been as much renowned for their boxing as their beef. To this nutriment and this art is owing that long established maxim, that one Englishman can beat three Frenchmen, and from hence we may conclude on the principal of philosophy, that the elastic spring which darts from the knuckles of the Englishman, falls into the heels of the Frenchman."

On the 9th July, 1792, Mahommed Effendi, the secretary of the Turkish embassy, exhibited his great strength by shooting an arrow 415 yards, partly against the wind, and 482 yards with the wind, in a field behind Bedford House, London. He used a Turkish bow, drawing 160 pounds. The arrow measured twenty-five and a half inches, which he pulled three inches within the bow, so as to make the draught twenty-eight inches. He said upon the ground that Selim, the then Grand Signior, often shot 500 yards. That this fact as stated was true, is proved by the testimony of Sir Robert Anslie, ambassador at the Porte, who declares that in 1798 Selim drove an arrow into the ground at a distance of 972 yards, the British ambassador having measured the flight of the arrow. It seems, then, that at one time the arrow had almost the range of a rifle.

In the New York *Times* Dr. Russell thus describes the rooms of some hunting noble in Syria:—"Hence, there is a long vista of rooms visible, opening one into the other, and entering the first of these I was at once struck with the eccentric garniture and furnishing, which are continued room after room for some twenty-five apartments. On the walls were fixed in triple rows the skulls and antlers of deer. The chandelier was made of antlers of deer. The sofas, chairs, and tables were supported by antlers, and the seats were covered with the skins of deer, red roe, and fallow. In intervals of this forest of horns appeared ancestral portraits of the Lambergs and their relatives."

The pawn broking system in Scotland, is said to engender vice, and misery. A curious calculation has been undertaken to get at the total number of pledges made in the United Kingdom. It seems a pawn-broker must issue 40,000 tickets, in order to make money. In Scotland the whole number of pawn tickets issued is about 18,720,000, and in the United Kingdom, the number of pledges at that ratio would be 206,780,000.

General Sir John Foster Fitzgerald is possibly the oldest General in the world. His first commission dating back to October, 1793, at Salamanca, in 1813 he was a colonel. Eighty years of honorable service must command respect.

The Register General's report in England seems to point to the fact, that the average duration of human life is increasing. Not many years ago it barely exceeded thirty years, now it is within a small fraction of forty-one.

There is somewhat of a growl heard at present, in regard to a supposed disposition on the part of Germany to get a permanent hold of Lower California. We are for the Monroe doctrine every time.

The use of an indicator on breech-loading fowling pieces, to show whether they have a cartridge in them or not, seems to be becoming quite universal in England.

Woodland, Lawn and Garden.

AN UNDERRATED ESCULENT.

MR. Charles Dudley Warner, in his charming "Summer in a Garden," one of the nicest, freshest and cleverest bits of witty writing we know of, unintentionally we feel sure has done injustice to beans. "There is no dignity in the bean," he sacrilegiously cries. "The bean is a vulgar vegetable without culture, or any flavor of high society among vegetables." He almost intimates, rash man, that it has no historic claims. We cheerfully forgive him his lack of that familiarity which so many people possess in regard to Phœneecian manners—almost a speaking acquaintance we might say with Belal or Belus or Baal or Bel—(zebub). The latest agricultural reports declare that old the African bean and the true Yankee bean are so similar in appearance, as to lead anybody who grows them, to declare that they must both have come from the same pod. What is the connection between the Phœneecian and the bean? Why to-day the descendants of this very same people celebrate the advent of the bean. It is true they are colored people, but that makes no difference, save to show that the love of the bean commenced with Adam. A learned English magazine writer states as follows: "During the period of the year called *Nissam*, that is to say, when the bean-plant begins to blacken, the negroes of Algiers and its neighborhood assemble at the Koubba of Belal to keep what they call the *Aid-el-Foul*, or the fete of beans. Previous to that period they are supposed to have abstained from eating this vegetable. An ox is then sacrificed and dancing is next in order. Here men and women, seized with fits of enthusiasm, often fling themselves into the sea, and at times it is only with considerable difficulty that their companions are able to rescue them from drowning." We feel sure that after this high authority, the clever editor of the *Hartford Courant*, will somewhat modify his judgment in regard to beans, and that some future fete de beans may be inaugurated under his auspices.

—George May Powell, who has been recently investigating the culture of the olive in Palestine regards that tree as especially adapted to the mountain regions of Virginia, North Carolina and Tennessee. First results are tardy, but an orchard of 100 trees per acre requires far less care than our fruits, and yields for centuries, when in bearing, from two to five dollars per tree. He says:

"No other country has such floral variety as this. Flowers from the limits of the temperate on Hermon to the tropical on Jordan are here, and all compressed in less than the limits of the State of New Hampshire. From no other country can we secure more of value in the line of seeds and cuttings, and if a proposed organization of a Palestine Farmers' Club succeeds, there will be a medium of exchange. As a field for the study of birds, flowers and stones the naturalist will always find Palestine remarkable."

—In Acheen there blooms a flower the parasitical *Rafflesia*, which measures three feet across. One is a nosegay. But then, in the vegetable way there is a tubercle edible root of 400 pounds, and with this a shell fish, on which twenty people can dine. How the Dutch are going to starve out the Acheens remains to be seen.

GREENHOUSE AND WINDOW PLANTS.—If new houses are to be built and old ones altered or repaired it should be done while there is plenty of time, and not postponed until the houses are likely to be wanted. The heating apparatus will need overhauling to see if it can go through another winter without repairs. Supplies of loam, leaf mould, decayed turf, and sand, are to be laid under cover for winter use, and orders sent for the needed stock of pots. Camellias and other evergreens from the greenhouses will need especial care in shading and watering this month, and all greenhouse plants that are set outside should be cared for. If not properly protected they may be thrown over by high winds or they may be attacked by slugs and insects or injured by dogs and cats. Plants in the border which it is intended to repot should not be allowed to grow out of shape; an occasional pinching will prevent this.—*Agriculturist*.

SHADE-TREES A PROTECTION AGAINST FIRE.—An Oregon paper draws attention to the fact that the shade-trees planted around several blocks of buildings in Portland, preserved them from destruction during the recent great fire in that city. "It was observed," it remarks, "on the day of the fire, what wonderful protection our maple and other trees planted along the streets afford. Many buildings, among them the First Congregational Church, were saved by the thick foliage of the trees in front of them. Were trees planted along our business thoroughfares, they would afford such a cover that a building would not easily kindle from a burning structure on the opposite side of the street. Fire thus could be prevented from spreading. The trees are a cheap insurance, and worth as much for health and comfort as for defense against fire."

FINE APPETITES.—As a rule the half-breed, like the Indian, eats inordinately. If he has fasted for a time his cravings seem never to be satisfied. An Indian and a half-breed sat down to a pot filled with a fish which must have weighed, before it was cooked, fully twenty-five pounds, and they finished it, leaving only the bones, after which they swallowed a quantity of pemican. They still looked so hungry that it would have been dangerous to have left any edibles within their reach.—*Canadian Monthly*.

—Otter hunting, has been revived in England, though the master of an otter hunt was drowned lately.

Athletic Pastimes.

CRICKET.

THE Waltham cricket club, in the absence of their expected visitors, the Mannhattans of New York, owing to the death of the latter's Secretary, concluded to play a quiet game, when the rain interfered and the stumps were drawn. Waltham's 133; picked eleven 55.

August 23rd. A game was played between the Waltham's and Alpha's of Salem, which was decided by the first innings. Waltham 133; Salem 42. In the score for Waltham, Howarth being in fine batting form, made 54 runs. The Waltham's have played ten matches this season, and have only been defeated once, by the Mannhattan's of New York.

The St. George's Club have played already this season ten matches, of which they have won seven, drawn one, and lost two; the latter were one-day matches decided by the score of the first innings. The Club's eleven went to Boston last Friday to play the Walthams, and Boston Clubs.

The Mannhattan Club have a fine team this season, and on one occasion defeated a strong eleven of the St. George's by nine runs on score of first inning; this was a very creditable victory as the St. George's played with their professional.

The Prospect Park Club of Brooklyn is yet in its infancy and turns out a goodly number on practice days. At an early date it plays the Staten Island and Mannhattan Clubs.

There are also several other clubs of note in the different States, notably in Philadelphia where of course the Germantown takes the lead, next the Philadelphia and last but not by any means the least, the Marion club in Vermont. Dr. Coit's school (after the style of Rugby) we are pleased to hear, can turn out on practice days four elevens, and some of the school boys have been elected junior members of the St. George's of this city.

We regret to hear the death of Mr. George T. Keiller of the Brooklyn Union, who was unfortunately drowned while bathing in the waters near Center Moriches, L. I. He was a great supporter of athletic pastimes, and was secretary of the Mannhattan Cricket Club, also Vice President of the Prospect Park Cricket Club, at the time of his sudden demise.

The Dogget coat and badge for the best Thames Waterman, was founded in 1715. To win it the contestants must pull five miles from London bridge to Chelsea. The original condition was that it had to be pulled against the tide, but people are more merciful now, and the race generally comes off at slack water. It was run this year by Mes-suru.

Another swimming match took place last Saturday in the East river, foot of 56th street. There were eight competitors. The first prize, a gold ring, was won by August Ernst, and the second by William Foster. This was followed by a boy's race.

The fourth championship game between the Athletics and Washingtons was played at Philadelphia last Saturday, the Athletics winning by a score of 7 to 2. McGeary and Hines led off in batting, and Sutton and Thomas in fielding for their respective nines. Brilliant fly catches were made by Sutton and McMullin that resulted in double plays. The weather was clear and favorable, and the umpiring impartial.

On the same day, at the Union grounds, Brooklyn, E. D., the Athletics beat the Mutuals by a score of 6 to 5.

The Athletics left on Monday morning for a tour to Washington, playing the Athletics at Philadelphia in the afternoon; the Baltimoreans at Baltimore on Tuesday, and the Washingtons at Washington on Wednesday. On Thursday they play the Athletics again in Philadelphia. On Saturday the Athletics and Bostons will play at Boston.

—Emma Black, who lives in a small town in Mississippi, saved a man's life recently in a curious way. He was fishing, and having fallen out of his boat, was making all possible haste to drown when the maiden perceived his plight, and swimming out to him, threw her hair, which is nearly four feet long, into his grasp, and towed him ashore.

WALTHAM, MASS., August 23d, 1873.

EDITOR FOREST AND STREAM:—

DEAR SIR—Cricket certainly is looking up in this section, more so than for years. Several new and strong clubs have been organized. One or two of the older ones are at present making more stir than usual. Salem, Needham, Boston, Waltham and Harvard still live, and have their annual interchange of matches with varied results. For the last four years the most matches have been played by the Walthams, which, as a club, has existed since 1857, and has been the fosterer of neighboring and junior clubs; the result of this care is evidenced in the improved elevens of the last four years. Since the addition of A. Eastwood to our number the club ranks with any in the East, and is a good opponent to those of your city, as the result testified in a recent visit to New York, winning easily a match with the "Jersey City," losing only with the "Mannhattans," and playing a fine batting and fielding innings against the St. George's, which deservedly merited the praise given and success earned. Next week we may look for some excellent cricket all round, as we expect the St. George's, the United eleven of St. Louis, and are daily practicing, so that we may give them a hard road to travel. From these interchanging games we look for still more interest, being stirred up in all Athletic pastimes, in which cricket undoubtedly stands pre-eminent. The matter of factness of base ball, coming and going in two or three hours' time, looks too much like business when compared with the genial sociability which cricket tends to engender. It brings about a contact individually which the nature of our national game forbids as at present conducted.

FELIX.

The seventeenth annual games of the New York Caledonian Club will be held at Jones' Wood on September 4th. These games are of very ancient date in Scotland, and are carried out here with all the energy and success worthy of "Old Caledonia." They consist of running, walking, jump-

ing, pitching the stone, tossing the caber, dancing the Highland fling, sword dance and other equally difficult pastimes. The Scottish games of the Brooklyn Caledonian Club take place on Myrtle Avenue, Brooklyn, August 29th, when a large delegation from other Scottish Clubs are expected to send their best athletes.

We find in the Brooklyn *Eagle* that a strong nine is organizing from the several leading ball clubs, the list of names including Start and Matthews, of the Mutuals, Carey and York, of the Baltimore, and Ferguson, Burdock, and Remsen, of the Atlantics. Ferguson is getting up the club, and hopes to get in Allison and Eggler, of the Mutuals, in which case the nine will be complete.

In Philadelphia on August 25, the Atlantics beat the Athletics—10 to 6.

In Easton, Pennsylvania, on August 25th, the Fly Aways, of New York, beat the Easton club 30 to 5.

Several gentlemen of New York have recently started a Club at Summit Lake, Orange Co., New York. They have eighty acres of land and a lake half a mile long, with a club-house and shooting box, black bass and pickerel fishing, etc.

The officers are Fred. W. Jones, of New York, President; Jos. F. Meeker, Brooklyn, Vice President; Elisha Stockbridge, Highland Falls, Treasurer; Isaac L. Noxon, Highland Falls, Secretary.

—Newtown Creek is becoming a favorite training-ground for oarsmen. William Gannon, who is to row a race against Hughes, Sept. 3rd, has his head-quarters at the American Boat-house. Hughes puts up at Burnett's and starts out every day from the Seawanhaka Club-house. They can be seen every day on the creek pulling lustily and getting in condition for the approaching contest.

—A Halifax dispatch says George Brown is still willing and anxious to row Biglin upon the same conditions as those partly agreed on for the 28th inst., and will extend the time for three weeks, and make a deposit of half or of the whole of the stakes when and where required.

—The annual regatta of Riverside Rowing Club takes place on the Genesee river, Sept. 8th. There are eleven boating clubs in Buffalo and nine in Rochester; with this force at hand, there is no reason why they should not become the greatest boating centres in the State.

A DISCONSOLATE NATURAL HISTORY MAN.—M. Houzeau, author of a ponderous work on the Mental Faculties of Animals compared with those of Man, is deeply exercised over the apparently impending extinction of the anthropoid apes. In a letter addressed to a well-known Scotch naturalist, he expresses his regret that none of the anthropoid apes inhabit Jamaica, where he himself lives, and that he is thereby deprived of the opportunity of studying them. "They should," says he, "be tamed, domesticated, and studied in their own climate—at home. The gorilla, for instance, should be perpetuated in Guinea, in domesticity. As I stated in my book, it does not appear impossible that he might learn to talk. Should the attempt succeed, even partially, what would be the bearing and importance of it physiologically and historically?" We wonder what M. Houzeau understands by the word "talk." If he alludes merely to the utterance of articulate sounds, it is quite possible that the gorilla might be taught to "talk" at least as well as a parrot or raven. Those, however, who see in language something over and above the mere emission of articulate sounds, and who recognise it as being fundamentally nothing more than an expression of reasoning mind, will have some difficulty in realizing to themselves a "talking" gorilla. Why not a "writing" gorilla, since writing, after all, is only another form of talking? What would Mr. Murray give for an "Autobiography of a Gorilla," edited by M. Houzeau?

According to a statement made by the Washington correspondent of the Boston *Post*, Secretary Belknap will assign colored graduates of West Point exclusively to commands in white regiments. The Secretary explains that the law leaves no option; he is required to officer colored regiments with white men, and, therefore, he must assign colored West Pointers to duty in white regiments. If the law really leaves no choice to the Secretary but to place white officers in command of colored regiments, then it follows of course that the colored officers must go into white regiments, if assigned to any regiment whatever. We can only say that this law, which we cannot find in our compilation, does injustice to both races, and will be unpopular with both, and will cause a poor state of discipline in regiments thus officered by men of color different from that of their commands. Black regiments would ask why a black man is not good enough to be officer over them; and, precisely the same spirit of race feeling, white soldiers will want to know why negroes are put above them. The effect of the law will be to stimulate prejudice, and both races have reason to be offended at it. It would be better for white and black regiments alike that the law-making this singular requirement, if it exists, should be repealed, and things be allowed to take their natural course. *Esprit de corps* is a sentiment of the highest conceivable value in a regiment. This, it seems to us, must be impaired, by arousing race prejudices between men and their officers, on the plan proposed. Of course, the Secretary of War has means of compelling white men to submit to colored officers and colored men to obey white officers, but it does seem foolish to take the risk of causing insubordination in the army, when it could be avoided by a repeal or modification of the law, on the suggestion of the Secretary.—*Journal of Commerce*.

The "Optimus" Guilford coach, driven by a veteran of the old school, and guarded by an amateur "of the first water," leaves Picadilly, London, daily. Fare 8s; box-seat 2s 6d extra. You can coach it too to Brighton.

English gentlemen living in New Zealand, declare it to be no paradise, "because there is nothing to shoot."

Natural History.

THE SPRAT AND THE WHITEBAIT.—Among the smaller kinds of the herring tribe found on the coast of Europe, there are two much valued by epicures, and known in the English markets as bait, as the sprat and the whitebait. The first of these bears among naturalists the specific name of *Clupea sprattus*, given to it by Linnæus, from its English cognomen. It is found along the coasts of Northern Europe, later in the season than the common herring, and during the winter, keeping in shoals of such a size that a ton has been taken from one of them in a few casts of the net.

They spawn in the early summer months, and pass the rest of the season in deep water, where they are pursued by larger fish. In November they approach the coast, and are caught in fine meshed drift nets, and large bag nets. The sprat is six inches long when full grown, and is much esteemed by all classes. It is generally eaten fresh and may be preserved also.

We have several small species of herring on our coast, whose specific distinctions have not yet been definitely settled, but fishermen need not wait until that has been done. Let them try to furnish our market with small herrings and call them *sprats* until more is known about them. At present all small herring are here called *ulevines*, a word of Danish origin, but they are not systematically pursued, and no regular supply is furnished to the fish stands.

Another small herring species is the whitebait, which frequents the English Channel and the Thames; and which is caught from April to September, though it is best in mid-summer. This little fish varies from two to six inches in length, but they average about three inches or a little more. They are captured in peculiar bag nets of very fine mesh, whose mouth is kept open by a frame, the boat being anchored in a tide-way and the net hanging over the side, not four feet from the surface. The tail of the bag is handed into the boat at intervals to be emptied of its contents.

We cannot here enlarge upon the delicacy of this little herring as an epicurean delight, but if any gourmand on this side of the Atlantic wishes to partake of it he can easily do so, for a nearly similar fish frequents our bays. Some years since Elwell, an English fisherman, who at that time lived at the tip of Red Hook point, brought me in April or May, a basket full of small fish and asked me to pronounce on the species. As before said our species of herring are not satisfactorily determined, but I told him that I believed his fish to be full grown herring of a kind closely resembling the London whitebait. "I thought so too, sir," was his answer. Dekay and Storer both describe several small herring, and perhaps Dekay's *Clupea minima* comes nearest to the fish brought to me by Elwell, who procured his fish near the Staten Island shore of the narrows.

If our fish dealers would stimulate the fishermen of our harbor to look out for this American whitebait, large quantities of them could no doubt be furnished. It appears that in Washington some small fish have for some time been sold as whitebait, but Professor Agassiz on examining them pronounced them to be a mixture of the fry of perch and other fishes. This may be true in the latitude of Washington, but that a small summer herring which is not the young of the shad, runs up the river here, is certain. Let our Fyke-men procure the proper nets and try to capture this marketable and delicate food. J. CARSON BREVOORT.

Facts have quite recently been brought to light in New Zealand, that may be of some little interest to those of our readers who are on the *qui vive* for all that is new and interesting to their beloved art.

Sometime ago large quantities of salmon-eggs from English waters were shipped to New Zealand. They reached their destination in twelve days. It was at first deemed doubtful that they would survive this protracted voyage in good and healthy condition, although packed in ice. Four boxes of ova, packed alike, were received, and when these boxes were opened, the temperature was just 38° Fah. The report of Mr. Buckland who made the observation says: "In one of the boxes, the eggs nearly all contained living fish; in another they were 'blind,' or in other words, no embryo could be seen in them. In all the boxes there was a certain percentage of eggs which had turned quite white. Some of these white eggs had a concave appearance, a spot, exactly the color of a strawberry, which covered a third part of the egg."

This experiment so carefully made, amply repaid for all the care bestowed upon it, and promises in a most satisfactory manner that salmon-eggs may be kept in a healthy condition this length of time, and perhaps longer.

The fact of this experiment will go far to prove the value of making repeated and careful experiments in salmon culture.

—Prof. Hayden, in charge of the Colorado Exploring Expedition, has already collected and forwarded to Washington 227 different varieties of North American grasshoppers.

—Prof. Pulman, Salem, has been making investigations on a curious fish—the Liparis—which has for a long time been a subject of special interest among zoologists.

—Mr. Poppe of Sonoma, has introduced the German carp to California. The Napa Reporter reports thousands of little fish of this species in his pond. They are so tame that they suck milk from his milkman's fingers.

—A fine specimen of the Hawkesbill turtle (*Caretta imbricata*), the species which furnishes tortoise shell, has been presented to the Central Park Zoological Garden.

—A man at a picnic in Massabesic, N. H., discovered a fish on its back in the water showing extraordinary activity. He caught it and found within another fish which had proved too large for its oral capacity. While he was examining it, it was proposed to pull the smaller fish out of the other's mouth. There then appeared within the former's mouth a still smaller one. They were not dead when found, but would have died shortly. They were all perches and measured respectively thirteen inches, seven and a quarter, and three and a half in length.

It is possible that the same story exists in the United States as in England as to Hedgehogs sucking cows? Mr. Frank Buckland wants more evidence about it. Here is a correspondence on the subject.

"A dispute has arisen consequent on my defending the hedgehog from the charge of sucking from the teats of cows, an idea, I thought, long since exploded. It was finally arranged that the matter should be considered as finally settled by your decision. I may say that one individual, who backed his opinion with a wager, swears most positively that he has seen the cow rise from the ground and walk away two yards with the hedgehogs still clinging to the teat.—A. B.

[It is a curious thing how these old fancies crop up from time to time. If a hedgehog's mouth be examined, it will be seen that it is much too small to take in a cow's teat. Hedgehogs are very fond of milk, and I think it is very likely that they will lick up from the teat any milk, that is exuding—hence the origin of hedgehogs sucking cows, I should be glad to receive more evidence on this point.

FRANK BUCKLAND."

× LONGEVITY OF ANIMALS.—Highlanders believe that the deer is the longest lived of all creatures, save the eagle. They have an old Gaelic proverb which is worth recording:

"Thrice the age of a dog is that of a horse;
Thrice the age of a horse is that of a man;
Thrice the age of a man is that of an eagle;
Thrice the age of an eagle is that of an oak."

The exact longevity of animals, has never been properly determined, and is a subject worthy of special attention. We have seen an English horse in Canada thirty-three years old. We would like to have some authentic data on these subjects.

LEGACIES IN AID OF SCIENCE.—The will of the late Elias Durand directs his son to "present all my botanical works to the Philadelphia Academy of Natural Sciences, to be placed in the botanical room for the use of workers and to save them the trouble of running to the library," and also "to have my collection of botanical specimens securely packed and sent by express to the treasurer of the *Jardin des Plantes*, of Paris, France, to be added to a larger collection which I presented to that institution in 1868."

—In Cairo, Egypt, is an artificial egg-hatching apparatus which has been in use for generations. The country people bring their eggs from long distances to be hatched out there, thus relieving the hens of a great deal of wear and tear.

FRANK BUCKLAND'S MUSEUM.—There is a very curious establishment at South Kensington, where Frank Buckland, the enthusiastic naturalist, has a small water farm, which he has made most attractive to all who delight in the finny tribe and what else resides in the waters. The small bathing troughs first attract notice.

The troughs swarm with shoals of infant trout and salmon an inch or so long, and there is no reason, beyond the ills to which fish is naturally heir, why any one of these youngsters should not grow into such a giant as the seventy pound swimmer of the Tay—the biggest British salmon ever netted.

The Museum contains casts of almost every fish that swims in British waters, fresh or salt; also several sorts of fish brought from other countries, and which Mr. Buckland hopes to acclimatize in England waters. One glass tank is full of Norway trout, robust and beautifully marked, who made their journey across the German Ocean in the egg and packed in ice. Another tank is peopled with inch-long Thames trout. These swim sluggishly and are a more languid brood. Thames trout are rare, and the angler who has caught one is allowed to boast of it as long as he lives. A third tank abounds with "Great Lake trout," a swarm of strong swimmers, whose parents are passing a cooler summer in the depths of Neuchâtel. These fish have thriven in the Obelisk Lake at Windsor, and have attained to the honor of the Queen's table. Other tanks are inhabited by Cumberland charr, salmon-trout hybrids from the Alsace breeding establishment, and in a cabinet in the centre of the room there are older fish—two year-old lake trout and salmon of ten inches and a half a pound. When food is thrown in they rush forth and dart back to their shelter, and not a crumb is left. Their food is the very best rumpsteak and biscuit pounded together in a mortar. Some of them are so tame that they will feed out of Mr. Buckland's hand. There is a case of Geneva trout in their third year, healthy, handsome speckled fellows, and one of the treasures of the Museum is a tiny brood of *salmon fontinalis*, or American brook trout, sent over in ice in the egg by Seth Green, our famous pisciculturist. These eggs bring in England £100 a thousand. Mr. Buckland has three yearlings of this brook trout, eager, thorough-bred-looking fish, of beautiful markings, swooping down upon a crumb with inconceivable quickness. Still older and larger are some American brook trout in the larger wooden tank seen through the window on the west side of the museum-room, and also in another tank through the door on the east side. Here swim beauties of four years of age and five pounds or so in weight, who take their food with a splash and turn in the water that thrills the heart of an angler.

Among the casts on the walls visitors notice a salmon with the horn which grows from the under-jaw of the male at the spawning season, and which—witness the cast of a fish scored across his side with an ugly gash—is used chiefly for fighting. The room contains many piscatorial trophies.

In the appendix to the twentieth report of the Science and Art Department just issued, will be found an interesting account by Dr. E. G. Dobson, staff surgeon, Calcutta, of the climbing perch of India, two specimens of which he forwarded to the gardens of the Royal Zoological Society of Ireland, being the first fish of the kind which ever reached Europe alive. These fish, it seems, have large cavities in the skull on each side, above the branchial chambers, which contain the greatly expanded, foliated, pharyngeal bones. These bones serve as air receptacles, and from them air is supplied to the branchial fringes: and when all the contained air has been de-oxygenated, the whole is rejected through the gill opening. The manner in which this is done is as follows: The fish rises rapidly to the surface, and at the same instant the mouth is opened to take in fresh air the used up air is forced backwards through the gill openings and rises in large bubbles to the surface. The fish descends immediately, one or two small bubbles usually passing upward, when it has reached the bottom, from the gill openings. The whole thing is done so rapidly that it is impossible to say whether the air taken in by the mouth displaces the used-up air in the supra-branchial cavities, or if the used-up air be first displaced, the vacuum being filled by fresh air entering through the mouth. Almost all the fresh water fish of India are air-breathers, though not provided with such curious expanded pharyngeal bones. The muddy rivers of India necessitate such a provision of nature, for pure water breathers could not pass through the gills water filled with gritty particles. The "climbing perch" have obtained their name from the circumstance of their having been frequently found on the trunks of palm-trees on the margin of rivers, which by means of their highly erectile scales, they wriggle on to as a temporary resting place where to escape for a time the tremendous impetus of a torrent swollen by tropical rains.

INTERESTING GEORGIA ANTIQUITIES.—The Washington Chronicle gives publication to the subjoined letter:

MIDDLEGEVILLE, Ga., August 8th, 1873.

Joseph Henry, Esq., Secretary Smithsonian Institute, Washington, D. C.:

DEAR SIR: By express I send you a precious box, containing one simple pitcher, Oconee; two thrice-perforated augur-bored stone implements, ancient stone work, showing these ancients had the spiral augur hard enough to bore the hardest flint.

The spiral thread is as perfect and regular as any screw. The augur, even used to bore wood, is one of the highest evidences of civilization. What shall we say of the augur to bore flint? Above all, I send you my Oconee funeral urn, about which I before wrote to you. I held it back to gratify public curiosity here, and to get the missing fragments of the broken lid. When plowed up it still contained human relics, distinguishable pigeons' feet and toes, which soon perished by exposure to air, showing air had never had any access before, and that it was hermetically sealed and both air and water tight.

I call your special notice to the structure of the urn; First its graceful form, equal to any pottery; second, its composition, very thin, and yet consisting of three very distinct layers; inside, white, hard, thin enamel, perfectly air and water tight; a foundation for the inner and outer coatings consisting of black sandy matter, hard; the outer coat, graphic clay, kept in condition for writing on during the whole process of the writer's elaborate work, until he could write the whole record.

This written surface if translated, would be as large as the page of an ordinary newspaper. These three layers, trita and coatings, are united by the highest science.

The Kennel.

So many gentlemen of this city and Brooklyn are leaving with their dogs and guns for a shot at the Pinnated Grouse in the West, that it will not be out of place to say a word about the pointer and setter.

The pointer, as a rule, is not so much in fashion in America as the setter, by reason of his excessive delicate and nervous system, and his liability to take cold when hunting in wet land. The pointer originally is a cross of the Spanish dog with the gray-hound or fox-hound, by which the delicacy of the nerves of the nose, to some extent, is diminished, and the body rendered more light and elegant. No dog has a higher sense of smell or shows greater intelligence and docility. The principal reason that he becomes rigid, or points, by the scent of game is from the extraordinary condition of his nervous system, acquired hundreds of years ago and handed down to him in a fair unbroken line by his ancestors. A thoroughly broken pair of highbred pointers are so obedient to the voice and gesture of their master and so well trained to act with each other, that a wave of the hand will separate them one going to the right, and the other to the left, so that they hunt the entire ground, crossing each other regularly in front of the sportsman as he walks forward. There is one matter that is generally overlooked in ranging with the pointer. If in early life you have taught him to retrieve, and a case occurs in the field where he has to cross a stream, as the dog returns with the bird, never tell him "down charge." His coat is so thin, and as we said before his organization so delicate, that he is sure to catch cold; therefore by all means allow him to run round a little, taking care not to disturb other game. The color size, &c., of the pointer have so often been described, we will leave that to the discretion of the sportsman, and remark that they ought, if possible, to be light colored, so that the animal may be readily distinguished from the grass, herbage, &c., as no doubt the dark-colored dog is very attractive to the eye in the house, but cannot be seen so easily in the field, thereby causing much annoyance to the sportsman.

The setter is invaluable for the sportsman who only cares to keep one bird-dog. There are several crosses, such as the Gordon, the red Irish, and the American, the latter having resided long enough in the country to entitle him to that distinction. The Gordon is peculiarly handsome,

generally black and tan, and slightly mottled down his legs. The red Irish seems to be all the fashion now among sportsmen; they have delicate noses, great powers of endurance, are very headstrong, and although may appear in perfect trim to-day, next week they will show wildness and a want of steadiness that is very provoking. Never keep them on chain too long; exercise once a day if possible, as their sense of recollection if not often tested, will fail when most needed. English setters, high priced prize dogs imported at great expense and trouble, are not nearly as sociable "all round" as a natural born citizen. A pure blood English setter crossed with an American, will be a far more useful animal, as "high priced prize dogs" are only valuable to get the best strains from. The setter, taking him all in all, of whatever crosses, is by far the most hardy dog, more agile, bears the wet and cold better, his feet and legs being well feathered, is easily taught to retrieve, and has an immense advantage over his smooth-coated rival by his non-liability to take cold.

Where gentlemen are hunting with one or more brace, the dogs ought to be trained that if one comes to a point he will instantly be backed by the other so as to avoid the disturbing of more game than is necessary. The color of the setter is a matter of fancy, but the same remarks as regards the pointer in this matter, will apply equally well with the setter.

—From the Editor's Drawer of *Harper's* we cut the following bit of fun. We have no doubt of its authenticity. It is a fair sample of the general character of state legislation in regard to game laws, and of the absurd nature of the syllabus. We wish it was only a satire:

Bad habit of dog or dogs. Any dog or dogs found or known to run or catch Deer, the owner of such dog or dogs shall be notified of the fact, and if the dog or dogs be found transgressing this act a second time, or more, upon the affidavit of any person who is a lawful witness to testify in other cases before any Justice of the Peace, such Justice shall issue his warrant directed to any constable, to arrest and bring such dog or dogs before him, and, on proof of guilt, may condemn such dog or dogs to be killed; and the constable, upon a copy of such judgment, signed by the Justice, shall forthwith kill the said dog or dogs, and shall be entitled to fifty cents for each dog he may so kill, which shall be recovered of the owner of such dog or dogs.

Notice to owner of dog or dogs.

Violation of act by dog or dogs.

Affidavit against dog or dogs.

Warrant for dog or dogs.

Arrest of dog or dogs.

Trial of dog or dogs.

Sentence of dog or dogs.

Execution of dog or dogs.

Fee for killing dog or dogs.

How far a dog is a game dog, or made game of, depend upon the fancy of his owner. The *Land and Water* describes the Chinese edible dog:

A dog and a bitch of this breed were brought from Canton, where they were fattened with rice-meal and other farinaceous food for the table. They were of the size of a spaniel, but with fox-like heads, the ears being sharp and erect, and the eyes, which were small and piercing, were jet black. In color the animals were pale yellow, and the hair on the back was coarse and bristling. One of the most noticeable features in the anatomy of these animals was the unusual straightness of the hind legs, which had no visible bend "at the hock nor ham." The bitch showed a taste for hunting, and when in motion on the scent of her game she carried her tail curled high over the back. This animal appears to have somewhat the form of an ordinary Italian greyhound, but differs from the latter in having a fox-like head, on which, extending from the eyebrows to the back of the skull, is a tuft of long hair. The tip of the tail, which is long and tapering, is also graced with a similar adornment. Whether there are two distinct breeds of Chinese edible dogs, or whether "all's dog that comes to the net" with the celestials, cannot be stated, but doubtless some of our readers may be able to set the question at rest, as possibly they may also be able to furnish a few hints on cooking and serving up the animal, so that should we at any future time find ourselves in a position similar to that experienced by the Parisians, the many curs lurking about London might then become invested with charms which they do not now possess.

The Magazines.

POLO.

"IN Persia, in the country of Zaiman, there was a king who was leprous, and to him there came a doctor called Douban," and Scheherazade goes on to say how Douban, M. D., made a mallet with a hollow handle filled with drugs, and ordered the king to play at a game with balls on horseback; and the good old Arabian Nights tells how the king sweated profusely over the game, and that he was cured by means of the medicated drugs put in the handle of the mallet, and the sequel is that in the guise of an *honorarium*, instead of receiving so many purses of gold, the king had Dr. Douban's head cut off.

Ex Oriente lux, for from the East certainly comes the game of Polo, brought into England from Hindostan, where the irregular cavalry have been playing it for the last twenty-five years. Polo is simply hockey or shinny, only instead of being played on foot, it is played by men mounted on ponies. From the *St. James Magazine* we copy the following spirited sketch:

"The ball is much larger and heavier than at hockey, whilst the players carry cross-headed mallets with long handles instead of blackthorns. For the rest of it the two games are exactly alike, with well-defined goals at either end of the selected ground, through which Polo-players endeavor to force the ball by the united power of men and ponies.

"At the beginning of each game the sides remain at their respective goals until the umpire, proceeding to the middle

of the ground throws up the ball as a signal to commence. Then, with mallets upraised and bodies bent forwards, the rival squadrons make at each other as if on deadliest thoughts intent, until the player mounted on the smartest pony reaches the ball, and with a quick swing of his mallet sends it humming toward the opposite goal. From that moment the two sides are intermingled as they scurry hither and thither after the missile, which at one moment is nearly driven through this goal, at another through that, and so on, with alternate advantage to the sides, until a lucky stroke gains the victory, and the mimic warriors dismount to give their ponies and themselves a few minutes' rest.

Such is Polo to the casual observer; a fine manly sport, needing good horsemanship and good wind. To the adept it presents far higher characteristics, such as require the player to possess coolness, nerve, presence of mind, good humor, and proved stamina. For instance, the ball having been driven from one end of the ground to the other, between it and the goal but a certain debonnaire giant of the Hussars, who, being too heavy for much forward play, lies back. Merrily bounds the ball towards the doomed goal, whilst a few yards behind it rides, as for his life, a Spanish-looking player who hopes to have one more crack at it before great Jotun drives it back. Vain the hope! Setting his pony into a canter, and judging the distance to a nicety, the big hussar brings down his mallet with unerring aim, just as the Don's is descending, and away flies the ball towards the farther end of the field, whilst Goliath again takes up his sentry-like position. How the great mallets whirl overhead, how the players' supple bodies sway low, first to this side, then to that, how nimbly the ponies twist and turn, striking the ball with their forefeet as if understanding all about the game, and what nasty whacks fall on arm and leg, hand and foot, as the "bully" goes on. Then more charges; then the chances of victory swing first to one side, next to the other; then, as the ponies begin to grow weary, you see their riders skirmishing about on chance of the ball coming their way, instead of following it like sleuth hounds; and then up charges the mighty hussar with his pony still fresh, and the game seems to be over as he gets the ball and strikes it fair for the goal. Not so, however; there's many a slip 'twixt the cup and the lip. One of the other side on a black pony rides up just in time, and the goal is saved. But see, like an arrow from a bow, shoots out the piebald from the crowd, and just as the ball is within a couple of feet of the posts, the Saxon rider cuts across the Don's way, and his mallet swiftly descending, drives the missile to one side. Then a collision; then down go piebald and plucky lord in the dust, whilst the rest of players, riding up, prepare to renew the game. In an instant half a dozen are off their horses, whilst great Jotun supports the lad in his ponderous arms, and saying it is only a bit of a stun, tells some one to bring the big watering pot. Which being done, and the young fellow's curly head duly watered, he comes to himself, looks around somewhat vacantly, rubs his pate which was struck by the piebald's forefeet when they rolled over together, and then calmly asks, "Did I save the goal, old fellow?"

Such is Polo; no more, no less. Seemingly a sport demanding the cultivation of good temper, presence of mind, perfect horsemanship, coolness of judgment, quickness of sight, suppleness of muscle, and unflinching nerve. To be a good player, a man must possess those qualities in a superlative degree, and, since this new game fosters, if it cannot create them, we may safely accord it a meed of praise without being open to the charge of admiring only what is novel. At all events, there can be no doubt that in every point this manly sport is a vast improvement on those effeminate pigeon tournaments which have now happily fallen out of fashion with all but betting men.

Two charges are brought against Polo which it is as well to note. The first, that of danger to the players. This must be granted; in Polo, as in every other manly game with which we are acquainted, there is and must necessarily be a certain element of danger. But until our young men forsake cricket, hunting, shooting, and football in favor of the athletic game of croquet, Polo may be well content to remain under an equal ban. The second indictment is that it is cruel to the ponies. We fear that this is so at present; the hard blows falling on their legs, the severe spurring, and the use of sharp curbs are altogether opposed to modern usages, and if the game is to live, these defects must be amended, for the public will not long care for anything savouring of brutality. There are signs that the players themselves see this necessity and are prepared to meet it cheerfully. Many of the ponies' fore legs are already swathed in bandages, one gentleman, if not more, has extracted the rowels from his spurs, and the club is, we believe, taking into consideration the abolition of curbs. When these reforms are carried out, there is no reason why Polo should not take a recognized place amongst our national sports.

FINDING THE QUININE.

THOSE who undertake to collect bark have a hard time of it. After the Indian has agreed as to price with the dealer, he plunges into the trackless forests of New Grenada. He carries with him enough food for a week, and on his shoulder his axe, and at his side his machette. Without compass, guided simply by his instincts he travels onwards. From time to time he scales some high tree, and from its summit peers into the distance, hoping to find the tree the *cinchona lucifolia*. At last he discovers one and his first task is to make a small clearing round it, for so overgrown is the forest, so strong all the clinging vines, that even did he cut the tree through, there are many chances that it would not fall to the ground. After the tree is felled, the whole of the trunk is carefully cleaned, to get rid of the moss, cryptogamic growth which covers it. The bark is then removed and carefully dried. This bark is then made into a pack and carried to the merchant. Fifteen years ago, an arbo of good bark was worth 3 francs at Pitago, but to-day, 16 to 20 francs is the price.

The quinquand trees are getting very scarce, from their indiscriminate destruction, and the roots of those cut down in former times, are dug up for their bark. Voltaire said "that the Lord put fever in Europe and its cure in Peru." Feouel, however, had a better idea of the wisdom of Providence and clearly proved an affinity to exist between the plants and trees which grow in any country, and their power of curing the diseases which attack men dwelling in that neighborhood. What he should do is to try and find the remedies necessary derived from home sources.—Doctor Saffray's TRAVELS THROUGH NEW GRENADA.—*Tour du Monde*.

MOUNTAIN CLIMBERS.

IF you are wise, you had better not annoy that particular class of Indians, whose business it is to guide you safely over the Cordilleras. If they express a desire to make a halt early in the day, yield the point. It is probable that a mile or so further on there is a dangerous pass, and they want a rest, in order to regain their lost powers of endurance. If you place yourself entirely under their care, you will find them the best and most careful guides. You might confide to them a package of gold dust, and they would not take a grain of it. But abuse them, and they will spare you no mercy. A Spanish officer some years ago, was perhaps a trifle rude to his guides. If the story is correct, he applied a switch to the shoulders of one of his Indians. At the next pass one of the Indians apparently made a false step, and stumbled on the Spaniard. Over went the officer fully 1,000 feet down the sheer precipice below. The Indian guides of Quindio, will show you the place where the Spaniard lost his life.—TRAVELS IN SOUTH AMERICA.—*Tour du Monde*.

THE ANOMALIES OF ENGLISH BETTING.

TO say that Tattersall's represents something more than one of the most flourishing institutions in London—that it is also one of its greatest anomalies—is of course to take up a thorny question. Yet this is the fact. Tattersall's is a perplexity to the House of Commons, to the courts of law, to the police. It is the great outwork of the Ring; and as long as Tattersall's exists, Mr. Tom. Hughes will find himself foiled at every turn in his crusade against the Turf. You may do at Tattersall's what you may do no where else; and the privileges of Tattersall's yard paralyze all the attempts of the police to put down gambling upon race-horses by obliterating or confusing all the lines which the House of Commons tries to draw in business. You may pencil a bet at Tattersall's which, if penciled at an office in Blackfriars or the Strand, or even in the street, will bring the police down upon you in an instant. You may do in the smoking-room of a club what you may not do in the coffee-room of an hotel. You may do in Scotland what you may not do south of the Tweed; and the consequence is, that when the English police are swooping down upon every nest of betting men they can find in London, every English sporting paper is full of the advertisements of agents with offices in Edinburgh and Glasgow; and that the sums of money which a year or two ago found their way to Tattersall's through Jermyn Street and St. James's, now find their way to the head-quarters of the Turf through Scottish bankers. Lotteries are illegal, and are put down with a high hand by the law, even where they are set up under the most plausible pretenses. Yet Tattersall's is the centre of a vast system of gambling which has its ramifications in every town and village in the Empire; and the Derby, the Oaks, and the St. Ledger are growing into a lottery in which we may all take tickets to any amount, with the temptation of almost any possible prize, and the risk of losing only the trifle we take it into our heads to stake.—*Gentlemen's Magazine*.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, trails, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

HANDY.—The section of country you mention is not the *terra incognita* you suppose. It was visited by a hunting party from New York in 1871. Make Halifax your centre of operations. Time necessary to get there and back will be six weeks. Do not depend on finding Indian hunters on the spot, as they are scarce and not reliable.

JOHN B.—Your yacht model will not do. It was tried and abandoned in 1867. Do not waste time or money on it. It has a host of vital defects. Your ideas of rig are also open to serious objections.

S. L.—Yours is a heavy question, but fortunately we found a reply of it by reference to an old collection of sporting items. The largest elephant known to have been killed was bagged by the Duke of Edinburgh. Possibly it was preserved for him. From tip of trunk to tail he measured twenty-three feet and five inches; girth, sixteen feet and six inches; weight, four tons, eight cwt., four pounds, to a hair.

MRS. L.—A good way to prevent your English skylark from hurting himself by flying to the top of his cage is to stretch, not too tightly, a piece of green baize on the roof of the cage, about three inches below the wires.

F. AND T.—From Thunder Bay to Rainy Lake the distance is about sixty-five miles, and no trouble about the route.

ADAMANT.—Your idea of inoculating young dogs with the distemper is not novel. There is reference to it in a book fifty years old. The way it was done was by taking a feather having some of the discharge from another dog's nose on it, and introducing it into a slight wound made on the nostril of the dog to be inoculated.

S. H. T., Boston.—Our columns can never be used for the purpose of promoting any one gun maker's particular system of arms. Treat the matter more generally and we shall be glad to hear from you.

X., Brooklyn.—For 2,000 yards we can give you no size for a target. For 1,800 yards targets have been used thirty-two feet wide; height not given.

THOMAS.—Mr. Hyde, jeweller, of Maiden Lane, has an improved fly-book, in which the snells or gut lengths are kept straight by an elastic cord, the loop and the fly-hook being caught in small brass hooks opposite each other. Nevertheless, we must express our preference for the old-fashioned parchment fly-book, with its various pockets and compartments, and leaves that may be detached and taken out if the whole seems too cumbersome to carry on a short excursion.

C. L.—Rabbits and quail are found on the line of the Northern Railway of New Jersey, from "English Neighborhood" up. Shooting season for quail begins November 1st in New Jersey. For snipe, within an hour's ride of New York, see Canarsie Bay and Jersey coast.

BARTLETT.—You are right. Under the amended law the close season for ducks is extended to the 15th of September. We hope the editors of *For, Fin and Feather* will make the correction.

FLEMINGTON.—Your note was mislaid, but can reply in part. Grey squirrels are scarce, and black ones scarcer yet. We know of no locality where black squirrels are found in considerable numbers except in Northern and Central Michigan. We can't designate localities in a wilderness, but D. H. Fitzhugh, Jr., of Bay City, will readily inform you, we think.

PISCATOR.—The Spanish mackerel is the highest priced fish in our markets, and often brings \$1 per pound. It cannot be considered a game fish, because it seldom takes a hook, even when swimming in immense shoals and intently feeding near the surface. It is captured in set nets or pounds.

QUERIST.—Trout fishing ceased in Pennsylvania on the 15th of August. We have already stated the fact in the "Sea and River Fishing" department of this paper.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type. 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, AUG. 28, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

Calendar of Events for the Current Week.

FRIDAY, August 29th.—Scottish games, Myrtle avenue, Brooklyn.—Pleasure Grounds Association, Middletown, New York.—Driving Park Association, Pittsburg, Pennsylvania.—Hydie Park, Williamsport, Pennsylvania.—Friendship Association, Pittsburg, Pennsylvania.—Carl Park Association, Carville, Illinois.

SATURDAY, August 30th.—Amateur boat clubs, foot of 133d street and East River.—Hydie Park Association, Williamsport, Pennsylvania.

TUESDAY, September 2d.—Goshen Park Association, Goshen, Orange county, New York.—Macomb Association, Illinois.

WEDNESDAY, September 3d.—Rowing of Triton and Passaic Clubs, Newark, New Jersey.—Washington Park Association, Washington county, New York.—Toronto Regatta, Dominion of Canada.—Macomb Association, Macomb, Illinois.—Goshen Park Association, Goshen, Orange county, New York.

THURSDAY, September 4th.—Toronto Regatta, Dominion of Canada.—Macomb Association, Macomb, Illinois.—Goshen Park Association, Goshen, Orange county, New York.—Washington Park Association, Washington county, New York.—Caledonian Club Athletic Pastimes, Jones' Wood.

THE DOOM OF THE MODOCS.

The President and Secretary of War have decreed the hanging of the Modoc "braves," and Captain Jack, Schonchin, Black Jim, Boston Charlie, One-eyed Jim, and Sloluck must swing. Old Slow-luck's fate is none too quick for him.

SING:—

Lo! the poor Indian, with untutored mind,
His hair unkempt and trowsers out behind,
Streaks the broad prairie like a shooting star,
With fell intent and devil-bent for ha'r!
No cares of State perplex his swarthy breast:
He rangeth from the eastward to the West—
Starts a mule train in a blaze of glory,
And leaves not one to tell the story.

Swing up the "brave," the bloody Modoc brave!
The path of glory leads but to the grave.
If Jack must die he might as well die now;
So swing him up—"Hough-ough-wow-wow-how!"

RECEIPT FOR HANGING ONESELF.—To reduce hanging to a system, at least by logarithms, multiplying the cube root of the man, by the length of the rope, is attracting the attention of those familiar with animal mechanics. Should a person wish to commit suicide by suspension, the following rules must be observed. First weigh yourself, then divide your weight in pounds by the arbitrary numbers 2,240, and the quotient will be the length of rope in feet, you should use. The Rev. S. Haughton, an English clergyman, is the author and discoverer of this most invaluable receipt. In future we trust that persons wishing to hang themselves, will make no half-way work of it.

HAS THE SALMON EVER FREQUENTED THE HUDSON RIVER?

It has often been asserted that in the early days of the settlement of New Amsterdam and for many years after it, salmon were found in the Hudson river. This statement, when carefully followed up is found not to rest on a basis of fact. No one has with his own eyes seen this fish taken from the river, and although we have heard the story of the angler who every year took a few salmon with a rod and fly, we never, after diligent investigation could ascertain that this was a positive fact. Perhaps the angler was a cousin of the Flying Dutchman, and had been condemned to fish for salmon in the North river, for reasons similar to those which detained his blasphemous relative in the seas near the Cape of Good Hope. At any rate the attempt to catch salmon in the North river now, would have to be undertaken by a dumb Quaker, in order to avoid the Dutchman's fate.

We find, however, after sifting all that has been said, that the angler was Henry Hudson himself, almost every so-called authority disclaiming any personal knowledge concerning the matter, and referring to Hudson's journal for the proof of it. Now what does Hudson say? His log-book or ship's journal kept during his voyage to our coast in 1609, was not entirely in his own hand, but was mostly penned by Robert Juet or Jewett, his mate, who on the voyage to the great inland gulf named after Hudson, its discoverer, in the year 1610, mutinied against his commander, and abandoned him to his fate in an open boat. This journal was first printed by Purchas in 1625, and has often been copied since. We shall now quote the words of the journal from Purchas himself.

"September 4th, 1609, (Hudson anchored just inside of the point of Sandy Hook). "Then our Boat went on Land with our Net to Fish, and caught ten great Mulletts of a foot and a halfe long apiece, and a Ray as great as foure men could hale into the ship."

September 14th, (among the Highlands about West Point). "The River is full of fish."

September 15th, (about Newburgh). "Great store of Salmon in the River."—"Our Boat went to fish and caught great store of very good fish."

September 27th, (about Tivoli (?) on his way down.) "They Tooke four, five and twentie Mulletts, Breames, Bases, and Barbils; and returned in an houre."

These notices are the only ones which refer to the capture of fish in the North river, in the journal. It will be noticed that in speaking of salmon, it is not said that any were caught. However, if salmon were found here then, is it at all likely that any would be seen or noticed in the month of September? By that time they would have left the river. There could not have been many left in it so late in the season.

Then again how could he prove that salmon were plenty in the river unless he caught some or saw the Indians spear them? This fish will not take a baited hook such as they used, and no mention is made of their being netted or speared. It is probable that large trout, brought to him by the Indians were called by the sailors salmon, or that weak fish (*otolithus regalis*) were mistaken for salmon.

The general way in which the declaration "great store of Salmon in the River;" is made, is no doubt a wild guess, considering the improbability of these fish having been seen in September. Perhaps some dried or smoked fish prepared by the natives were mistaken for salmon. We accept the vague statement in Hudson's journal, therefore, as sufficient evidence to the point in question, and must look to more certain and better testimony before we can believe that salmon once frequented the North river. Why the salmon should have been, and is now again at home in the Connecticut but a few miles east of the Hudson, is not easy to answer. The Hudson, for some hundred and fifty miles from its outlet to the sea, is not attractive to the salmon, as it is salt for half that distance and has a tidal flow each way, nearly to the same point. Besides these objectional features in the eyes of a salmon, the waters of the lower Hudson are muddy, and were probably always so, owing to the quantity of clay which is washed into it from the clay formation that forms its bed about Albany. Its affluents below Albany, for one hundred and fifty miles, are too small for salmon streams, though the upper Hudson and Mohawk seem in every way fitted to tempt this fish to frequent their cleaner and more rapid waters.

Perhaps if the salmon proper cannot be made to thrive here, an attempt to domesticate the Land locked salmon (*Salmo Gleri*) in it would be successful. We throw out the hint for what it is worth and leave the matter to the judgment of our Commissioners of Fisheries. *

*The great Mulletts were probably Drum fish—the *Pogonias chromis*; the great Ray—the *Trygon hastata*; the Breames—*Pomotis appendix*; the Basse—*Perca flavescens*. The Barbells could not have been Chub, which rarely take the hook, but were doubtless cat fish—*Ariopsis milberti*.

Colonel T. B. Thorpe says that when he was a boy, 1830, old men lived in Saratoga county who often told him they caught salmon in the river between Schaghticoke and the falls above, in the Hudson.

We are only too glad to place the well known German-town *Telegraph* among our many valuable exchanges. We know of no paper in the United States, which can be more useful to us. In it we can always find material of precisely the character, which will be appreciated by that portion of the intelligent public who wish to learn of local sporting matters within the State of Pennsylvania.

English fishermen are trying to find the man who introduced pike into the Scotch lakes, and threaten if they can find him to feed him to this piratical fish. The pike are devouring all the other fish.

DEPRAVITY IN HORSES.

Rev. Dr. Deems, the well known and esteemed pastor of the "Church of the Stranger," takes friendly issue with the editor of this paper upon his general assertion that the noble nature and disposition of the horse do not become contaminated by the moral atmosphere of the stable and trotting course. We print his genial letter under the department appropriated to horse matters.

Dr. Deems disclaims being a sportsman in any sense of the word; but we nevertheless shall enroll his name upon the list of true lovers of legitimate field sports, for every syllable he utters is in sympathy and accord with Nature and her attractive charms. The same vein of philanthropy that induces him to labor assiduously for the temporal and spiritual welfare of mankind, crops out in his manifest and avowed regard for the horse. He has always esteemed this noblest of animals from his youth up, and we reverence his affection. From the earliest Biblical times the horse has been the theme of both profane and sacred writers. The poets idealized him, the ancients deified him, and Job has recorded his attributes and graces in the sublimest language that inspiration ever gave to man to use. The earnest admirer of the horse is as ardent in his devotion as the veriest lover of woman. He will go as far in his fondling and caresses. He will kiss its beautiful face, and gaze with overweening affection into its deep, liquid eyes. Aye, more; like Leo Hudson, the great equestrienne, he will die for love of the horse that died. Who will gainsay this? There are gentlemen, technically termed sportsmen, and recognized as such professionally, who think and talk nothing but "horse." Their minds are constantly filled and overflowing with the theme, just as the stock and gold brokers' minds are absorbed with stocks. Their study is in the stable and in the paddock; their literature is in their stud-book; they meet in cliques and knots to discuss the points and strains of horses, and resort to the race-course to see them illustrated in beauty, speed and action. This is their only ostensible business, and they are not, many of them, what may be called sporting men in the vulgar meaning of the word.

Why this supreme love of the horse, we ask? Is it not because of the higher order of intelligence which the horse possesses, and which these gentlemen learn to appreciate by constant study? And is not this higher intellect exhibited in the saw-dust arena, in the chase, and in domestic life by a thousand different traits which form the theme of anecdotes innumerable? And is it not the horse's perceptive faculties and his inborn nobility that, in spite of beatings and ill treatment, and bad grooms' display of temper, and injudicious management, and coarse associations, still keep him noble? The dog, whose intelligence makes him the chosen and constant companion of man, can be wholly demoralized by the bad habits and cruelties of his master, but the horse plods on, cowed, perhaps, but still patient and enduring and heroic, and with a change of owners soon recovers his old spirits and old enthusiasm, and shows the "mettle of his breeding." Less than man is the horse "known by the company he keeps." Of course it cannot be denied that some horses are made vicious and become contaminated and depraved by evil associations. Even angels in heaven have fallen. By this concession our general assertion yields to a qualification. But a "Cruiser" can be reformed, while the angels are past redemption. Much of the horse's character and susceptibility depends upon his blood and lineage. It is just so with men. The lower races are the most easily demoralized, because they are lower orders of being. The whole subject is open to friendly argument and worthy of consideration; for practical wisdom may be gained from investigating how far the horse can become depraved by contact with bad men. We cannot say that we have fully met the reverend doctor's objections in this article. Were we to enter the lists with him properly mounted, we should undoubtedly select a charger that had not been exposed to the moral atmosphere of the training stable.

HARDENED BALLS.

HARDENED balls for the rifle, made of compounds of lead and tin, or of lead and pewter, have been but little used in the United States. Quick as we are to adopt improvements of every kind, the reasons for our want of familiarity with hardened projectiles, may be readily explained. In the United States, save for the grizzly bear and moose, he would have found little use for them. The English sportsman, however, with his wide hunting range, has used the hardened ball for the last thirty years, in his combats with the elephant, the rhinoceros, the hippopotamus, the lion, tiger, and buffalo.

The composition generally used to make a hard ball, is one half tin to four of lead. Some authorities state that a fractional portion of antimony is useful, but we should think, that any projectile similar in composition to type metal would be too brittle. Quite a leading writer, on this subject, states that balls will harden by dropping them whilst hot in fat, buffalo-tallow being preferred, but we regard this as empirical, and resting on no sound chemical or physical basis. Discarding entirely balls made of one homogeneous substance, some English elephant-hunters have used projectiles of lead with a steel point, but these have fallen into disuse from the want of accuracy in their flight.

The use of hardened balls, and the advantages to be derived from them, is a much more complex subject than would seem apparent at first sight. A prominent English

journal in a recent article on this subject, approaches but partly the many difficulties which a discussion of this subject presents. He states "that a hardened ball in striking a bone, when properly made, should flatten against the bone (of the animal) without boring through it, whilst at the same time it must retain enough of its round form to obviate any chance of the increasing distance offered to the larger surface stopping its way, and therefore preventing its penetrating far enough." Here then are two difficulties which apparently militate against one another, the ball must crush the bone, and still have power sufficient to seek a vital point further on. We think this most intelligent writer overlooks somewhat the important subjects of range and velocity, which we think are vital to the subject. If it be the smashing of the bones which is required, we should suppose that a hardened ball, shot at close range, with its high velocity, would least accomplish the purpose desired, for it is at a close range only that elephants, lions and tigers are shot. The advantage to be derived from a hard ball in breaking bones, or stunning the animals which it strikes, would then we suppose be best effected at a slow velocity.

A curious question entering here, is that if the vitality of animals, or the lasting powers they possess to resist when seriously wounded. The Cervi readily succumb, while the difficulty of killing a member of the feline race, has passed into a proverb. This destination of the staying power may even be found in man, for it is a well known fact that an Anglo Saxon is twice as hard to kill as a Chinese. Hard balls are useful in the two extreme cases, where the bony portion of the animal is in large proportion to the fleshy case of the animal, as in the moose and eastern buffalo, and of course, where the bones are covered with a huge mass of flesh, as in the elephant. For lions and tigers, hardened bullets are not as useful as the ordinary ball.

Certainly the great object in using any projectile is to have the animal struck by it, to die as quickly as possible. Perhaps the most unsatisfactory thing we know of, is to shoot a moose, and certain that he is wounded mortally, to be forced to follow him a whole day, before finding him dead. In shooting lions and tigers, of course the preservation of the hunter's own life is to be thought of.

The question of hard balls, is likely to be silenced shortly and for ever by the use of explosive shells, an instrument first introduced by colonel Jacob of the East India service thirty years ago. To-day, sportsmen in the East are using them against the large game, and with notable success. Of the experiences of a gentleman attached to the "FOREST AND STREAM," who used explosive shells in shooting moose in Nova Scotia with great success last December, we trust to be able later, to give some interesting data. We should think our friends in California might use explosive shells most advantageously in their combats with the grizzly bear.

THE NEW CAMILLA.

Pro pudor! What! could a young lady ever dare to do such a terrible thing as to run a foot race? Impossible! Female physique precludes even the idea. Yet it strikes us that when Strauss plays the "Blue Danube," we can see a score of the feebler sex going round and round for an indefinite period of time.

Fixed, determined in our stern purpose, unmoved by the poetry of the dance, fearfully matter of fact in regard to the rhythmic step, though *fourbillons* of gauze floated past as gracefully as the spiral wreathings of smoke clouds, with our watch in hand, we studied the *deux temps* and the German. Shades of Coulon, Vestris, and Cellarius be not enraged! What we were after, with some experience in physical mechanics, was to find out about what amount of vital endurance was necessary when a young lady danced for a half hour. The conclusion arrived at was startling. Though comparative measurements of such things are difficult, we calculated that the waste of muscle was about on an equivalent with that which a good runner would consume in taking a very sharp breather of about four and a quarter miles. How much more additional work the fair *dansouse* was put to, in consequence of her having been forced to breathe and expand her lungs in a vitiated atmosphere could not enter into the computation. Of course our civilization does not allow of our women having the endurance of squaws, but that the most natural exercises of walking and running are entirely ignored in the education of our girls, is very certain. American mothers would be surprised at the physical powers English girls possess. Of course, our climate, with its extremes of hot and cold, will not allow our girls to take the same amount of out-door exercise which their sisters in England enjoy, but such opportunities as are offered to us are sadly neglected.

English women on the continent often put American men to shame. Once when we were younger, there was an Alpine height to climb, and in the party there was a fair English girl of seventeen. At the end of the first twenty minutes of ascent we must needs sit on a rocky ledge to rest. Our lady companion was still going light and easy. At the end of an hour, heavy and weary, we sank to the ground. Skipping along on a high crag away above us, all as nimble as a chamois, was poised the English girl. The road got worse and worse, as still we went clumsily plodding on—staggering on with used up legs. As fresh as a lark on sped this active girl, until she had scaled the highest pinnacle, and from away above us her merry bursts of laughter rang through the air. She had distanced every man in the party, save the guides.

Can women run? Of course they can, and with a very

little practice can attain exceeding speed. If all girls cannot be Camillas, at least the Toronto people are bringing up a set of athletic girls in their midst, for in a late Toronto *Mail* we notice a foot-race to be run by girls of not over fifteen, a distance of 100 yards.

What a happy thing it would be if literary women could only be taught to run; what a beneficial effect it would have on the too morbid female production. Think of the inspiring effects in an authoress a good hundred yards brush would make. Then instead of the *mestarmes*, or "the sad gushings," we would have good, honest, sturdy stuff. The great George Elliot and our own Grace Greenwood have both been, if not fair runners, at least, good walkers.

THE STRIPED BASS.

THE striped bass is the king of salt water game fish. With a good two-jointed bamboo rod, a proper reel and a line that renders freely, the angler may enjoy sport with the bass which no other sea fish affords. It is worth a shilling a minute, this pastime is, from the time he leads off in wild career with the hook in his jaws until the gaff lays him alongside the boat, or high and dry on the shining beach. The sensation is indescribable. With a fifty-six pounder fast to a five hundred feet line going at a fifty-knot rate, and the wheel whizzing like mad, and emptying itself with alarming rapidity, the situation becomes exciting. The fish leads off with a gait as though he would never stop. But he *does* stop, and suddenly. Then comes the reeling in. "Click, click, click!" Faster, faster! Keep in your slack, and stand ready for his first attempt to trip you. Carefully now, for the trial is coming. You scarcely breathe. Bills payable, and all mankind is forgotten—your wife, your children, and your enemies—all, all are absorbed in the game before you; your pulse is up, "the world is an oyster;" the sea is hushed. Up comes the thumb, the turn is made, the bass is on the rampage, and again you breathe free. Then you rest and sweat. Hope is big within your breast. The bass leads astern; everything is clear; the gear is good, and the fish is sure. (This act to be repeated with the next cast.)

But isn't it glorious to watch an ambidextrous veteran like Genio C. Scott, or the quartette of the "Squidnoker" Club cast for bass? With a dexterity which practice can alone assume, they carefully sway the rod until the squid describes its slowly moving circle around the head, and then by a quick, inexplicable movement they cause it to dart like an arrow straight out far over the sea, and the reel whizzes and whirls until it seems to flash fire, and you wait long and patiently for the cessation of the hum which indicates that the squid has dropped. What a wonderful distance; full one hundred feet, perhaps one hundred and fifty!

But our text is bass and not bass-fishing. Perhaps a waif from West Island, Cuttyhunk, or Pasque Island, launched from the pen of some veteran enthusiast of the clubs, may float this way to entertain the readers of FOREST AND STREAM, and better describe the delights of this ocean pastime.

Well, the bass is found along the whole length of our coast from Florida to Cape Cod, at the various inlets, sounds and rivers in both salt and fresh water. If in fresh, they must have access to the ocean, for the bass is an anadromous fish. They vary in weight from the small, newly spawned fish to 150 pounds. No man knoweth their age. They never destroy their kind as the bluefish does. The medium size, say from three pounds to ten pounds, are caught inside, while the larger are found in the surf outside. Great sport may be had with the latter during June to October, at Montauk Point, Block Island, Cuttyhunk, and Fire Island, by backing up a small boat, with a good oarsman to keep her clear, while the angler throws the squid in the surf. It wants good sea legs and courage to fish in this style. The small fry, heeding the old adage "small boats should keep near the shore," may be found in the bays, inlets, and small creeks. In July this is true of this class in Long Island Sound. They spawn in May, and are caught freely with the hook in company with the bluefish fry. By the 1st of August the newly spawned weigh about a quarter of a pound. Large quantities of various sizes, from two to thirty pounds, are seined from deep holes in rivers connected with the sounds. During the winter, unlike the bluefish, they do not all migrate south. When winter comes they are a beautifully shaped fish, and are a companion of the weakfish, alias "chequitt," alias "yellowfin," alias "salt-water trout," alias "suckermag," alias "squeteague." The large striped bass are frequently taken from the surf by hand; throwing either the squid or bait. They are a strong and quick fish, but when hooked are steady on the lead, while the bluefish will jerk, fight, and bite to the bitter end.

SHOOTING JOURNALISTS.

Be not alarmed, gentle reader! None of this fraternity have been shot. None of us have broken the peace. We have merely in mind the prize which Orange Judd, Esq., has offered for the competition of members of the press at Creedmoor. The first announcement of such an offer struck us strangely. What necessity existed in these "pipeing imes of peace," we asked ourselves, to teach the editorial idea how to shoot pistols, guns and rifles? In the flush times of Southern chivalry and the earlier days of frontier civilization, we remember it was customary for each newspaper to employ a *fighting editor* to maintain the dignity of its position. Editors, in those days were *men of mark*, or at all events were obliged to be good marksmen. Pistol

practice was requisite to meet the exigencies of the then conditions of society. Is it possible we asked, that a return of those good old times is anticipated? Is it possible that editorial amenities will be universally exacted by the muzzle of six-shooter, and libels be known no more? Or is it that the prevailing enthusiasm for out-door recreation has reached the editorial sanctum and imbued our journalists with an earnest purpose to make good sportsmen of themselves? Upon these questions we have pondered seriously for ten days past, and now after due deliberation, we come forward boldly to endorse the movement, whatever its significance may be, and to thank Mr. Judd for his liberal offer to the press and the encouragement it gives to editors to patronize the gun-smiths. Too long have we sat supinely as targets for sarcastic and malicious shafts. Henceforward, nobler be our views. Let proficiency in arms be our creed, and our rifle-range one Creed-moore. Throw down the pen and shears, take the gun and rifle, cry havoc, and let slip the dogs of war! We will form whole regiments from the ranks of Bohemians who skulked behind their exemption papers ten year ago. We will present a bristling front to mobs that assail the freedom of the press. "We'll hunt the antelope over the plain." Nay, we will man the Overland stage coaches, and "all full inside," prove to the fraternity of journalists and the admiring world that no fourteen "good men and true" shall supinely yield to four rascally road agents who quietly plunder the coach while we sit by the wayside with folded hands waiting for a passport to Sacramento.

Mr. Judd will consider us as entered for the prize.

TEMPERATURE AND FISH.

THE intention the weather bureau has announced, of giving the results of its observations in regard to the mean temperature of the rivers, lakes and of the ocean on our shores, will undoubtedly be of great benefit to fishermen. The connection between the changes of temperature, as suggested by the *Tribune*, in an excellent article on this subject, and the advent and disappearance of fish, is quite an evident one, and one which must find its perfect elucidation some day. How account otherwise, for the apparently capricious movements of the fish on our shores? The herring, mackerel, cod, and some of the game fish, change their locality, not simply because of their food, but their movements are apparently dependent on the temperature of the water. It is therefore not impossible to imagine that our fishermen, when such meteorological phenomena are understood by them will solve the question for themselves, whether fish may be expected at certain points, the science of the trained observer, and the practical rough tact of the fisherman, going hand in hand. It is worthy to remark here, how many advantages are derived from the solution of any scientific fact, and how practical benefits extend in directions which were at first unthought of.

HOW THE ENGLISH MINER USED TO AMUSE HIMSELF.

"THREE years ago" says a correspondent of a London paper, "I happened to be at Byerly Hill, and an invited guest at a rural fete, called a *Blinks*, given entirely by the miners.

"Women as well as 'lads' attended, and although on a moderate estimate, each one of them must have consumed at least four shillings' worth of intoxicating liquor, the value of the gowns that each wore was not half the money. Among the amusements was a dog-fight in a distant corner of the field, where women were as free as their husbands to back a favorite pup for a shillings; a man fight; and—a sight thank Heaven, I never witnessed before or since—a woman fight; a regular strip-to-the-waist, stand-up-set-to, the backer on the one side being the husband, and on the other side a noble-minded swain, the accepted suitor of the pulgistic maid who was the married woman's antagonist. If I remember rightly, at the eleventh round the maiden Amazon, by a shoulder hit full at the other's breast, caused such a sudden and prolonged fainting-fit that she was unable to come up to the scratch when time was called, and despite her husband's strenuous endeavor to 'bring to' the wife of his bosom by bending her thumbs and applying a pinch of strong snuff to her manimate nostrils, the sponge was thrown up. To be sure the stakes were only a quart of rum, and it was some consolation to observe that a quarter of an hour afterward the parties concerned were all partaking of it as amicably as possible, but it was an ugly sight and one to be remembered."

Matters seem, however, to-day, according to the same authority, to have much improved. From the extreme barbarity of three years ago, they have lapsed to-day into quite a fair amount of civilization, the men wearing glazed leather boots, without any stockings on, but behaving themselves in an orderly way, fighting being entirely excluded from the pastime. Speaking of the appearance of the men, the same writer says:

"Over and over again a score of times a raised hand discovered a thumb or finger, sometimes two, gone; while men with only one eye were as common as among us are men who wear spectacles. Nor was this all. Of their whole number, one in ten at least bore on his face blue scars of powder blasting, and some were disfigured with jagged and deep scars extending from brow to chin. And nearly all are stunted, and have round shoulders, and wan faces, and that shy blinking gaze that invariably distinguishes men who labor in semi-darkness."

At a late meeting of the Berlin Geographical Society it was announced that the Khedive had given the Society £4,000 to further the plans for an expedition into the Sybian desert.

Shot Gun and Rifle.

GAME IN SEASON FOR SEPTEMBER.

Elk or Wapiti, *Cervus Canadensis*.
 Rabbits, common Brown and Grey.
 Woodcock, *Scelopax rusticola*.
 Ruffed Grouse, *Tetrao umbellus*.
 Esquimaux Curlew, *Numenius borealis*.
 Plover, *Charadrius*.
 Godwit, *Limosine*.
 Rails, *Rallus Virginianus*.
 Wild fowl generally after 15th September, and Ruffed Grouse also in many States.

Red Deer, *Caracus Virginianus*.
 Squirrels, Red Black and Gray.
 Pinnated Grouse, *Tetrao Cupido*.
 Curlew, *Numenius Arquta*.
 Sandpipers, *Tringine*.
 Willets,
 Reed or Rice Birds, *Dolichonyx orizivon*.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

September is at hand! Now, gentlemen sportsmen, examine the bill of fare that is before you, and the variety of game that rewards your patient waiting through the summer months, your scrupulous observance of the close season! Isn't this a feast "to spread before a king?" Now lay aside your trout and salmon rods till the vernal showers and genial sun of the coming spring have released the streams and rivers from their icy fetters. Take the gun and rifle down from their old fashioned pegs and out of their modern cases, furbish their mountings till they reflect like mirrors, with blue ointment remove the slightest taint of rust from the barrels inside and out, shake out the last year's feathers that stick to your game-bags, pick the moth patches from your velvet and cords, "and stand by" as the sailors say, to welcome the incoming month. Then on the advent of the 1st, go forth, armed and equipped as experience and common sense direct, and under the broodegis of the indulgent but protective law, acquit yourselves like men. Take no mean advantage of the sitting bird; even though the cover be thick, you can afford to wait till brown October thins and crisps the leaves. "Jack" no deer, nor throw the blinding gleam of the fire-pan or bulls-eye into their wonder-stricken eyes. Take no mean advantages!

"What! forego the pleasures of the night hunt? Is there no skill in approaching the fily-padded haunts of the deer with paddle as noiseless as the ripple that laves the shore? Is there no knack or required experience in following the gleam that pervades and penetrates the lowering mist until it falls in a pale and uncertain halo, out of which shall presently flash two orbs that gleam like blazing coals? Does it require no skill to shoot a deer under the circumstances? Wouldn't thou forbid the indulgence of the delicious sensation that is born of uncertainty, the indulgence of that thrilling moment when the hunter sits almost paralyzed with eagerness, with pulse-beat and heart-beat that almost pain, nerves drawn taut, bated breath, and exuding sweat that scalds the spine? Is he not liable to the "buck-fever" then?

Stop, good friend! You are all wrong! It has always been understood in every congress of sportsmen throughout the civilized world, that fire-hunting is unsportsman-like and a thing forbidden. By the use of the bullseye or calcium light in our hunting cap of cork, we deliberately proceed by stealth to so paralyze the delicate organism of the deer that they become transfixed with fear. We grope our own way into their secret chambers and give them chloroform! We magnetize the animal first, and take our mean advantages! We turn upon his wondering gaze all at once the full effulgence of a glory that seems to open heaven to him—and all the reward he finds is death or wounds! Take an example in the case of bird shooting—for the same principle governs both. Once at Cape Cod, north of Yarmouth, several years ago, we have seen two men start out in a boat at night with a charcoal fire in the bow, and quietly paddle along a sand-bar where the bay snipe were roosting, and by their devilish device succeed in wringing the necks of bushels! Is this sportsman-like? Moreover, what is the consequence? Well—um—pretty much the only variety of food the people have now is *blue-fish*; wild fowl are scarce.

The "FOREST AND STREAM" is eminently practical. It deals in hard facts, and will not be gingerly in their application. From our experience we gather data; for our advice we give our reasons; for our opinions we have natural causes and established rules. There are children in woodcraft as well as in orthography, and it shall be our endeavor to make our instruction so simple that "he who runs may read" and that he who reads may also run.

Now as to the use of hounds, to which in some localities objection is made, we can only say that the arguments in its favor fully balance those against it. For ourselves, we should be loth to forego the music of "bell-mouthed hound." It gives life and passion to the chase and a choice companionship to the man who loves his dogs and likes to study their nature.

There is very little bird shooting yet to speak of. Some gentlemen have had the satisfaction of knocking over an occasional godwit or a few bay birds, but the sport is slow. Everywhere in the vicinity of New York our friends have tried it for two weeks past—at Rougher's Bar and the swamps of Carnarsie Bay, at Gravesend, Rockaway, and Shinnecock, and at all the favorite resorts of Long Island and contiguous New Jersey. The ten days of wet weather has been discomfiting to both birds and sportsmen.

About the middle of August, the Esquimaux Curlew arrives on the Labrador coast from its more Northern breed-

ing grounds in immense numbers, flying very swiftly in flocks of great extent. These immediately break up into smaller companies, and proceed at once in search of food. They remain but a very short time. As Audubon most correctly says, "I was not long in discovering that their stay on the coast was occasioned solely by the density of the mists, and the heavy gales that already gave intimation of the approaching close of the summer; for whenever the weather cleared up a little, thousands of them set off and steered in straight course across the broad Gulf of St. Lawrence. On the contrary, when the wind was high and the fog thick, they flew swiftly and low over the rocky surface of the country, as if bewildered. Whenever there was a spot that seemed likely to afford a supply of food, there the Curlews abounded and were easily approached." His observations, however, differ much from those of the writer in reference to the time of the arrival and departure of the birds. He states that they made their first appearance on the 29th of July, and had all left by the 12th of August; whereas, from our experience none came until about the latter date, and none were to be seen on the first of September. For two or three days before their final departure, they began moving directly southward, flying very high in the air in loose straggling flocks, with a broad extended front.

The Curlews associate in flocks of every size, from three to as many thousands, but they generally fly in so loose and straggling a manner, that it is rare to kill more than a half a dozen at a shot. When they wheel, however, in any of their many beautiful evolutions, they close together in a more compact body, and offer a more favorable opportunity for the gunner. Their flight is firm, direct, very swift, when necessary much protracted, and is performed with rapid regular beats. They never sail except when about to alight; then the wings are much incurved downwards, in the manner of most Waders. As their feet touch the ground their long, pointed wings are raised over the back until the tips almost touch, and then deliberately folded, much in the manner of the Solitary Sandpiper, *Rhyacophilus solitarius*. Their note is an oft-repeated, soft, mellow, though clear whistle, which may be easily imitated. By this means they can readily be decoyed within shot, if the imitation is good and the gunner is careful to keep concealed. The smaller the flock, the more easily are they allured, and a single individual rarely fails to turn his course toward the spot from whence the sound proceeds. When in very extensive flocks they have a note which, when uttered by the whole number, we can compare to nothing but the chattering of a flock of blackbirds. When wounded and taken in hand, they emit a very loud harsh scream, like that of a common hen under similar circumstances, which cry they also utter when pursued.

Their food consists almost entirely of the Crow-berry, *Empetrum nigrum*, which grows on all the hill-sides in astonishing profusion. It is also called the "Bear-berry" and "Curlew-berry." It is a small berry, of a deep purple color, almost black, growing upon a procumbent, running kind of heath, the foliage of which has a peculiar moss-like appearance. This is their principal and favorite food; and the whole intestine, the vent, legs, bill, throat, and even the plumage are more or less stained with the deep purple juice. They are also very fond of a species of small snail, that adheres to the rocks in immense quantities, to procure which they frequent the land-washes at low tide. Food being so abundant, and so easily obtained, they become excessively fat. In this condition they are most delicious eating, being tender, juicy, and finely flavored; but as might be expected, they prove a very difficult job for the taxidermist.

Although the Curlews were in such vast numbers, we did not find them so tame as might be expected, and as we had been led to suppose by previous representations. We were never able to walk openly within shooting distance of a flock, though told it was often done. The most successful method of obtaining them is to take such a position as they will probably fly over in passing from one feeding ground to another; they may then be shot with ease, as they rarely fly high at such times. The pertinacity with which they cling to certain feeding grounds, even when much molested, we saw strikingly illustrated on one occasion. The tide was rising and about to flood a muddy flat of perhaps an acre in extent, where their favorite snails were in vast quantities. Although six or eight gunners were stationed on the spot, and kept up a continual round of firing upon the poor birds, they continued to fly distractedly about over our heads, notwithstanding the numbers that every moment fell. They seemed in terror lest they should lose their accustomed fare of snails that day. On another occasion, when the birds had been so harrassed for several hours as to deprive them of all opportunity of feeding, great numbers of them retired to a very small island, or rather a large pile of rocks, a few hundred yards from the shore, covered with sea weed, and, of course, with snails. Flock after flock alighted on it, till it was completely covered with the birds, which there, in perfect safety, obtained their morning meal.

We were told that the Curlews were never seen in Labrador, except for the short period in the autumn. Such, however, we do not think to be the case, particularly as Audubon, upon good authority, asserts to the contrary. It is probable that the certainty and silence with which it passes northward during the spring migration, causes it to be partially overlooked. Its migrations are very extensive, but performed so quickly and silently that it is rarely seen south of the New England States. It is found in Texas; though

as far as our knowledge extends, it does not breed much south of Hudson's Bay. In Labrador it is known by its proper name, which, however, is invariably shortened into "C'lew." Further south it is called the "Dough-bird," but this name is also applied to other birds. In a great number of specimens we found considerable difference in size, in the color of the under parts, which varies from creamy white to deep buff, and in the purity and extent of the white patch on the throat. These differences, however, were not indicative of sex, nor even of age, so far as we could ascertain.

—The legal season for shooting rail, and reed birds, and pheasants in Pennsylvania, will open on the first of September. Those who kill a pheasant out of season are liable to a fine of \$10 and costs for each bird, and \$5 and costs for each rail and reed bird so shot.

—There are over ten rifle clubs at present in Connecticut, the principal ones being in Hartford, Bridgeport, New Haven, Meriden and New Britain, and a general State Association has been formed. A grand rifle match will be held this fall at Meriden.

—Squirrel-shooting is now at its height in Pennsylvania. The young animals are now fat and tender, and the sport of hunting them is very exciting. With a good squirrel-dog in tall forests where the animals are known to abound, the sport is truly enjoyable and not unworthy the attention of any one who seeks good hunting and is a good shot, for squirreling tries the skill of the sportsman as much as any other. Those shot are red and grey squirrels.

—On Saturday last, sixty members of the National Rifle Association met at Creedmoor. Various sweepstakes were shot for. The most notable feature of the shooting was a contest between members of the 22d and 84th regiments, which was won by Mr. Becker, of the 22d, who made the remarkably fine score of 16 at 200 yards, and of 18 at 500 yards.

—In England the gun club is in a most prosperous condition, having over three hundred members. Among many notable matches which have been shot at Trotting Hill lately, we notice a contest between Mr. H. S. Jaffray, of New York, and Mr. Herbert Wood, at fifty birds each *forty yards rise*, which Mr. Jaffray won by one bird, killing seventeen, Mr. Wood sixteen. As the usual distance is from twenty-one to twenty-five yards, this is very remarkable shooting. At Brighton, with five birds, twenty-seven yards rise, Mr. A. Patten, with a central fire breech loader, killed four birds, and on a tie, won by killing three straight birds. American sportsmen should remember that the Bluerock is quite a different bird from our pigeon, and is a much swifter flyer. We understand that a strenuous effort will be made here to introduce this breed of bird.

—We have received from D. H. Smith, Esq., the Secretary of the Rifle Association of St. John, N. B., the following letter:—

ST. JOHN, New Brunswick, August 18, 1873.

EDITOR FOREST AND STREAM:—

I have been trying for some time to ascertain the magnitude and status of your rifle associations, and especially that which has its meetings at Creedmoor, L. I. I am Secretary and Treasurer of our county association, and a member of the Provincial body, and have often thought that while we send our men to Wimbledon it would be advisable to cultivate that friendship and fraternity which should exist between the marksmen of the United States and Canada. Could you place me in communication with the managers in order that some scheme for an international match might be arranged?

On referring this matter to the American Rifle Club we were favored by an immediate reply from the Secretary, J. P. Fairbanks, Esq. In his letter, dated August 23d, he expresses his desire to communicate with the representatives of the St. John's Rifle Club, and he states therein "It is contemplated offering prizes to all comers on October 8th, and that a most cordial welcome will be extended to Canadian riflemen." This is as it should be, and we are only too glad if the services of the FOREST AND STREAM may be of avail in bringing on a friendly contest between Canada and the United States at Creedmoor. American marksmen should remember that Canadian riflemen are adepts, having already won several prizes at Wimbledon, when pitted against the strongest English teams, and in a contest of this character they are likely to meet foemen worthy of their steel.

In Japan it takes five years for the tea shrub to mature, though a crop is made the third year. No tree is allowed to reach more than five feet in height, and the older the plant the more it is esteemed. Those trees which produce the very choicest teas, used only by the Princes, worth five dollars a pound, is the product of trees said to be 500 years old.

We all know about the fable of the ant and the cricket, and how the ant is supposed to make his granary in summer for his winter's repast. Whether or not the ant has a provident instinct seems yet quite undecided, and English and Continental savants are fighting over the question. As the ant is, according to some of his observers, torpid during the winter, what use has he for a winter's store. Let us immediately then alter the fable.

Shooting swallows with a bullet, from a rifle, or knocking down bumblebees with a pistol ball are sometimes talked about. Robert Houdin the famous French prestidigitateur used to do this. This was the way it was managed. The pretended bullets were made of hollow wax, covered with lead dust, and inside was the shot. Of course there was nothing very difficult in bringing down small game by this method.

Sea and River Fishing.

GAME FISH IN SEASON IN SEPTEMBER.

Bluefish, (*Temnodon saltator*.) Striped Bass, (*Labrax lineatus*.)
Land-locked Salmon, (*salmo Gloveri*.) Black Bass, (*Centrarchus fasciatus*.)
Trout, (*Salmo fontinalis*.) Maskinonge.

With the advent of autumn the Salmon family pass off the stage as fish in season, and with local exceptions, are preparing for their work of propagation. Nevertheless the legal limit in the Lower Provinces for salmon and trout is the 15th September, and for trout in the State of New York, the same date. In many States the close season does not begin until October.

Black bass fishing is now in its prime. The range of this fish and the number of places in which to take it, have been much extended by the efforts of the Fishery Commissions of several States, although some of the Commissioners seem to have a prejudice against its universal introduction. This is one of the gamiest fish in our waters, and by some anglers is preferred to the trout on fine tackle. For ourselves we give the bass preference over the rather sluggish speckled trout that are taken in ponds and lakes. Lake Simcoe, Belleville, Nipissing, and indeed the whole extent of the Province of Ontario, afford superb black bass fishing. The St. Lawrence river through the Thousand Islands, the lower tier of the Adirondack lakes, the great lakes of Western New York, and especially the lakes of Wisconsin and Minnesota, are favorite resorts of this fine fish. He takes a fly readily, and is greedy for "spoon victuals." The usual method of capture is to troll with a spoon, but by it one-half of the pleasure which the fly affords is lost. A medium sized spoon is needed, and if a fly be used a mixture of red and white feathers on a salmon hook will kill most every time. Brownish flies are used of several patterns, but a mixture of gaudy colors seem always requisite. An economical and killing "fly" can be made from the nethermost part of an old flannel shirt.

The striped bass of the ocean, like his namesake, is in full season now, and from this time on all through September and into October, the sport will be at its height.

During the past six weeks heavy scores have been made along the eastern shore. The Squidnotet Club, from June 20th to August 6th, footed up a total of 1,800 pounds with a 56-pounder for their heaviest trophy. The run was from thirteen pounds upward.

At "No Man's Land," near Martha's Vineyard, the fishing has been poor thus far in consequence of a wreck having gone ashore there on a clay bottom. She obstinately refuses to go to pieces, and the swash of the waves alternately upon her staunch old sides, and upon the bottom, beclouds the water with a milky hue that keeps the fish away.

At Gay Head, if the wind is southeasterly, so that it blows from Cuttyhunk, the fishing is also spoiled by this same washing of the white clay bottom; but there are one or two points along shore known to old fishermen only, where good sport can be had when the wind is from the northward. The lighthouse keeper at Gay Head is always glad to entertain anglers.

Niantic, near New London, was formerly a remarkable ground for bass fishing, as much as 10,000 pounds of fish having been taken there in a single season with the line. The Niantic river, two-and-a-half miles long, connects the bay with a lake which receives the waters of several fine trout streams, so that the river and bay form a natural breeding and spawning ground for bass. A number of elegant villas line the river and sea-beach. There are two hotels, one at Block Point on the East Lyme side, and the other on the opposite side of the river at Bloody Point. Niantic Bay is three miles wide, and has a depth of three fathoms. In the channel below the railroad bridge, it is five fathoms, and here is the place to throw for bass. Striped Bass have been biting freely for the past two weeks about the islands and grassy shallows of Hell Gate and Harlem River.

Philadelphians have got to trolling for bluefish by steam. One of them who returned from Providence to Philadelphia last week in one of the Clyde steamships, tells us that they trolled for bluefish and bonita along the Long Island and Jersey coasts while the steamer was under full headway. Owing to the extra resistance the hooks were often torn from the fishes' mouths; but enough were caught to bountifully supply the table. Shade of Walton, defend us from such innovations!

There are no less than eleven islands in Alexandria Bay (St. Lawrence river) occupied by private villas. The finest of these island cottages is that of Hon. E. K. Hart, of Albion. It is a Swiss cottage, sixty by seventy feet, with a tower rising eighty-five feet above the level of the river, and cost about twelve thousand dollars.

The Germantown *Telegraph* says that the Pennsylvania Fish Commissioners will not erect more than one of the four fishways in the Susquehanna and tributaries this season, and even this one (in the Columbia dam) may be resisted by the Reading Railroad Company who are lessees of the Susquehanna Canal Company. The Railway Company may interpose objections to the erection of fishways in the Columbia dam, but that cannot hinder the work going on, and is probably intended as a basis for damages from the Canal Company, should the said ways prove injurious.

The stocking of the Vermont waters with salmon promises to be a success. Several small ones placed in the Winooski River have grown two or three inches since last summer.

RULES FOR FISHERMEN.—The following excellent rules are attributed to Rev. Henry Ward Beecher:—

First—Find out if there is any fish in the river to which you are going; if so, get some one who knows the water to show you where the fish lie; and when he shows them to you don't you show yourself to them.

Second—Don't imagine if the fish does not dart away that he has not seen you; on the contrary, he is very likely devoting his whole attention to you, and preparing to start the moment danger is imminent.

Third—If you are fishing with a fly, and you pass it neatly three times over him, and he refuses it, you need not wait any longer; he has seen your line of invitation and does not intend to come.

Fourth—If you are above a fish when you hook him, get below him as soon as you can, for if you pull him one instant against the stream, and he is a heavy fish, he will break his hold.

Fifth—Never throw a long line when a short one will answer.

Sixth—Never mind what is said about "playing your fish till he is tired;" put him in your basket as soon as you can.

Seventh—Remember that everything depends upon the way you begin your acquaintance. If you can prevail on a fish to go down the stream a little way with you, you will afterward have no difficulty in persuading him to let you have the pleasure of seeing him to dinner.

To these excellent maxims I beg leave to add one of Mr. Stoddart's, especially intended for bachelors, young and old: "*Never fall in love with a woman by the waterside; there are situations in which every woman looks an angel.*"

Paul Smith, St. Regis Lake, Adirondacks, has this summer added billiard and bath rooms to his other recent "modern improvements." Ex-Governor Fenton and the Vice Consul for Italy are among his guests. The house is chock full and rooms at a premium. The fishing in the Adirondacks has been better this year than ever before. We regret to say that an unusual quantity of deer have been killed. We shall give these deer slayers "goss" when we are appointed Grand Forester of the new York State Park.

A correspondent who has just returned from Moosehead Lake, in Maine, says the most desirable way of reaching the lake is to purchase an excursion ticket at the office in Boston via the Eastern railroad to Portland, thence by Maine Central to Dexter, and thence by stage thirty-six miles to Lake, and return—cost \$15. June and September are the best months for fishing the lake, but the adjacent ponds whose outlets empty into the Moosehead, are the best in July and August. Spencer Pond is a good ground. The largest speckled trout caught weighed four pounds. The brown hackle with red body and the scarlet ibis seemed the most killing flies to use. A guide and canoe cost three dollars per day, and a sail boat three dollars per day, to be procured at Greenville, foot of the lake. Frank Vaugh is recommended as a guide.

Art and the Drama.

The second marked event of the opening of the fall season, in matters dramatic, is the production of Midsummer Night's Dream at the Grand Opera House. This play has often been pronounced beyond the capabilities of the stage to adequately meet the requirements of scenery and acting. We now have at the Grand Opera a marked attempt to realize the ideal creations of "fairy land," and from a scenic point of view, it is a great success—just such a kind of success, that fills Niblo's Garden with admirers of the Black Crook; but those theatrical people, who are only charmed with the surface, at the Grand Opera House find the inspired language of Shakspeare, instead of the maudlin stuff of the Crook, and they are dissatisfied. There is no use to disguise the fact that an attempt has been made in the revival of this play to attract an audience by the presumed splendor of scenery, the text being merely used as a reason for "gorgeous transformations" and "fairy dells." The acting indeed is so subordinated to meretricious display, that it becomes merely a "gap" to give the scene shifters time to play their more important part, and Fox of Humpty Dumpty fame, the thoughtless press congratulates, as the great source of the intellectual interest of the performance.

Theatricals have certainly a downward tendency and they seemingly begin to reach the bottom, when Shakspeare is absolutely smuggled before a New York audience and attempted to be forced down unwilling throats, just as nauseous medicine is made palatable by the thick coating of the crystalized juice of the sugar cane.

But the manager had one resource entirely in his power, viz., the reason for producing in perfection Mendelssohn's incomparable music. But here again the want of faith in the modern theatrical manager in anything intrinsically excellent, comes in, and we are denied the only intellectual luxury that Mr. Daly could give us in perfection. It is certainly to be deplored that the entire managerial taste and capital should be directed with such prodigality on that which alone appeals to the senses through the eye, to such an extent indeed, that the intellect is even denied the charm of sweet music set in accord by an inspired mind. Mendelssohn's music dazzles the imagination of the listening world far more than the varied brilliancy of gas lighted canvases however gorgeous. Had some of the prodigal waste of money expended upon this pageant been appropriated to training and paying a skillful orchestra, capable of discoursing correctly his most wonderful music, and with something of the passion, *finesse*, and playfulness intended by that master mind, then Midsummer Night's Dream would have offered an attraction that alone would have sufficed to draw thousands of our music loving public.

Our Teutonic population is so immense, that it constitutes New York the third largest German city in the world, and our German friends crowd in with avidity, at every opportunity of hearing the compositions of favorites, provided the performers are properly drilled to give an effective rendering. Now there is a witchery and charm pervading the entire work of Mendelssohn's so rich in thought, so wealthy in detail, that in combination with the poetry and action, the enchantment would have been complete and the success assured—and there might have been a

run of many weeks and a realization of money made upon a legitimate representation of the highest and most intellectual dramatic performances. Instead of this—we have a failure—denied, but nevertheless announced in the fact, that the Midsummer Night's Dream is soon to be withdrawn for a newer and "more startling novelty of the Wandering Jew."

We hope the execrable taste that suggested the introduction of "California music" in place of Mendelssohn's to adorn Shakspeare, will soon cease its baleful influence in a city that should dictate, not receive, laws that control refinement and good taste.

—On Monday evening last the Lydia Thompson troupe commenced their fall engagement at the Olympic. The same evening the Opera Bouffe was presented at the Broadway, the piece selected being "La Fille de Madame Angot," the principal character by Mlle. Aimee.

—Salvini and Rainoute with their troupe are expected shortly; they were to sail the last week of August and appear at the Academy on the 15th proximo.

—The well known prima donna Mme. Van Zandt will play in St. Petersburg this week.

—A new training school for music is to be established in London, in connection with the Royal Albert Hall and under the auspices of the Society of Arts. Three hundred scholarships are to be founded, affording gratuitous instruction and free maintenance for students. It will be well when some of those charlatans, advertising their so-called conservatories here, will be supplanted by some such institution, that will bear more resemblance to the real thing than the *name*.

—The Grand Opera House advertises the Wandering Jew, (a new version), to succeed the present Shakspearean *pot pourri*.

—Mr. Finlay Finlayson, the popular baritone has just finished a simple little operetta for four voices without chorus, entitled "Mistress and Man." The plot by the same gentleman is comic, and music melodious, after the style of Balfe. A small orchestra places the work within the reach of small places, and any concert troupe can give it for an evening's entertainment.

—It is decided that the question of English opera is to be tried again in New York, with Miss Clara Louise Kellogg as prima donna. Mrs. Moulton's name has been mentioned in connection with Santley's. We shall give more information in our next number, as soon as something definite is permitted to be known.

—It is understood that Mme. Maskill will arrive from England shortly, as a rival in dramatic readings to Mrs. Scott Siddons.

STRANGE EFFECT OF TERROR ON ANTS.—In a late number of *Nature* there is an interesting letter from a Mr. J. D. Hague, of San Francisco, addressed to Charles Darwin, on the subject of ants, and the terror they are seized with on perceiving dead ants on their tracks. Mr. Darwin says:

"Mr. Moggridge tried this experiment with some ants at Mentone with similar effects. I therefore sent the letter to Mr. Hague, and asked him to observe whether his ants were alarmed by the smell left by the finger, or were really terrified by the sight of their dead and dying comrades. The case appears curious, as I believe no one has ever observed an invertebrate animal realizing danger by seeing the corpses of a fellow species. It is indeed very doubtful whether the higher animals can draw any such inferences from the sight, but I believe that every one who has had experience in trapping animals is convinced that those who have never been caught learn that a trap is dangerous by seeing others caught."

The Kwitchapak, or Yukon River, has its source far up in British America and up in the Rocky Mountains, and runs for hundreds of miles in British America, and then enters Russian America (Alaska), its course from the source to the centre of Russian America being Northwest, and enters into Behring's Sea at about North latitude sixty-three degrees.

History tells us that the width of this great river will average one mile for the distance of 1,800 miles in length, though in some places it is five miles in width. History further tells us that it is navigable for 1,800 miles, though a boat could not make more than one trip a year, as the river is open but three or four months of the year. In length and volume of water it is exceeded only by the Amazon, the Mississippi, and, perhaps, the La Plata. It exceeds the Nile, the Ganges, the Volga, the Amoor, and has affluents to which the Rhone and the Rhine are but brooks. The fisheries on the Amazon of the North are said to be the best in the world. Moose, reindeer, and hares abound on this great river. It costs the natives there but little exertion to procure their food.

W. H. Hollister, the wealthy stock raiser of Monterey County, Cal., left Ohio for the Golden State twenty years ago, driving with him eight hundred sheep. His neighbors thought he was insane to enter upon such a foolhardy undertaking; but he persisted, and after being a year upon the road and enduring all manner of hardships he finally reached California with three hundred sheep remaining out of his original flock. By care and good management each one of these three hundred sheep yielded \$1,000 before it died, or a total of \$300,000. This sum has since been increased to \$3,000,000, his estimated wealth at present.

—The Calcutta *Times of India*, states that a Cobra twenty-one feet long was killed by some Englishmen lately on the Padueuttah hills. The snake had the day before swallowed a native child.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

NEW YORK YACHT SQUADRON, August 21st.—The look of the weather gladdened the hearts of the Yachtmen, and towards nine A. M. a fresh breeze sprang up which indicated clear weather for the race for the Bennett cup. Mr. Centre kindly lent his sloop yacht Vindex for a stake boat, which was anchored near Fort Adams. The signal gun for preparation was fired from the stake boat at 9.59. The following yachts started.

YACHTS.	SCHOONERS.	OWNERS.
Alarm.....	Rear Com. Kingsland,	
Eva.....	E. Burd Grub.	
Foam.....	Sceppard Homan.	
Idler.....	S. J. Colgate.	
Josephine.....	Lloyd Phenix.	
Madleine.....	Jacob Voorhis, Jr.	
Madgie.....	R. F. Loper.	
Tidal Wave.....	W. Voorhis	
SLOOPS.		
Ariadne.....	T. A. Strong.	
Qui Vive.....	T. Clapham	
Vision.....	J. J. Alexander.	
Vixen.....	W. Garner.	

As the yachts prepared for action there seemed to have existed some difference of opinion as to the character of the wind outside. The Josephine was under ordinary cruising canvass while the Foam carried her club-main-top-sail and a working fore-top-sail aloft. The Vixen too showed plenty of extra canvass. The Tidal Wave was wary, on the watch, and only spread her usual sails. The Qui Vive carried a top-sail, as did the Idler; the Madeleine had both club top-sails set. At the start the Vision and Ariadne crossed the line first, the Foam shortly afterwards, and the Idler slightly to leeward; the place of the Madeleine was inside the Idler, and the Alarm to windward; Qui Vive on the weather quarter. The breeze was a ten knot one, the sea not too lumpy, and the yachts bowled along at a glorious speed, making for Point Judith. The Madeleine was now leading the fleet, followed by the Alarm half a mile astern; the Madgie was hugging the Alarm, and after her came the Tidal Wave. About 12 o'clock the Madeleine lowered her stay-sail, and took in her fore-top-sail. The breeze had now freshened, and the yachts were heading for Brenton's reef light-ship; the Madeleine turned the buoy at 11:59; the Tidal Wave crept ahead of the Alarm and kept the third place. The yachts were all doing their very best, and the Madeleine looked as if she would make the fastest time on record. It was evident that the race lay between the Madeleine, Tidal Wave, and Alarm; after passing Point Judith the breeze and sea quieted down, the Alarm gaining on the Tidal Wave, and looked as if she might become the rival of the Madeleine. Inside the white-washed rocks, the water being smooth, the Tidal Wave again crept ahead of the Alarm. The Madeleine came in winner about 250 yards ahead of the Tidal Wave, Madgie next, after her the Foam, the Madeleine making the fastest time on record; time 3h. 22m. 23sec.

AUGUST, 23.—The race for the Douglas cups. Course from Brenton's Reef light-ship to the Sow and Pigs light-ship and return. Distance 33 miles. Prize two \$500 cups; one for schooners, and one for sloops. The morning promised badly, there being scarcely any wind at all; there was a dead calm, and the water was as smooth as a mirror; a little after eleven o'clock there was the faintest ripple perceptible and the canvas commenced to flutter; it was 12:30 before the race began.

The yachts crossed the line in the following order: Qui Vive, Vision, Vixen, Madeleine, Alarm, Tidal Wave, Eva, and Idler.

The Madeline soon collared the sloops and now the Tidal Wave and Madeline are contesting for the lead. The Tidal Wave held her own for a short time when the beautiful Madeline passed her, and by one o'clock the Madeline is full one-third of a mile ahead of the fleet. Of the sloops, the Vision is ahead, pushed closely, however, by the Vixen. As they turn the light-ship it seems evident that the Madeline is again the winning schooner and that the Vision must beat the sloops. The Eva having lost her jib-boom before reaching the light-ship, abandoned the race; in fact an ugly squall had been threatening in the distance for the last hour, so that the slow ones seemed to stand a good chance of losing their top-hamper. The Madeline came in ahead and won the cup for schooners. The Vision secured the cup for sloops.

The Passaic Chubs of Newark, New Jersey, have accepted a challenge from the Triton Boat Club to row a six-oared shell race one mile and a half and return, on the Passaic river on September 3rd.

J. C. Dole, Jr., of Brunswick, and C. M. Henry of Portland, Maine, are matched to row a single scull race for \$250 a side, September 9th, in Portland Harbor, on condition that the water is smooth.

The three Wards, Ellis, Gil, Dan, with O'Leary, of Worcester, Mass., are to pull together in a four-oared boat, looking towards the rewards offered in the coming Wretham regatta.

The Toronto International Regatta takes place to-day. The Yacht races to-morrow are open to the Canadian Clubs only. There are five prizes to be contested for.

The Horse and the Course.

TABLE OF FASTEST TROTTING TIME.

We copy from *Harper's Monthly* the time of the fastest trotted single mile. Its convenient form will undoubtedly cause it to be frequently referred to. In the table Joe Elliott's time, 2:15½, was undoubtedly accomplished by the horse; but as his trial of speed was not made in the interest of a wager, according to turf law, it is not placed on record:—

TABLE SHOWING THE FASTEST TIME AT ONE MILE.

Name of Horse.	Min.	Date.	Course.	Mode.
Joe Elliott.....	2:15 1-2	June 29, 1872	Mystic Park.....	Harness.
Goldsmith Maid.....	2:16 1-4	June 19, 1872	Mystic Park.....	Harness.
Dexter.....	2:17 1-4	Aug. 14, 1867	Buffalo Park.....	Harness.
American Girl.....	2:17 1-4	Aug. 9, 1872	Buffalo Park.....	Harness.
Lady Thorne.....	2:18 1-2	Oct. 8, 1869	Narragansett Park..	Harness.
Lucy.....	2:18 1-4	Aug. 9, 1872	Buffalo Park.....	Harness.
George Palmer.....	2:19 1-4
Flora Temple.....	2:19 3-4	Oct. 15, 1859	Kalamazoo.....	Harness.
Henry.....	2:20 1-4	June 23, 1871	Beacon Park.....	Harness.
Mountain Boy.....	2:20 1-2	Harness.
General Butler.....	2:21
Rolla Gold-dust.....	2:21
Gazelle.....	2:21	Oct. 22, 1872	Prospect Park.....
Jay Gould.....	2:21 1-2	Aug. 7, 1872	Buffalo Park.....	Harness.
Camors.....	2:21 3-4	Sept. 19, 1872	Prospect Park.....	Harness.
Judge Fullerton.....	2:21 3-4	Oct. 4, 1872	Fleetwood.....	Harness.
George Wilkes.....	2:22
Princess.....	2:22
Rockingham.....	2:22 1-4	Saddle.
Rosalind.....	2:22 1-4
Geo. M. Patchen.....	2:22 1-2
Jenny.....	2:22 1-2
Lady Mand.....	2:22 1-2
Huntress.....	2:22 1-2	June 18, 1872	Mystic Park.....
Flora Belle.....	2:22 3-4
Kilburn Jim.....	2:23

CHURCH OF THE STRANGER, N. Y. August, 1873.
CHARLES HALLOCK, Esq.—

DEAR SIR:—I thank you for the first number of "FOREST AND STREAM." It is very beautiful, and, so far as I have read it, very good.

I am perhaps as far removed from a sportsman as any clergyman you ever knew. I have never caught a dozen fish in my life; never shot but one animal; never attended a horse-race; never was in the Adirondacks; and yet the amount of fun I have seen, if I had had nothing else in life, has been richly worth living for. Moreover, I am the very kind of a man to enjoy your paper. All the more because I have not time to do it, I want to see how it is done. So I intend to read "FOREST AND STREAM;" and you shall be my authority on these subjects. In the meantime, I can keep an eye on your "moral state," and whenever you break into any irregularities, I shall "rein" you into an orthodox gait.

Now at the very outset the functions of my chosen office are brought into requisition. You say in your very graphic announcement, "We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated with the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him."

It seems to me that is a very ill-considered paragraph. I know a little about horses, and I love them. I sometimes playfully tell my children that the name of the American branch of our family is not a contraction of the name of the Dutch branch, *De Heems*, but is simply a corruption of the English word Teams, because of our fondness for horses.

I do believe that a horse can become "contaminated," and I also believe that a horse can "contaminate" a man in the sense in which you use the word. The old idea of the Centaur did not, I think, arise in the mind of some savage upon seeing for the first a man on horseback and regarding the two animals as one. I am fain to fancy that some ancient philosopher of my school, ascertaining what a oneness can come to exist between a horse and his rider, projected his theory in the idea of the Centaur. You may take a horse of the very highest qualities and place upon him a man of the very lowest qualities, and at once there will begin to be an elevation of the man and a deterioration of the brute. So if you put on a rather inferior horse a rider who is every inch a man, physically, intellectually, and spiritually, the horse seems instinctively to recognise his rider, and rise as if under aspiration for higher equine qualities.

Just here comes the moral responsibility of the rider. If I were writing an essay instead of a rapid letter, I should run this out; and from all we could gather from the biographies of horses and their riders, from Alexander's Bucephalus down to Kaiser William's favorite charger, I think I could make out a case for the theory that the qualities of the horse are improved or deteriorated by those of his rider as the qualities of the rider are by those of his horse.

Proofs of the same proposition might be brought from the history of horse training in which kindness is known to be so much more powerful than muscular force. Indeed I think I have here the germ of a science which when developed will make the owners of a stud able to tell which of his servants has ridden such a one of his horses in his absence, by this knowledge of both his men and horses. All of which would go to show what a fine animal the horse is; and all of which does endear him to men that love the good wherever they find it.

It does not do to let every one ride your horse. The finest horse in America if hired day after day and hour after hour to Tom, Dick and Harry, or even Thomas, Richard and Henry, without regard to the qualities of the rider, would become so prostituted that a horseman of high qualities would shrink from having anything to do with him. I do believe that low and vulgar fellows, as grooms or riders or surrounders of a fine horse do by the moral atmosphere which they engender degrade the noble animal.

Wishing you great success in your enterprise,

I am truly yours,

CHARLES F. DEEMS.

KINGSTON, August 20.

There was a fair attendance at the fall meeting. The weather was fine and the track in good order.

First race, purse \$450, for three-minute horses. Four horses started, and the race was won by Gray Hawk in three straight heats. Time 2:47½, 2:50½, 2:49.

Second race, purse \$250, for horses that had never beaten 2:37. I. H. Chambers' Molsey won in the first, second and fifth heats.

August 24.—The races concluded on the 24th. Trot for \$300. Four horses started. Won by Mollie Smith in three straight heats.

WILKESBARRE, PA. August 20.

The Lee Park races opened this afternoon, the track was in excellent condition, and between three-and four thousand people were present. First race for the Lee cup and \$50. The race was won by Stickner's Billy.

Second race, purse \$500, for horses that had never beaten 2:54. Eighteen horses started. Bay gelding Daniels, owned by John S. Baker of Seneca Falls, won the race, taking the third, fourth and fifth heats in 2:39, 2:35, 2:34. The third race was for \$800, for horses that had never trotted better than 2:37. There were five starters. Dinah, of Philadelphia, won in three straight heats. Time, 2:40, 2:38, 2:36.

August 22.—The sun shone brilliantly and the track in good condition. Purse \$200, for horses that had never beaten three minutes. Ten entries, and eight horses started. Dick winning the fourth, fifth and sixth heats. Time, 2:42, 2:44, 2:54. Second race, purse \$500, for horses that had never beaten 2:46. Eleven entries, eight horses started. Mollie Clark won in three straight heats. Time, 2:37½, 2:35, 2:34. Third race, purse \$800. Five entries, four horses started. Tom Keeler won in three straight heats. Time, 2:30½, 2:30, 2:29.

HAMPDEN PARK RACES, SPRINGFIELD, MASS. August 20. There were eight thousand persons present, and the track was in a superb condition. First race, purse \$6,000, for horses that have never trotted better than 2:21. There were three starters, Judge Fullerton, Sensation, and Camors. Judge Fullerton broke badly at the start and could not be brought into subjection, being distanced the first heat, which was won by Sensation. Camors took the second heat, and Sensation the third and fourth. Time, 2:23½, 2:25½, 2:25, 2:23½.

Second race, purse \$4,000, for horses that had never beaten 2:31. Eight horses started and seven heats were trotted, leaving the race undecided, owing to the darkness. Ohio Boy won two heats, and Barney Kelley, Commodore, Winthrop Morrill, and Colonel Moulton one each. The fifth was a dead heat, five horses swinging under the wire on a run, neck and neck. Time, 2:34, 2:31½, 2:30, 2:33, (dead) 2:35½, 2:35.

August 23.—The first or 2:24 race was contested by Crown Prince, Confidence, Gloster, Susie, Hotspur, Major Allen and Thomas Jefferson. Gloster won the first two heats, and was second in the last two, and Susie was second in the first two, and first in the last three, winning the race. Thomas Jefferson won the third money. Time, 2:23, 2:25½, 2:25½, 2:27, 2:25.

August 24.—Fully 12,000 people were in attendance to witness the race for horses that had never beaten 2:24, for a purse of \$3,000 for the first horse and \$1,000 for the second. Four horses started, Susie, Gloster, Thomas Jefferson, and Hotspur. Won by Susie in the three last heats. Time, 2:25½, 2:27, 2:25.

Second race for the 2:38 class. Nine horses started; purse \$4,000; for the first horse, \$2,000; second horse, \$1,000. Won by Clementine in the three last heats. Time, 2:35, 2:30, 2:32½.

August 25.—Nearly twenty thousand people were present to witness the closing scenes in Hampden Park. The track was literally perfect. Purse \$4,000, for horses that had never beaten 2:29. Sixteen entries, and nine horses came to the post, Van Ness' St. James winning the first heat 2:26½, third, 2:25½, and fifth 2:29.

Second race. This was the great feature of the races. Purse \$6,000, open and free to all. Six entries: Henry, American Girl, Lulu, Lucy, Goldsmith Maid. Henry and Lucy were withdrawn, the other four coming to the post. Goldsmith Maid won in three straight heats: 2:21, 2:22, 2:19½.

Last race of the meeting, Purse \$6,000, open to all horses that had never trotted for premiums.

Dolly Varden first heat; Sparker second heat. Too dark to trot another heat.

LONG BRANCH EXTRA MEETING, MONMOUTH PARK, AUG. 23.—Hurdle race. Purse of \$600. Welter weights; to carry twenty-eight pounds overweight for age. Five starters. Two horses distanced. Won by Blind Tom; 1:59, 1:57½.

Second race, Long Branch. Handy-cap, H. F., with \$500 added; four horses started; won by Lightning; 2:20; distance, 1½ miles.

Third race for \$500, for two-year-olds. Two horses started; Norton won. Time, 1:22½.

Fourth race, \$600, for all ages, to carry one hundred pounds. Four horses started; Arizona won; 2:40; distance 1½ miles.

HAMILTON BUSHEY, Esq., in a comprehensive contribution to *Harper's Magazine*, supplemented by an article in the *New York Times*, is using his efforts to accomplish a sweeping reform in the morals and rules of the turf. His proprietary connection with the leading turf paper of the country gives a semi-official weight to his utterances. All gentlemen who esteem the horse as a companion, and value

his material services, will thank this gentleman for his efforts, and heartily second them. In the *FOREST AND STREAM* he will find an earnest coadjutor. After reviewing the efforts within the current year of the National Association, of which Amasa Sprague, of Providence, is President, and of the Trainer's and Driver's Protective Association, to improve the management of the turf, he makes the following just strictures upon the evil of pool-selling, which he properly regards as the great curse of the course. He says:—

"It weighs like an incubus on the turf. It affords the straight-laced an opportunity to declare that the chief end and aim of racing is gambling. It brings a noisy and unclean class into prominence. The chronic rogue and the brazen-faced swindler are inveterate pool-buyers. The sharpers combine to fleece the unsuspecting public whenever they can. They tamper with the horses and the drivers, and hesitate at nothing to accomplish their designs. The pool-box is responsible for three-fourths of the frauds which take place on the turf. The largest breeders and owners of horses do not haunt the pool-stand. As a rule, our most eminent breeders are not betting men. The men most benefited by pool-selling are sharpers, who make a business of following the horses from meeting to meeting. So long as pool-gambling is made a prominent and an offensive feature of the course, there are thousands of people of religious training who have a natural fondness for fast horseflesh, who will object to going themselves or to taking their families to view the races. We should enjoy sport for sport's sake, and not make it subservient to a gambling interest. The faint roar of the revolution, I am pleased to write, is heard. There is a strong movement to do away with the pool-stand, and as this movement is gaining strength all the while, its final success seems to be but a question of the future."

The same writer specifies the most prominent Trotting Parks in the country, which are the Buffalo, at Buffalo; Narragansett, at Providence, R. I.; Prospect, near Brooklyn; Fleetwood, near New York; Hamden, at Springfield, Mass.; Dexter, Chicago; Utica, at Utica, N. Y.; Herdic, at Williamsport, Penn.; Point Breeze, at Philadelphia, Beacon, at Boston, and the Buckeye, at Cincinnati. Almost every important town in the Northern States has its trotting course. In the Southern States the trotting course is not so popular, running races being more largely patronized there.

He also names the following celebrated breeding farms: Stonyford, in Orange county; Waldberg, near Haverstraw, on the Hudson; Thorndale, in Dutchess county; Spring Hill near Flushing, Long Island; The Home Farm, near Boston; Fairview, Woodburn, and Forest Park, in Kentucky. The strength of the prominent breeding establishments, averages from eighty to one hundred and twenty-five head of horses. At Waldberg as well as Stonyford the animals number 200. With from thirty to fifty brood mares constantly producing, the stables and paddocks would overflow were not the ranks thinned out by annual sales.

Mr. Busby's account of the long and fierce rivalry of Mr. Bonner and Mr. Vanderbilt is interesting. This rivalry began some fifteen years ago.

Whenever a promising horse was heard of the agents of Bonner and Vanderbilt were after him without delay. Mr. Bonner was the most wide-awake, and then he had the pluck to pay all sorts of prices. His first great triumph was in purchasing the celebrated Lantern. Next he purchased Lady Woodruff for the sum of \$3,300, the Lady and Lantern making a team hard to beat. Flatbush Maid was the next acquisition, the price paid for her being \$4,000. Lady Palmer was the fourth purchase, Mr. Bonner giving his check for \$5,000 for her. He had now two unrivaled double teams. Commodore Vanderbilt was not idle all this while. He sought for good horses but was not as successful as the newspaper man in making acquisitions to his stable. The Commodore nevertheless boldly asserted that he was ready at any time to match his team against Mr. Bonner's for \$10,000 a side, owners to drive. But Mr. Bonner, although passionately fond of fast horses, would not bet or trot for money. He had conscientious scruples against anything that looked like gambling; and no taunts could drive him from his position. In August, 1862, he drove over to the Fashion Course, with Flatbush Maid and Lady Palmer. It was a public race-day, and the grand stand was full of people. Among those present was Commodore Vanderbilt. Mr. Bonner determined to prove to his rival the mettle of his pair. He drove on the track, and requested several gentlemen, the Commodore especially, to hold their watches while he made a trial. The challenge was immediately accepted. The mares started at the word, and they trotted with remarkable steadiness, finishing two miles without skip or break in the unparalleled time of 5:01½, the last mile was done in 2:23½. It was a great performance, and very naturally Mr. Bonner was much elated. On returning to the judges stand with his horses he stood up in his wagon and proclaiming to the hearing of all that while it was a rule with him never to make a bet, he would present \$10,000 as a gift to any gentleman who owned a team if he would drive them in the time just recorded by Lady Palmer and Flatbush Maid. Everybody knew that this was meant for Vanderbilt, and it readily can be imagined that the challenge was not calculated to act as oil poured on troubled water. It excited the Commodore, and made the rivalry more intense. The years went by, and Vanderbilt made a bold attempt to turn the *Ledger* flank by purchasing the famous Mountain Boy. Bonner rose equal to the occasion. He purchased Dexter, and was invincible. Finding that the Commodore thought so much of Mountain Boy, Bonner took his rival by surprise in the purchase of Edward Everett, the sire of Vanderbilt's horse. The *Ledger* man now blandly smiled when he explained that he owned the stallion which begot the horse which the Commodore claimed was the best in the world. It cost Mr. Bonner twenty thousand dollars to indulge in this pleasant little boast. Vanderbilt has given up the fight at last. He still takes pleasure in driving on the road, but his Mountain Boy is dead, and the blood of the old man is tamer than it once was.

We quote from the *New York Tribune* this sketch of a Kentucky horseman and a medium:

"Some years ago it seems that Mr. McGrath got quite in-

terested in spiritualism. There wasn't much racing going on, so he could give the subject his undivided attention. He invited a friend to go with him and see Foster—or some other circulating medium—and my friend went. But he told me that it surprised him very much to see Mr. McGrath slip a full deck of cards in his coat pocket before starting. It scarcely seemed possible that Mr. McGrath intended to propose a game of spiritual seven-up, or to attempt to beat some unhappy ghost out of every rap he had at draw-poker—which is supposed to be an emphatically blue-grass game. Well, away they sailed, and found Foster in. I found him out at once, immediately after finding him in. Foster gave them his usual circus, and Mr. McGrath sat it through in solemn awe and silence. Sometimes a shade of impatience was visible, but his face looked radiant at the conclusion. 'Mr. Foster,' he said, as he laid the usual honorarium down on the table, 'this is wonderful, and you deal a square game, you do, I believe. But there's just one thing more I want you to try, and if you do it, and I don't give you just the best farm in Kentucky, my name ain't Price McGrath,' and down went his hands into his coat pocket and out he fished the pack of cards. 'There,' giving them a scientific blue-grass shuffle, and slapping them down on the table backs up. 'You just tell me what the first card is without turning it over,' and his breath came slow in expectation, Price McGrath's did. Foster couldn't, and Mr. McGrath turned sadly away, leaving the cards behind him in his bitter disappointment. 'If Foster could just a-told me what that card was,' he said to my friend as they slowly walked up Broadway, 'I'd just made our everlasting fortune. I'd a-taken him with me, and we'd a-busted every faro bank in the country. And then if I wouldn't a-made their hair curl at Baden-Baden and Monaco, I'll be Dee-Deed.' Mr. McGrath always says he'll be Dee-Deed when he feels solemn and wants to round a sentence handsomely.

Military News.

The news from the army this week is almost entirely savage in character, and those in sympathy with the Peace Commission policy will now perhaps see their error. The month of August has been one series of Indian fights, and the fate of the Modocs, and the utmost exertions of the Peace Commissioners have not in the least interfered with the sportive nature of our savage friends. There is one consolation, however, a few have been laid "lo," but not altogether by the hand or arms of the army, but by those of their own kind, as witnessed in the desperate fight between the Sioux and Pawnee tribes, which took place the first of the month within one hundred and twenty miles of the city of Grand Island, Nebraska. These two tribes have long been bitter in their hatred, and the younger portion of the Sioux tribe have patiently waited an opportunity to "get even" with the Pawnees, and were this time anxious to be on the offensive. Therefore, when, on the morning of the 2d of August, a Sioux Indian scout came into camp and reported the Pawnees as camping on the Ree fork of the Republican river, the Sioux camp became greatly excited, and "Little Wound" asked the Indian agent in charge if he had any orders which would interfere with his attacking them, and was informed that he had not. The Indian agent endeavored to pacify the excited Sioux, and offered to go with him and see the Pawnees, but to no purpose. The young men of the Sioux tribe considering that now was the "accepted time," while the Pawnees were off their reservation and away from white men. The following morning the Sioux warriors started for the camp of their adversary, which they reached in two days, meanwhile being joined by the Brules. On the morning of the 4th they made a desperate attack on the Pawnee camp, killing between fifty and one hundred, mainly women and children. At the time of the attack the greater part of the Pawnee men were absent hunting, so that despite a brave resistance, the Pawnees were overpowered, the attacking tribe numbering between five and six hundred. This fight was a perfect slaughter of Indian innocents, and will be the means of destroying the peaceful overtures made by the Government agents, a council of the chiefs having been arranged to convene this fall to establish a permanent peace between the two tribes. The Pawnees were on their annual hunt on the waters of the Republican, and had killed many buffalo, and secured much game. But the return of the huntsmen was made sad by the destruction of their camp and the killing of their squaws and papooses who were thrown in heaps and in some instances burned. The fight was thoroughly Indian in its savage nature, and we trust the "young men" of the Sioux persuasion are now "square" with their old foe. This fight, however, and its ruthless character, has aroused the worse feelings of the Pawnees, who probably before this have planned an attack on the Sioux tribe. Our troops in almost every direction find the Indians as usual thieving and treacherous and without the least idea of ever keeping their promises. The attempt to secure a notorious thief and murderer named Sancha, of the Southern Apache tribe, in New Mexico, by Captain Chilson's command, of the Eighth Cavalry, was recently resisted, although the chief had promised to aid in his arrest. But when the Indian agent attempted to take him at the reservation, he was surrounded by about thirty Indians, and the chief refused to allow his arrest. The Apaches then talked "much" fight to the soldiers, but the little squad, valuing their hair too highly, refused.

These very Indians are supported in idleness by the Government, furnished food, clothes, etc., and at the same time are allowed to steal and murder, while off the reservation, at will. The Government is at the expense of keeping troops all over the Indian country, who, when they are not fighting, are largely used in protecting those who wish to "talk," or hold a council with the savages whose promises are mere ropes of sand. Our army is small, it is true, but we would

not actually require one half as large, were it not for the constant depredations of the great American Indian.

General Irving McDowell, the intelligent commander of the Department of the South, is at present sojourning at Newport, where his family has a cottage. Few officers of the army are more generally respected than the first commander of the army of the Potomac. It was a glorious and a well deserved tribute when, some few years since, his comrades at the meeting of the Army of the Potomac Association relieved him from all responsibility for the defeat of that army at the first Bull Run.

The social intercourse between the officers of the United States service and those of England is more cordial than any other nations. Why should it not be so? Do they not speak our own tongue, is not England the "mother country," even if we are termed "American cousins."

First Lieutenant Asa Bird Gardner, of the First Artillery, has been appointed a Judge Advocate of the army, vice Major and Brevet Lt. Colonel De Witt Clinton, who died at St. Paul, Minn., August 13. Maj. Gardner at the time of the appointment was acting as aid on the staff of the commander of the Division and Department of the South, and has filled most acceptably recently the position of Acting Assistant Adjutant General of the Division. During his service in the army since 1868, his time has been mainly devoted to the duties of the judge advocate's office, and in numerous instances his superior knowledge of military law in all its branches has brought him in contact with, and in defense of, important governmental cases. His services are invaluable to the Government and the army, and the promotion to the rank, and particularly the *pay* of a Major of Cavalry is very acceptable in these dull times. It would have taken Major Gardner perhaps twenty-five years to have attained this rank by way of regular promotion.

Early in the winter the War Department will issue a revised edition of Upton's Tactics, as prepared by the board appointed some time since. The new tactics will combine the movements of the three arms of the service, and will undoubtedly be the newest military thing out.

Probably most of the West Point graduates know the returned bugler Benz, a German who has been in service at the Academy for the past forty years, and is therefore known by nearly every officer in the army, as his position, that of cadet bugler has brought him in contact with nearly every cadet who has been at the Academy during this period. A great many stories are related of Benz's experience with the cadets, among them the following:

When President Grant was a cadet at the Academy, learning the art of war, he one day sent Benz to the store to purchase fifty cents worth of Cavendish. Benz, however, in his haste did not hear correctly, but thought the order was candies, and accordingly invested the fifty cents in the toothsome article. On returning and handing over his purchase to Grant, the latter became angry at the ridiculous mistake and spoke rather sharply to Benz, who in turn feeling his old age insulted replied, "I don't doubt but what you will be President of the United States yet if you keep on." Grant turned at once towards Benz and laughingly said, "Well Benz, if I do I shall appoint you my Secretary of War." Doubtless the cadets who were standing near at the time this occurred well remember the incident. Events have shown, however, that President Grant has failed to fulfill his promise, and Benz of course has always been *too modest* to even ask for the appointment, thinking no doubt, that blowing his own bugle is much better than running the War Department.

Whenever General Sherman visits the Academy, he always has a kindly word for the old man, and has many times offered him a better position, but Benz would rather pass his remaining days where he passed his youth. He still blows the bugle, almost as well he did forty years ago.

The battalions of the Eighth and Ninth Infantry, with the Yellowstone expedition, have been ordered to be relieved. Company C, Sixth Infantry, was also ordered to be relieved and to return and be posted at Fort Buford.

Captain Anson Mills, of the Third Cavalry, escorting the Yale College exploring party under Prof. Marsh, in Nebraska, at latest report had not met with any Indians and did not anticipate any trouble. They had no desire to make the acquaintance of Mr. Lo!

The Tenth Cavalry has some highly colored stories to relate regarding its adventures in Texas and the Indian country.

Lt. Col. A. Montgomery, D. Q. M. G., is to be relieved from duty at headquarters of the Military Division of the East, New York, and will take Post No. 30, in the Department of Arizona, as Chief Quartermaster.

Colonel Orlando B. Willcox, of the Twelfth Infantry, has been detailed to assume control of the general recruiting depot, New York city.

Second Lt. Gilbert P. Colton, of the First Artillery, has been detailed as Professor of Military Science and Tactics at the Pennsylvania Military Academy, Chester, Pa. The First Artillery contains many of the "shining lights" of the service.

The oldest American skull is one found at New Madrid, Missouri, and it must have belonged to a contemporary of the mound diggers. It came from a depth of thirty feet below the surface of a mound, on which were growing the oldest trees of the primitive forest. Near it were discovered the relics of a mastodon. Anthropologists have decided that it must have belonged to a very beautiful woman.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

OLD ROME AND NEW ITALY. By Emilio Castelear. Translated by Mrs. Arnold. New York. Harper & Brothers.

One of the most interesting places from which to write a book of information upon a subject upon which scarcely any two persons agree in impressions received upon the spot, is this same old Rome. The author of this work is unquestionably something of a politician; he has also his own religious opinions, and hesitates not to fearlessly express them. His work shows him to be more of a scholar than a politician. His has been, therefore, by no means an idle life; his hours of leisure, if leisure they could be called, have been spent among stormy events. Taking quite a prominent part in the revolution, to quell which Sewano took the field in person, he was so unfortunate as to be taken prisoner, and was one of those who were condemned to death. From this fate he escaped, and for two years lived in Geneva and Paris, making visits to Rome, Venice, Florence, and other Italian cities; and to his exile from Rome we are indebted for this timely and tersely written record of an enthusiastic man. We do not call it a book of travels, as it professes to be, but an emotional journal of matters and things as he saw them, and his impressions upon the same. The author would write a good Roman historical journal, for the minutest incident leaves its impress upon his mind. This is a very interesting book, and some portions of the work are truly graphic in description. We would like to make some extracts from the same, but the book is so good as a whole that we cannot think of doing it the injustice of quoting only short paragraphs from a work so interesting as "Old Rome and New Italy."

THE TRAPPER'S GUIDE. By S. Newhouse. New York. Mason, Baker & Pratt.

This is one of the books much wanted by every one who loves to hunt fur, fish or feathers, and who has not a germ within himself—an aspiration that leads him as an urchin, bare-legged, dirty and hungry, to the old mill-pond with an alder stick, a piece of twine and a hook attached to catch the "chubbs," as he calls them. The same innate love of sport induces him to crawl on his hands and knees—many rods it may be—to snare the rabbit or partridge (we have done it time and again). And then the gun. Oh! paradise of a boy in short clothes—a gun. "Only let me squib it off." How vividly those old boyhood's days do come up again before us. But we began to tell you about a book of information for "boys," and also for men; even those who have caught trout in the Adirondacks can learn a lesson on trapping and woodcraft perhaps they never yet knew. In this complete compendium, this *vide mecum* of the sportsman, you can find everything you want to know, from the killing of the skunk, without odoriferous accompaniment, to the bringing down of the antlered monarch of the forest—and all this, too, for the mere pittance of \$1 50. It is a book that every boy and every man wants.

I GO A FISHING. By W. C. Prime. New York. Harper & Brothers.

We are not of a querulous, fault-finding school; were we one of that school we would find fault with the title of this rare book upon angling, sports with the rod and gun, &c. But we like this title, "I go a Fishing," with its beautiful illustrations of pastoral life. We love the initiatory allusion to St. Peter, his mode of life, and to the beautiful lake of Genesee. We think it good to see the gospel in the woods and streams, as well as worship the true God beneath his leafy temple. "We see not even the bad taste in the title of this gem of piscatorial art that some critics (?) do. We are so constituted that we cannot. "A little learning is a dangerous thing." We believe any one will rise from the perusal of this work of W. C. Prime's a better instructed, happier, pleasanter man. Mr. Prime is a most devout lover of nature, an humble disciple of nature's God, and he talks to us even in his stories of the moor and stream like a wise mentor we follow not in vain. Through all the changing and varied moods, whether he rambles amid the deepening shades of the Adirondacks, or sits quietly beside the silver waters of Lake George, we find him the same charming, instructive, pleasant friend. He's in all places and at all times the same true lover of the high art piscatory; he knows the rod and gun. This author has the ability to write one of the most readable books upon an interesting subject, and why should he not have the liberty to call his book by whatever title he pleases? Every New England sportsman will accord to him this right, and welcome his very readable book as one of the sportsman's treasures.

OUTLINES OF MEN, WOMEN AND THINGS. By Mary Clemmer Ames. Riverside Press. Hurd & Houghton.

Mrs. Ames has what some would call an "awkward" habit of looking things square in the face. We like this, and can join with her in completely ignoring side issues. This book covers a wide range of topics of different character, but it does ample justice to all. It is a sincere, earnest work, in which the writer shows not only her earnestness of purpose, but hopefulness of ultimately doing her readers good. The style is lively, spirited, vivacious—never flippant or grovelling. Every one who reads this book (and may there be many) will acknowledge her open sincerity as a jewel not possessed by every writer of the day.

OLD NEW ENGLAND TRAITS. Edited by George Lunt. Hurd & Houghton. Riverside Press, Cambridge.

We seem to hear George Lunt talking to us as of old when we open this New England tract. It is one of those very pleasant conversational books that we do not feel inclined to lay aside after once having opened it until we have read to the very close. There is a complete fascination about this volume that holds every one—who has had the good fortune to know personally George Lunt—perfectly spellbound from chapter one to the end. He simply talks to you from the beginning to the end; but then George Lunt knows how to talk.

THE LAST POEMS OF ALICE AND PHEBE CARY. By Mary Clemmer Ames. Hurd & Houghton. Riverside Press, Cambridge.

This is one of the most pleasant, agreeable and chaste productions of these days. This memorial of the gifted sisters, Alice and Phoebe Cary, comes to us like a string of Orient pearls upon a golden thread. These are truly racy, life-like sketches of every-day life; yet how very natural, how true to the life. Who does not feel within himself an uprising aspiration, a heart throb, as it were, for the heavenly home after a perusal of these beautiful thoughts? The great, good and moral truths written within this book will live forever; there is within them the spirit of immortality. The last poems of Alice and Phoebe Cary will live in the memory of generations yet unborn.

HOUSEKEEPING AND HEALTHKEEPING. Vol. I., 12 mo., pp. 482. By Catherine Beecher Stowe. New York. Harper & Brothers.

Reader, did you ever rise from a bad dinner out of all sorts with everybody, yourself, and last, but not least, your dinner? We know you have; human nature is human nature the world over, whether we confess it or not. As long as men and women must eat, so long will the best treatises on the culinary art be readily sought. We heard a sensible lady once say "the way to keep men good natured was first to give them no room for grumbling in consequence of a bad dinner." More depends on this unpoetical idea than one would at first imagine. And in this valuable work before us we find article after article upon the science of good nature—"a good dinner," and how to prepare one. The fact is, Miss Beecher tells you all about it. Are you dyspeptic, read the last book on the manner of exercising those legions of devils who are boring holes into the head of the poor dyspeptic and torturing out his very life. In a word, this is one of the very best, if not the best, books published upon a subject that concerns everybody—the science of the true enjoyment of human life.

PROTECTION AGAINST FIRE. Hurd & Houghton. Riverside Press.

"Joseph Bird's book again!" says some querulous, fault-finding croaker, who would grumble if his dinner was not done to the very nicest point. Yes, Bird's book again; and this book you and every grumbler should read, particularly if you are not a believer in friendship of any kind. We do not expect you to be a believer in that most rare and valuable kind shared so deeply between Damon and Pythias, but we only ask of you a common sympathy, a kindred love for your fellows in their hours of deep tribulation. In those days when adversity knits one man's soul to the soul of his kindred it is like recreating a soul beneath the ribs of death, we well know, to try to imbue some men with the idea that such an anomaly as an humane man can really exist; that in this universal "hard scramble" for filthy lucre a man can have within his own breast the feeling of "humane kindness" for his fellow-man. Joseph Bird, the philanthropist, does not trade upon tears and suffering—he nobly strives to do all the good he can to his fellow-man, and that, too, without seeking ulterior advantage to himself. He is, and has been, for a long time an ardent and enthusiastic fire-fighter, and we truly regret that there are not more to be numbered to-day in this anti-fire brigade. We are glad to know that Mr. Bird's book sells, and what is better, by far, it is taking a strong hold upon the public mind as to the best means of arresting by the most scientific and approved means the progress of the devouring element.

A CONCORDANCE TO THE CONSTITUTION OF THE UNITED STATES OF AMERICA—with a classified index and questions for educational purposes: By Charles W. Stearns, M. D., New York: Mason, Baker & Pratt, Publishers, 142 Grand street.

In a government like ours, the acquirement of a familiar knowledge of the Constitution may be considered the duty of every citizen; and yet the ignorance of many, even of those elevated to official positions, of the principles and powers embraced in that instrument, is a subject of such notoriety as to cease to excite surprise. The object of this book is to present the constitution as a whole, and to summarize in an intelligible form, its clauses and phraseology, under appropriate heads, so that the idea embraced may be readily understood. The following subdivisions indicate the plan and the advantage of the book: 1—The People; 2—The Congress; 3—The President; 4—Public Justice; 5—The States; 6—Elections; 7—Offices; 8—Military Affairs; 9—Foreign Affairs; 10—Maritime Affairs; 11—Commerce; 12—The Treasury. To this is added an alphabetical concordance, and a brief series of questions for learners. The work embraces 150 octavo pages, on beautiful paper, and is handsomely bound in cloth.

THE MINISTRY WE NEED. B. S. Sweetser. Hurd & Houghton. Riverside Press.

We have seen no book that seems to meet a want of the times more than this little, unpretending treatise. It will be a welcome guest in every Christian family. It is the ministry we need. It is purely English in style, is earnest, thoughtful, chaste, and, throughout the whole, of an elevating and improving high-toned morality.

BOOKS RECEIVED.

PREHISTORIC RACES OF THE UNITED STATES OF AMERICA. By J. W. Foster, L.L.D. Chicago: S. C. Griggs & Co. 1873. pp. 415. Price, \$5.

A wonderful history of wonderful races. We shall notice at length soon.

IN PRESS.

OLDPORT DAYS. By Colonel Higginson. Boston: James R. Osgood & Co. This is a forthcoming publication which will undoubtedly create a sensation.

OBITUARY.—Rev. John Todd, D. D., one of the best known clergymen in Massachusetts, died at Pittsfield on Sunday, the 24th inst. Dr. Todd was the author of the "Student's Manual," and numerous books for the young, and thirty years ago published a book most attractive to hunters and anglers, entitled "Long Lake," the same being reminiscences of life in the Adirondacks. He was a most ardent sportsman and an enthusiastic admirer of Nature, and a gentleman upon whom FOREST AND STREAM had reckoned for occasional contributions; for the Doctor took a warm interest in our enterprise, and volunteered to aid it by personal service. But death has cut short his career, while yet he had scarcely filled out the allotted measure of four score years and ten, (he was seventy-three,) and the world loses one of its most useful and brilliant ornaments.

We are in receipt of the second number of the *Christian Age*, of which Rev. C. F. Deems is editor. It is an excellent monthly journal, sober in tone, earnest in character, and what is better, full of the kindest charity. The make up of the paper is unexceptionable.

—Thomas Dick is the proprietor, and Henry Winnett the manager of the Royal Niagara Hotel at Niagara, Ontario. But isn't it rather against a house to have it kept by "Tom, Dick, and Harry?"

Mrs. Sarah Johnson, a white woman who was bitten by a rabid cat a year ago at Little Rock, Arkansas, died there last week from unmistakable hydrophobia.

—The Grand National Regatta will take place on Saratoga Lake on the 11th and 12th of September. The committee on requirements define an amateur oarsman to be a person who has never rowed in an open regatta, and who has not rowed for money, or been willing to row for money, since May 1, 1872, and who has not been engaged to train any person or crew in rowing or athletics for any compensation whatever. The Committee also say that no person who gains or has gained a livelihood by a continued use of boats will be permitted to row in the regatta.

The Capitoline Grounds in Brooklyn, it is now said have been selected for the ascension of the great "Graphic balloon," and the 7th September designated as the latest day for it to start on its voyage, though the Professor hopes to get off by the 1st. When inflated, the balloon will stand as high in the air as the tower of the East River Bridge now does.

—Within five miles of the town of Victoria (Vancouver's Island) black tailed deer can be shot at almost any time.

Forest and Stream.

OPINIONS OF THE PRESS.

The first number is a model of typographical neatness, and its contents are sufficiently varied and interesting to secure for the paper a cordial reception from that class of the public to whose taste it caters.—[New York Times.]

It is a handsome sheet of sixteen large pages, and is filled with a variety of very interesting reading.—[New York Sun.]

There is need for a new advocate to make the American people more in love with outdoor life, and FOREST AND STREAM promises to do the work admirably. The various departments are edited with knowledge and skill.—[New York Journal of Commerce.]

The publication of a new sporting journal, FOREST AND STREAM, is another evidence of the increasing love of our people for the sports of the field and athletic exercise. There is every evidence that good fortune awaits the new-comer. That this should be so is a source of congratulation.—[New York Express.]

The first number promises well, and its prepossessing appearance is no slight confirmation of its claim to a high and manly tone in its conduct.—[Home Journal.]

It is tastefully arranged and handsomely printed, and seems to be well adapted to persons of cultivated tastes.—[New York Tribune.]

Mr. Hallock is an enthusiastic sportsman, a good writer, and competent to make a "sporting paper" fit for household reading.—[New York Commercial Advertiser.]

We commend with special earnestness the claims of FOREST AND STREAM to favorable attention.—[The South.]

We may safely predict its success.—[New Orleans Home Journal.]

It is neat as to typography and varied and interesting as to contents.—[Hartford Times.]

The matter of the sample number is both appropriate and interesting.—[Brooklyn (E.D.) Times.]

It is a necessary publication, and we welcome its birth with open arms. It occupies its own position, intruding upon no pre-occupied ground, but it is an elevated position. To sportsmen of the gun and fishing-rod it will be invaluable.—[Brooklyn Review.]

Got up in a handsome manner, both as to presswork and arrangement of contents.—[Philadelphia Ledger.]

It is decidedly the most *recherche* thing of the kind ever issued in this country, and so far as we know is the peer of anything similar in England. All its departments show a practical and intellectual filling up which challenges general favor.—[Germantown Telegraph.]

Judging by the number before us we can unhesitatingly recommend the FOREST AND STREAM to all who take an interest in out-door recreation and physical culture. It will no doubt merit the patronage of our sporting gentlemen.—[Every Evening, (Wilmington, Delaware).]

The terms are very reasonable for such a large and necessarily expensive paper. We commend it to our sportsmen friends most heartily. We like the ring of its editorials, evidently written by the true lover of nature in its multiplied and beautiful forms.—[Niagara Falls Gazette.]

There is a standard of excellence and usefulness not yet attained by any sporting paper in the country, and FOREST AND STREAM will find its success at the top of the ladder.—[New York Graphic.]

It covers ground not occupied by any other journal.—[Waterloo (New York) Observer.]

WHAT THE PEOPLE SAY.

I hope you will meet with entire success in your project. My days of active life in the field and forest have gone by, but I recall my experience with pleasure, and I feel that I owe my health in a good degree to early habits of free exercise in the open air in forests and along our streams.—[Horatio Seymour.]

There is a demand for just such a paper as this. It will give me very great pleasure, indeed, to do all I can to help your journal.—[Professor S. F. Baird, Smithsonian Institute.]

I have no doubt that FOREST AND STREAM will have a large circulation. Consider me a subscriber.—[George A. Boardman, Naturalist.]

Such a journal, conducted upon the principles and with the spirit which you announce, will certainly find warm support.—[Rev. J. Clement French.]

I have no doubt you will make it a marked success.—[Hon. J. D. Catton.]

I wish you the best sort of success in your effort to make a journal of out-door sports such as a gentleman can read and write in.—[Charles D. Warner.]

I doubt not it will be a great success. It is wanted, and must be called for.—[Major John H. King, U.S.A.]

I have long wished just such a journal to receive into my family, that my boys may learn from a better teacher than myself the best way in which to follow the sports that in years past have given me so much pleasure.—[Henry W. Abbott, Boston.]

Under your management it ought to be a success.—[W. H. Venning, Inspector Marine and Fisheries, Canada.]

You shall have all the aid and comfort I can give you in your enterprise.—[Com. L. A. Beardslee, Washington Navy Yard.]

I must congratulate you on the very attractive appearance of your paper. Keep it up to the standard you have marked out for it, and it will become an assured success.—[Rev. Charles F. Deems.]

Nothing but the exigencies of my roving life have prevented me from starting, or trying to start, just such a journal as yours. You shall have my hearty co-operation.—[Professor Elliott Cones, Smithsonian Institute.]

Your paper is just what we have long wanted, and will take well in the Southern States.—[Dr. R. P. Myers, Savannah, Ga.]

The editorial matter, the contributions, and the make-up and general appearance of the paper are just such as Fishrod and Nimrod admire.—[Genio C. Scott.]

TONNAGE ON YACHTS.—In the case of a foreign-built sailing vessel which entered a United States port from Canada, without the papers of, and without claiming to be, a yacht, the Secretary of the Treasury has approved the action of the Collector of Customs in compelling her to take out clearance papers, and exacting tonnage tax on departure. If the vessel had arrived with the proper documents of a yacht, showing her to belong to a regularly authorized yacht club, she would not have been liable to the payment of tonnage tax, nor to be required to enter or clear, provided like privileges are extended to similar yachts of the United States. If, however, the vessel was a yacht, not belonging to an organized yacht club, though not subject to tonnage tax, she would be required to make entry and clearance.—*Washington telegram to Boston Post.*

Children begin now to save your pennies, that when the long evenings come you can buy "Avilude, or Game of Birds." If your storekeeper has not got it, send seventy-five cents to West & Lee, Worcester, Mass., and it will be sent by mail, post paid.

"Avilude is a superior game."—*Worcester Palladium.*

WATERS' PATENT

—IMPROVED—

Paper Boats

FOR

**RACING, EXERCISE, PLEASURE,
SHOOTING OR TRAVELING.**

The inventors having during the past six months given their entire attention to their manufacture, will with this season, introduce our IMPROVED PAPER BOAT, in the construction of which great improvements have been made, overcoming all objectionable features which have been developed during the past six years. We refer with pleasure to the record of the past.

Our boats have been wintered and summered in both hot and cold climates, rowed in both fresh and salt water, yet after five, and in a few cases six seasons of steady use, these boats can be shown as serviceable to-day as when first finished. They were awarded the FIRST MEDAL AND DIPLOMA OF THE AMERICAN INSTITUTE, at its Fair held in New York in October, 1869, and for racing and training they are preferred to those of wood by numerous boat clubs and numbers of the best oarsmen throughout the United States, having since their introduction been rowed by the winners of THREE HUNDRED AND TWENTY NINE MATCHED RACES.

Publications.**THE TWO SUCCESSFUL BOOKS OF
THE SEASON.****I.****Hallock's Fishing Tourist,**

The Fishing Tourist, Angler's Guide and Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association."
ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who write a book mainly for the reason that they have something to write about—have something to tell the public which the public desires to know. The shortest routes to pleasure are laid down, and correct information is given as to the best means of conveyance, the expense of the trip, the secrets of the commissariat, etc. The author has avoided the use of technical terms, and thus made his volume all the more acceptable.—*Turf, Field and Farm.*

II.**Prime's I Go A Fishing,**

I Go A Fishing, by W. C. PRIME, author of "Boat Life in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vigorous descriptions of scenery and character, is distinguished by a refined wit, a droll humor, a strong love of the beauties of nature, and an enthusiastic devotion to the piscatorial sport. This book will please all who admire heartiness of style and exuberance of animal spirits in their authors. There are some interesting and well-told stories scattered through the volume, which exhibits on almost every page the handiwork of a man of graceful culture and wide reading.—*Boston Daily Globe.*

Published by Harper & Bros., N. Y.

HARPER & BROTHERS, will send either of the above works by mail, postage prepaid, to any part of United States, on receipt of price.

FOREST AND STREAM,

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Co.,
103 FULTON STREET, NEW YORK.

Terms, Five Dollars A Year, Strictly in Advance. A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which, if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft, either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home," and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even *clanor* for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with a single exception, have been identified with leading journals for years.

Mr. SIMEON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

For the Forest and Stream.
EARLY DAYS.

TO childish years we love once more to turn
Ere life's young light—to its full dawning grew
To taste the spring that bubbles from youth's urn,
As fresh, as sparkling as the early dew;
We love the purity and grace of youth,
Its merry laugh from careless heart that flows;
The open brow, all innocence and truth,
The healthy cheek, as ruddy as the rose,
That by the way-side hedges all untended grows.

Dear then the joy to wander far and near,
To play the truant, reckless of the rod,
To tease the kine, or goad the browsing steer,
Or chase the sheep, or sluggish colt unshod,
Scour the wide plain, or scale the steepy hill,
With rusty gun borne with no kind design,
Regardless whether flesh or fowl it kill;
Or thresh the brook with clumsy rod and line,
Its hook a crooked pin, attached to vulgar twine.

Lo! as we muse, full many a slumbering string
In memory's harp weird fancy stirs again;
Round childhood's rustic roof birds gaily sing,
And the slant sunbeam peeping thro' the pane,
Invites us forth to taste the morning air,
With perfumes laden from the dewy ground.
Pleas'd then we seem these well-known scenes to share
To hear once more the fields with voices sound,
As the old steeple wakes the region round.

We hear the mower's whistle in the vale,
The sheep-bell's tinkle and the low of herds,
The plow-boy's call, the thrasher's sounding flail,
The hum of insects and the songs of birds;
The locust's drone, the whip-poor-will's lament,
The swallows chirp and the humming of the bee,
The squirrels chatter in his leafy tent,
The house wife's wheel, the sounds of childhood's glee
On sunny hills at play, or by the favorite tree.

ISAAC McLELLAN.

ANTICOSTI.

THE JOURNAL OF A NAVAL OFFICER.

[Concluded from our Last Issue.]

Finding it hopeless to do anything in the fishing line, I put my rod up in disgust, and De Courcy and self concealing ourselves in the wood bordering on the river, awaited the incoming of the duck. It was nearly high tide, so we were not kept long in suspense. Presently the familiar whistling sound made by ducks as they "swinge" through the air, greets our ears, and the next minute three black duck (*anas obscura*) swooping over the tree tops light with heavy splash on the water, not fifteen yards from where we lie. They are swimming close together, and with my first barrel I succeed in knocking over two, while the third, rising to the report, falls to De Courcy's discharge. The ball is now fairly opened, and for the next hour we keep the firing up with no lack of spirit. Now a flight of widgeon, (*anas americana*) or teal, (*anas discors*) easily distinguishable by their smaller size, and the close compact body in which they fly, would sweep past our hiding place, and four barrels would thin their ranks; anon a flight of sheldrake (*mergus serrator*) circling high above the woods, would seem to seek the most inviting creek, or pool, and finally after much deliberation would make for our ambuscade; just as they are coming nicely within range De Courcy unintentionally exposes himself, and off they swerve, too late, however, to prevent our bagging three of their number. Hardly has the smoke from our guns cleared away when the loud "honk" of a wild goose is heard, and before I have time to load, six geese (*anser canadensis*) sailing in line abreast, settle with much fluttering and noisy cackling upon the creek. My friend hastily slips a couple of green cartridges into his breech-loader, but it is not a bit too soon, for already the keen ear of the geese have detected some suspicious sound, and they are meditating flight. De Courcy waits judiciously till they rise, and then as they stretch

their pinions, preparatory to taking wing, offering a lovely shot, he let them have the contents of both barrels, and drops one stone dead, while another staggers off badly wounded. By this time I am ready, and blaze away after the retreating birds, but partly owing to my being loaded with duck shot, and partly to my being a good deal flurried, I fail to touch a feather, and the geese are soon lost behind the wood. Towards dark the black duck come in by twos and threes, and we fire with varying success, now picking off a straggler as he spins up the river, now missing altogether, occasionally getting half a dozen shots in quick succession as a large flight soar in from the reefs, and breaking up into little groups settle, some far out in mid-stream, others in the reeds close by, and as the woods re-echo to our shots, the wild fowl rise in all directions, and while some wheel out to sea, others, apparently confused by the rapid reports, head straight for our place of concealment, and the sport grows "fast and furious." At length as it is getting dark, and we have already more birds than we well know what to do with, we "count out the bag," (which Gamache and Flanigan have collected by degrees, and as opportunity offered), and find it to consist of one goose, twelve black duck, nine teal, seven widgeon, and three sheldrake, a total of thirty-two head, which was not so bad, considering all things.

That evening we feasted sumptuously off goose, and a "tit-bit" of widgeon to wind up with, and lighting a roaring fire, for the nights were growing cold, and throwing up a few boards to windward, we smoked and talked till nearly midnight, and after a few hours sleep were astir at daybreak, when the wind and sea had both gone down. We re-embarked our traps, and shortly after five o'clock started for Jupiter river, which we reached about nine o'clock. For some miles to the westward of the river perpendicular cliffs from one hundred to one hundred and fifty feet in height, bound the coast, which for a distance of a mile either side is free from reefs, deep water being found close inshore. A well defined valley marks the course of the stream, low swampy land receding from the left bank to gently sloping hills, behind which an elevated ridge may be seen trending almost due east and west. Beyond this valley the coast again rises gradually, and sandy cliffs, varying in height from fifty to one hundred feet, extend to Southwest Point. The cliffs to the westward are composed of a greenish gray argillaceous limestone, which though rapidly becoming hardened on exposure to the air, may, when first cut, be easily carved into any shape or form with a knife. Trappers have occasionally made pipes from it, and as many portions of the strata have a close texture, and take a high polish, it has been suggested that lithographic stones might be obtained from some parts of the cliff. A fresh cut block has that peculiar unctuous feeling we find in the soap stone.

Jupiter, or Observation river, as it is laid down upon the chart, is the largest stream in the island, having six or seven feet in the entrance, and being navigable for canoes for upwards of nine miles. It has a course of some twenty miles from the eastward, and abounds in deep quick pools, in nearly all of which good trout fishing may be had. The first salmon hole is about five miles from the mouth, but there are two or three pools four miles further up the river which afford better sport. Camping at these upper pools in the month of the August, sportsman may enjoy both good fishing and shooting, for when he gets tired of the former, he can strike into the "barrens," which are close at hand, and where he will be tolerably certain of having a shot at deer. As many as fifty barrels of salmon have been taken in Jupiter river with a seine during the season, but latterly it has not been netted at all. Some idea of the trout fishing may be formed from the fact that two hundred is no unusual number for a single rod to kill in a day, and though the majority of these run between twelve ounces and one and one-half pounds, there is a fair sprinkling of still larger ones. Unfortunately we arrived at the river on the 31st of August, the last day of the fishing season, and as our leave was drawing to a close we thought it better to push on to Southwest Point at once, and

endeavor to secure a passage in one of the schooners we had reason to believe would be cruising over to Gaspé about this time. Accordingly after a bathe in the river, and breakfast I started with the Indians in the canoe, leaving De Courcy to follow with Gamache later on.

One would have supposed that in an out of the way Island like Anticosti the rivers would not have been closely watched, and that one might, if one felt so inclined, have fished on the "Sabbath," or infringed the limits of the "close" season with impunity. The following fact will prove the contrary: When about four miles from Jupiter river, we observed a large boat bearing out of the cove at Southwest Point, and at first thinking it some fisherman changing his ground in pursuit of cod, we took no notice of it. Presently, however, as the boat stood well out from the land the Indians "smelt a rat," and informed us that it was "de spectre!" "The spectre!" "of whom?" perchance of one of the unhappy habitants of Dead Man's Point, who growing tired of his narrow beat had sought a new and larger "base of operations." "De fish-in spectre," again repeated the Indian as the boat bore down upon us; and a faint dawning of his meaning flashed across me. It was the Inspector, or Overseer for the district, who, I afterwards found out, had from the lighthouse perceived a strange sail introducing Jupiter river this morning, and was now off to ascertain what our little game might be. He was a big burly Frenchman, a disagreeable humptious fellow, and as soon as I saw that he wanted to intercept the canoe, I could not resist the temptation to give some bother, so telling the Indians to paddle hard inshore, we watched what effect our conduct would have. Sure enough he altered his course, and stood after us, and as we swerved in and out, as if trying to dodge him he followed suit, and at last overhauled us. "D'ou venez-vous?" sang out the "spectre" in a tone of voice that showed he was not over pleased at the chase we had led him, and when after a little consultation, and much shaking of heads, I replied, "no understand," he fairly boiled over, and his deep "sacre" came rolling over the water. "Whose chaloupe at Jupiter?" "Shallop? oh, that's ours." "Hah! c'est bon; I thought as much; vat you doing there?" "Doing? nothing I assure you." "Pouf! Allez-vous en, I vill see for myself." "As you please my dear sir, but I'll swear they're not fishing." As I had intended, this last reply introducing the fishing question, had the desired effect of confirming his suspicions that "our ways were dark and our tricks were mean" at Jupiter, and disdaining further parley, and with an audible chuckle as he thought of the discomfiture that would soon follow, the "spectre" let his sail down, and we were soon far apart. He arrived at the river safely enough, but only to find Gamache on the point of starting, and as he was most unmercifully "quizzed" by the latter on having "caught a tarter," he speedily beat a retreat, and turned his boat's head for home. The wind fell light, and died away altogether towards evening, and the unhappy "spectre" did not fetch back till nearly midnight. Gamache's boat being smaller and pretty light, they were enabled to pull, but even then it was ten o'clock before they arrived at the lighthouse.

On my arrival at the Southwest Point I learnt that a schooner would most probably be crossing to Gaspé in two or three day's time, and that Captain Setter's schooner would be leaving in about a week with her last cargo of cod. The schooner it appeared had been chartered by a Frenchman, by name Geffrard, (of which more anon) who with a gang of men, all French Canadians from Quebec, had been employed during the summer working on the wreck of a large iron clipper ship, lost early in the spring, and now lying in some ten fathoms of water. It had not been a successful venture of Geffrard's; his first trip had paid fairly well, but this second one, what with gales of wind, which put a stop to all diving, and lazy workmen, he was returning considerably out of pocket, with but two iron yards and a chain cable.

During our two day's stay at Southwest Point, we were most hospitably entertained by Mr. Pope the keeper, wh

lives here, surrounded by an abundance of the "good things of this world," foremost among which stand a wife (whose kindness and attention to our "creature" comforts could not have been exceeded,) and some nine or ten "olive branches," of all ages and sizes, and whose fat ruddy cheeks bear ample witness to the healthy climate of their island home. Mr. Pope is a man beloved by the rough fishermen, amongst whom he lives, for his bravery and exertions in time of shipwreck have been often proved. During his sojourn on the island he has at great personal risk, succeeded in saving the lives of ten shipwrecked mariners, besides having been instrumental in rescuing many others from a watery grave. Of so modest and unpretending a character, however, is Mr. Pope, that his services have I believe only once met with an acknowledgment from the Board of Trade of the Dominion. Such gallant deeds, though they meet not always with the appreciation they deserve, should not be allowed to pass unnoticed, and I rejoice at the opportunity here afforded me of making so brilliant an example, and one well worthy of imitation, more generally known.

Southwest Point is formed by a projecting mound of limestone, with a small cove on the northern side, which almost constitutes it a peninsula, and the lighthouse which stands on the western extremity is built from a grayish white, coarse, granular limestone, quarried on the point. To the geologist, Southwest Point is full of interest, for the bed which forms the upper strata consists almost entirely of organic remains, and large numbers of encrinurites, chiefly in the form of crinoidal columns, and many fossil shells may be picked up throughout its entire length. Red hematite, a peroxyde of iron, lies scattered over the central bed in irregular sized nodules, some of which are nine or ten inches in circumference. The cove affords shelter from all but westerly winds to vessels of almost any draught, for so deep is the water that a line-of-battle ship might lie close under the bluff at the extremity of the point. There is no beach, the sea washing directly against the lower strata of the limestone, which in many places has been undermined into hollow caverns, and eroded into deep narrow fissures by the violent action of the waves. With a westerly wind, a heavy swell sets into the cove, and the water rushing into these so-called "canons," strikes with loud report, while the escaping air throws up high columns of spray. For some years past the Point has been visited during the summer months by a few families engaged in prosecuting the cod fishing off the reefs. At the time of our visit, there were some thirty fishermen, all of whom had been unusually successful, the cod having struck early and in large numbers. Fine halibut are taken, and were there only some means of sending them packed in ice to the Canadian or American market, this fishing would prove most remunerative. As matters stand, halibut being more troublesome to cure than cod and not so profitable, the fishermen infinitely prefer catching the latter, and consider it a piece of bad luck if they hook one of the former. Large shoals of herring are periodically taken with the net, and a tremendous haul had been made on the morning of our arrival. Unfortunately, however, as it was near the close of the season, there were no barrels to pack them in even if they had been cured, and so for the next day or two the surface of the cove and the limestone rocks around it were strewn with dead herring, thrown away, as there was no use for them.

The fishermen at Southwest Point are principally natives of Douglastown, (on the southwest shore of Gaspé Bay,) and whereas the summer residents of English Bay, natives of Perce, Paspébiac, and Pabou, were with few exceptions of French Canadian descent, those here were almost to a man of Irish origin. The descendants of the "United Irishmen," many of whom, after the troubles of '98, leaving their native country, settled along the shores of our North American colonies, the inhabitants of Douglastown still retain the Celtic features, unmistakable brogue, and patronimies of their forefathers, and so strongly are those characteristics marked that a stranger passing through parts of their little village might for the moment almost fancy himself in the "old country."

Peculiar to the island is a remarkably fine breed of dogs, apparently a cross between the "Labrador" and "Newfoundland." They are a large powerful looking dog, standing from twenty-five to thirty inches in height, rather long in the body, and with great breadth of chest. In color they are generally of a rusty black, sometimes marked with white, the hair straight and long, and showing but little tendency to curl. The lighthouse keepers and few residents of the island use them for lumber drawing and sleigh driving in the winter, and the fishermen at English Bay had several which they fed altogether on the offal and refuse of the cod. The finest specimen we saw was one belonging to Mr. Pope, which was about the handsomest dog I had ever seen. He did not stand more than twenty-six inches high, and was beautifully proportioned, with an enormous depth of chest, and a jet black curly coat of hair, so thick and deep as almost to resemble fleece. He was a young dog, only three years old, but his strength and powers of endurance were wonderful. In the winter he would alone draw a sleigh many miles a day, and would plunge in amidst the drifting floes of pack ice time after time to bring out wounded ducks that his master had shot. The latter told me that on one occasion when he had knocked over nine or ten birds of a large flight of eider duck, (very common on the island in winter time) his dog jumped in six successive times, on each occasion returning with a duck, which he laid on the shore; his legs and chest were cut from contact with the sharp ice, but such was the dog's

spirit that he would have dropped from cold and sheer exhaustion, had not his master held him back. Poor "Sailor!" he met with a cruel and untimely death. The evening before we left one of the fishermen had occasion to go into the woods to draw a bucket of water from the spring. On his road he met Sailor, and began teasing and tormenting him to such a degree that at length the poor beast turned and snapping at his tormentor bit him in the hand. Muldowney, for that was the man's name, on his return home told his brothers of what had happened, and they determined to have their revenge. About eight o'clock, as we sat round the kitchen fire in the basement of the tower, we heard the report of a gun, and the next minute one of Mr. Pope's assistants ran in, breathless and excited, and stammered out, "*Muldowney a tue le chien!*" If Pope had been told of the death of one of his children he could hardly have been more startled. He turned white as a sheet, and for a moment remained speechless, as if incredulous, then the blood rushing back to his cheeks and his temples as his anger rose, he made for the door, and had he once passed the threshold it would have fared ill with Muldowney. Luckily, however, on the first sound of the commotion, Mrs. Pope ran down from the upstairs room, and held her husband back, and as he became calmer, and he thought of the loss he had sustained, the tears started to his eyes, and had it not been for our presence I believe he would have cried like a child. If ever dog worked itself into human affections, Sailor most certainly had found his way into his master's, for the latter would sooner have lost his right arm than parted with the trusty companion of his long winter hunting days. Independently of this attachment, the death of Sailor was a serious pecuniary loss, for, as I stated above, he brought many a bird to the "larder," and the eider duck alone were a source of profit on account of their down. The year before a gentleman shooting and fishing in the island, and who spent a few days with Mr. Pope, offered him £30 for the dog, and if Captain H. happen to read this he will, I am sure, hear with regret of the death of such a noble animal.

And now as the eve of our departure arrived, it was not without a feeling of regret that we prepared to say "good bye" to the island. We had shot and fished along some seventy miles of the southern shore, but had time permitted there was still a wide field for the sportsman. Salt Lake Bay, eleven miles southeast of Southwest Point, was worthy of a visit, if only on account of its natural salt pans; but besides its interest from a geological point of view, it possesses another attraction, for it is one of the best bear grounds in the island, three bears having been seen there the week before our arrival at the lighthouse. The salt pans which, in the form of inland lagoons and ponds, skirt the coast for a distance of four or five miles, were once largely resorted to by wildfowl of every species, but latterly, since the establishment of a small fishing station, they have been nearly deserted.

A few miles in rear of the coast, a vast peat bog, averaging two miles in width, and from three to ten feet deep, reaches from Salt Lake Bay to Heath Point, seventy miles distant. This enormous bog is not more than twenty feet above the level of the sea, towards which it has a slight inclination, so that if channels were cut, it might be easily drained and worked. Other bogs of less extent occur throughout the island, and no doubt some future day, when the lumber and coal fields of North America become exhausted to such a degree as to seriously affect the price of these articles, (as we have seen recently in England,) the great deposits of Anticosti will be of large value. We would fain have taken a glimpse at Fox Bay, with its tragic tale of shipwreck and suffering, and seen some of those magnificent limestone cliffs which line the northern coast, and rising sheer from the sea often attain a height of four hundred feet, while occasionally they assume titanic proportions, towering upward in one huge wall of dazzling whiteness nearly six hundred feet. Of rivers, too, there were many to be explored, the principal being Pavilion river, thirty-six miles southeast of Southwest Point, Shallop creek, (where good wild fowl shooting may be had,) twelve miles east of Pavilion river; Dauphin river, a few miles to the eastward of South Point, and Salmon river, on the north shore, distant about fifty miles from the lighthouse on Heath Point. All these streams abound in trout, and yield fair returns of salmon to the net fisherman, in 1869 twenty-one barrels of the latter fish having been taken at Salmon river; twelve at Shallop creek; nine at Dauphin river, and two at Pavilion river. A visit to these places we had, however, to forego, but I look forward at no distant date to again finding myself on the island. There is a delicious absence of all restraint, an utter disregard for the morrow, and a wonderful sense of freedom about such a life, which cannot be realized except by actual experience, and it is little wonder that they who have once tasted of this wild roving existence should leave it with regret.

During our stay, with the exception of a few wet nights, we had been favored with lovely weather, and though we had not met with any brilliant sport, (not from there being any lack of it, but chiefly from hurried movements, and it being too late for fishing,) we had nevertheless spent a most enjoyable fortnight. Strange to say our advent had been ushered in by a fog and wind, our sojourn was marked by a Boreal interregnum of calm and serene weather, and now as the evening approached on which the schooner was to leave, the mist coming up from seaward, the thick, drizzling rain, and the rising wind, showed that we were not to quit the island without a final proof of the fury of the elements.

We were nearly half an hour pulling off to the schooner,

which was standing off and on three quarters of a mile from the shore, her captain, a young Frenchman, having vowed that he would never cast anchor inside the cove. It appeared that his vessel had been lying all summer about half a mile from the Point, much to the inconvenience of Geffard, who found it no easy task to tow any portions of wreck he recovered such a distance. The weather had been unusually calm, and at last Geffard persuaded the skipper of the schooner to anchor in the cove, assuring him that there was no cause for alarm. That very night, as ill luck would have it, it came on to blow from the westward, the worst possible quarter, the Frenchman's anchor dragged, and he was within an ace of losing his vessel on the rocks. He escaped by a hair's breadth, but on the principle of "once bit, twice shy," he determined not to be caught again, and from that day till he left the island for good, rather more than a fortnight, he remained, like the "Flying Dutchman," cruising off the Southwest Point, never once dropping anchor, standing in periodically to within a mile to allow Geffard to put any spars he might have saved from the wreck on board, when he would be off again to sea. The schooner was "hove to" to allow us to come alongside, and as we hoisted the boats inboard and "let draw," the Frenchman shook his fist threateningly at the receding shores of the island, and as he snapped his fingers, gave utterance to his feelings in pithy and forcible language: "*Sacré, you Anticosti, I nevere see you no more.*" The mist settled down thick and fast upon the land, and the lighthouse was soon lost to view, the rain came down in torrents, and the wind moaned through the rigging with a mournful sound which always seems to be the precursor of a storm. It certainly was as gloomy looking a night as one could well imagine, and on board the schooner matters were, if possible, still less cheering. The forehold was occupied by some fifteen of Geffard's men, while the caboose was filled by that worthy himself and the crew, four in number, all of whom were either smoking or spitting tobacco juice over the deck. The hatch cover had been hauled over to exclude the rain, leaving only a narrow opening leading down to the caboose. From this ascended a smell of cod oil, tobacco, and filth in general, that was simply overpowering, and for a long time we preferred remaining on deck and getting soaked to facing the loathsome den, and when driven down at last by the seas that broke over the vessel, we ventured below, it was only to return in a few minutes to make a rush to leeward for a purpose I need hardly describe. About 10 o'clock the storm burst upon us in all its fury—

—"*Ponto nox incubat atra,
Intonere poli, et crebris micat ignibus æther.*"

It was a pitch dark night, lit only by the lurid flashes of the forked lightning, which seemed at times to strike the waves and run along their tips in streams of liquid fire; peal after peal of thunder followed in rapid succession, culminating in one grand clap which seemed to have exhausted all the batteries of heaven. For a few minutes there was a lull, and then with redoubled fury the elemental war commenced afresh. The schooner peeled over to the surging wind, and as the seas struck her on the quarter, she shook from stem to stern, while the water pouring over her bulwarks swept her decks fore and aft. High above the din of the storm, the thunder clap and the roaring of the wind, were heard the confused orders, frantic shrieks, and deep "sacrés" of the French seamen, as they tried to shorten sail, while the occupants of the hold, more affrighted than the rest, and thinking their last hour had come, appeared on deck, where, holding on like grim death to shrouds, belaying pins, or whatever else they could clutch, they uttered "Ave Marias," and made rash vows which I fear were never fulfilled. Sleep for a long time was out of the question, and when about midnight the storm showed signs of abating, and we thought of turning in, it was a long time before we could make out how on earth we were to get into the bunks. Hitherto I had always found it a simple matter enough to get into, and a very simple one to get out of a bunk, as I once found to my cost in H. M. S. —, when I was shot out of my berth and landed in a most indiscriminate mass, bed-clothes and all, on the wardroom deck, a most undignified proceeding on my part, I'll admit, in consequence of which I went about with a broken head for a week afterwards. *Mais recenons à nos moutons.* The bunks in this particular schooner must have been designed by an undertaker, for I can only compare them to coffins, with a square hole in the centre of one side. Through this hole, first inserting the head, and having wriggled that member of the body into the upper extremity of the coffin, you were then supposed to draw the legs and deposit them somewhere at the other end. They had one advantage certainly over an ordinary bunk; when once fairly inside, "blow high, blow low," it required no effort on the part of the occupant to remain there, and on this consideration I would recommend their adoption on board passenger steamers generally—no, stay; on second thought I don't; possibly one day I may have to travel in one, and Heaven forefend that I should again pass through similar contortions to those I underwent on the night of which I write. For a long time I sat blinking and gazing wistfully at the bunk, anxious to get some rest, and yet not half liking the only means by which I was to obtain it. Probably I would have sat there till morning, had not an old white-headed Frenchman, the mate, I believe, come to the rescue. After attempting by gesticulation, and a jargon to me wholly unintelligible, (the fellow spoke bad *patois French*, at least that was the only way I could account for it,) to explain the easiest method of getting into the bunk, and finding that mode of explanation a total failure, the old gentleman next proceeded to give a series of practical illustrations or "dissolv

ing views," wriggling himself in and out of the bunk like a young eel. When he had repeated this manœuvre several times in the most grave and solemn manner, I felt bound to follow his example; so the next time the mate bobbed out I resolved to bob in. Legs, body, head, all followed in panoramic order, and making a dive I shot my head through the aperture. Unfortunately, at that moment the schooner gave a heavy lurch, and my cranium and the vessel's side came in rather rough contact, and with the succeeding lurch I was shot out into the old Frenchman's arms. "Bravo, bravo, essayez encore une fois, Monsieur!" and patting me approvingly on the back, the mate incited me to fresh "deeds of daring." By dint of much patience, several trials, and a few hard knocks, I at length succeeded in stowing myself away, and though the atmosphere of my "charnel house" was purgatorial, a thick cloud of tobacco smoke, delicately perfumed with cod oil, filling the bunk, I thought it wiser to remain where I was, and spite of all these *disagreements*, soon dropped off to sleep. When morning dawned, we found the gale had driven us far out of our course, and as the schooner was somewhere off West Bay, we had to beat up for Gaspé Bay. At 2 o'clock we were close to the southwest shore, at the entrance, and as the wind was falling light, and it was a long beat up the bay, we lowered the canoe, and paddling some way down the coast, landed above Douglstown, whence we walked into Gaspé village. It was past 3 o'clock when we started, and the distance was sixteen miles, but we were in good training, and reached the Gulf House before 7 o'clock, where we found welcome faces and kind friends eagerly awaiting our arrival.

Lieut. W. HUTCHINSON POE, R. M. L. I.
[The End.]

A MESS OF STRIPED BASS.

EDITOR FOREST AND STREAM:

One morning I jumped from my bed just as the sun was lifting his head above the Eastern horizon, and having hastily swallowed my breakfast, jumped on a horse car and arrived at the foot of Court street, in good time. The "Marie" was quickly lowered into her native element, and placing my traps aboard, I started for Oyster Island, where I had caught a fine lot a few days before. But on getting out into the North River the wind left me, and I drifted down to Robin's Reef, thinking to sail up on the flood. I hailed the old light-keeper, and he consoled me by saying that there were no fish; that even they were affected by the hard times and would not bite, no, not they! they knew too much now-a-days, "and then he wanted the loan of two or three fishing crabs, which he promised to return "the very next time I came that way."

"Well," I soliloquized, "I suppose I must wait," and as it was our dinner-time, (10 o'clock), I let go killock that I could just rig out my rods, (I always fish with two), and throw my lines over "for the fun of the thing." I did so. And now for dinner. I had just reached out for my cold-cut, something, by the way, so often obtained when least desired, when whang, bang, went my short rod against my leg. "Good gracious, I exclaimed," what's up now? a confounded dog-fish, I suppose, and I reached out for my "sticker" to punch him with. But my rod and line soon told me a different story by the sharp and quick dashes that they made from one side of the boat to the other; and then fifty yards of line ran out like a flash. I seized the rod and the sport began; and, after an exciting pull, he rolled over alongside, and displayed the proportions of a fine bass. But he was hooked only by the tender and fragile part of the mouth, and on the least strain I would be sure to lose him. It was a nervous minute, I assure you. It is wonderful how electricity or something else does run up your line, and down your rod, and all through your arms and legs at such a moment. He made another run, but I hauled him gently and safely, and soon had him again alongside. In placing my landing net under him he gave one more "flirt" for freedom, and broke the hook from his mouth, but, luckily, fell into my net, and in another minute I had him in the boat; he was a noble fish. The excitement of catching this fellow caused me to forget, for the moment, that I had another rod and line out; and when I did look for my float, I perceived another fish had hold of the hook, and had run off two hundred feet of line. So to work I went, with a will, to fetch him in, but before I could do so my short rod was again hard at work bumping against my legs like mad. And so they kept it up until I had my car alongside full of fish, and nearly all my boat, too. Now and then a common tern would skim over me, stop an instant, look at me with his black lustrous eyes, and dart away again seeming to think, "nicking the fins, aint he?" Well, kind reader, I kept nicking them until nature tired, and then I left off, and fixed up my fixings, for they were really out of gear. My old rod was all sorts of shapes, and my reels so wet and full of crab and scales that they jammed. At 5 o'clock P. M., I had strength enough left to set my fore sail, and let the little "Marie" go. She seemed to know that I was in a hurry and fairly skipped over the waves. I will not tell you of my success that day in numbers, but I will say that on reaching the landing the news spread around quickly enough, and several families had a good supper on bass and weak fish that evening.

Now gentle reader, did you ever have some bright and beautiful day fastened on your heart string's memory? If so, perhaps it was when you were a youth and killed your first bird on the wing; perhaps it was your first string of "Sunnies;" or perhaps it was the first time that you saw Julia's big blue eye looking fully at you, and made you feel "just so," and you went home and tried to sleep but could

not, but for all that you were "kind of happy" and never forgot that "peculiar" day. So was this day with me; one of the glorious clouds of memory fringed with gold. I think of it over and over again and it always makes me happy. I can call back the most minute acts of the fish, how I just saved one big fellow, and how another made me think I had a "rouser," but it was only a one pounder hooked on the outside of his gills; how I sailed home as the sun was throwing his slanting rays over the place "out of the Union," and beginning to grow dim and foggy, I thought all the world was happy because I was. It was a joy of the heart that only a fisherman can experience, for he feels at peace with all the world after "nicking the fins."

SQUETEAGUE.

THE MIRAMICHI FOR SALMON.

NEW HAVEN, Conn., September 6, 1873.

EDITOR OF FOREST AND STREAM:

Some weeks ago I promised you notes of my trip to the salmon country.

Friday, July 11, at eight A. M., I took a steamer of the International Steamship Company's line, Commercial Wharf, Boston, for St. John, New Brunswick. We reached Portland, Me., at half-past four P. M., leaving again at six, stopping at Eastport at ten the next morning, having time to run about the quaint little town for an hour. Bidding good-by here to a couple of friends bound for the Schoodic lakes, we resumed our trip, reaching St. John at four P. M. The run from Boston was thoroughly enjoyable. We had an excellent boat, well manned and managed, officers efficient, without brusqueness or airiness, courteously attentive and obliging to all; a bright sky, smooth sea, fresh breeze, and much of the way, after leaving Eastport, near views of this rugged Eastern coast, bold and picturesque, a constant source of interest and beauty.

The tourist may pleasantly spend a day or two in St. John, a city set upon hills of rock, having an aspect quaint, foreign, old; in interesting contrast with the prevailing newness apparent in the cities of "the States."

Tuesday, the 15th, we took steamer up the St. John for Fredericton, a noble river, its scenery constantly reminding one of the Hudson, though its bordering reliefs are less bold and rugged. The greater part of the distance, a broad interval, sometimes several miles in width, lies between the river and the high-land border. This vast interval is annually fertilized by spring freshets, and yields many tons of the best hay for the mere labor of cutting it. The sail through this wide, green meadow land, embellished by scattered elms and occasional clusters of other trees, was one of unceasing pleasure.

We found a fine hotel at Fredericton, the Barker House, which receives its guests with a cordial welcome, and supplies every comfort.

Early Wednesday morning we took stage for Boiestown, forty miles away, on the southwest branch of the Miramichi River. For many miles our route was through the beautiful Valley of the Nashwauk, which, to see and traverse, is of itself well worth a considerable journey.

Near Boiestown we had our first view of the famous Miramichi. Salmon (if we may accept local assertions, as I do not), do not take the fly below Wilson's, about five miles up the stream. We went on therefore, at once, by private conveyance, to the place of this genial and hearty gentleman. We found him the proprietor of more than 500 acres, much of it under excellent tillage, and surrounded by every appearance of thrift and comfort. For several weeks his house was a real home to us, abounding in comfort and good cheer for body and spirit. His house is delightfully located upon a high terrace, bordering a broad interval, and commanding an extensive river view. About an eighth of a mile from the house and opposite, across the green meadow, is a very fine salmon "pool," never failing, during the proper season, to yield to the fly good returns daily of the gamesome grilse, if not of salmon.

In regard to salmon fishing in this river, I propose not to withhold the truth, as I think it well for all concerned that it should be known. If there were no other reason, I would not have brother sportsmen misled or disappointed, who, another season, as I was this, may be seeking an attractive summer resort. Understand me. I have *not* been disappointed. I came without expectations. I had never seen a live salmon. I have been more than satisfied. The genuine sport I have had with grilse has far surpassed all I have ever had, or seen, or heard of, with trout. But I have only taken a single "salmon." It is but fair to say I have spent but a very few days upon the upper portion of the river, which is the best. I have heard, however, of much dissatisfaction from those who have thoroughly tried it. Gentlemen have come from a distance, and have left disappointed, because of the "poor salmon fishing." The disappointment is the keener because it is universally felt to be so entirely unnecessary. The trouble is in a radically and strangely defective supervision of the river. Of course, the relentless, exterminating slaughter of fish in these waters can be stopped, as it has been elsewhere. It ought to be stopped. The run of large fish this year has been abundant, but a regular system of destructive poaching, with only the most feeble attempts at prevention, has thinned them out terribly. Laws sufficiently stringent have been passed, and wardens appointed to see that they are obeyed, but it is affirmed by honest men on the river that, except in one or two rare instances, no warden has been known voluntarily to perform the first official act, except to draw his pay. The culpable neglect of these wardens is known to their official superiors, and apparently tolerated. This

is the honest and simple explanation of the fact that, in the upper and fly-fishing half of the river, the sportsman finds only a straggling and occasional salmon. The lower half is, at every good place, crossed by nets, set in the most open defiance of law. Moreover, every night, through the whole length of the river, torches are seen at all the good pools, where the brutal spear of the professional poacher picks out the few fish that may have run the gauntlet of the nets below. Is it any wonder that so few salmon respond to the fly of the sportsman? To me it seems strange there are any. Strangers visiting here will continue to be disappointed, until there is a severe reform, either in the system or the method of supervision. Gentlemen of intelligence and business efficiency are deeply interested in the thorough protection of the stream. By them it is hoped, and expected that the needful measures will be adopted at the next winter's session of the Legislature. In that event the immediate result will be to admit an abundance of salmon to the whole length of the river.

Among your readers may be some who need to calculate expenses. A few details for such:

An "excursior" ticket by steamer from Boston to St. John, costs \$9 in currency; state-room, \$2; four meals, \$3 50. The leading hotel at St. John is the Victoria; \$3 a day, gold. Others, thoroughly good, are the Waverly, the Royal, Barnes', &c., at \$2 a day. Fare to Fredericton by rail or water, \$2; to Boiestown, by stage, \$2 50; to Wilson's, \$1 50. (By addressing William Wilson, Boiestown, N. B., he will meet gentlemen upon arrival at Fredericton, and bring them through to the fishing-ground with expedition and comfort). Guides' charges are \$1 50 a day and found; also, a charge is made of \$2 for each rod, for each day in camp. Dingey Scribner, of St. John, furnishes the best of fishing tackle, at reasonable rates. A salmon rod costs \$16; a reel, \$8; line, \$8; gaff, \$2 50; flies, \$2 50 a dozen. Time from Boston to Fredericton, by rail, about twenty hours. Fare and incidentals about the same as by steam with state-room and meals.

At William Wilson's gentlemen or ladies, or both, may rely upon finding every essential comfort, with a constant spirit of good cheer that makes daily life there a pleasure. Board, \$4 a week.

Reliable fishing appears to be practically over about the first of August. The best is for about a month, commencing June 20, and the first half of that month is much better than the last.

I cannot close these rough notes without expressing the real pleasure with which I remember so many gentlemen who have placed me under grateful obligations, by substantial and kindly attentions. Mr. C. Robertson, of St. John, one of the principal lessees of the river, received me in the most cordial manner, as I am sure he would do every true sportsman. But for his unexpected kindness and proffer of special facilities, the plan of my summer campaign would have been entirely different. Any one proposing to visit the Miramichi will find it of material advantage to address him.

I must also mention our most estimable and efficient U. S. Consul at Fredericton, S. Baker, Esq., whose attentions are as cordial as they are considerate and serviceable. It would be difficult to express my sense of his kindness and courtesy. I am sure that any "American" visitor at Fredericton will find it a pleasure to make his acquaintance. From his establishment may be had complete supplies for camp life, of the best quality.

T. W. T. C.

DANBURYANA.

—An old, prosaic proprietor of a Danbury dirt cart, was once the most romantic of men. When he was married he built a little cottage on a rock close to the river's edge, and one night during a storm, a schooner was driven against the bank, and the bowsprit pierced his house, threw him and his wife out of bed, broke one of her legs, and nearly dismembered him. Then he moved to an interior city, and rented the fourth floor of a brick building on a back street.

—The shooting about Danbury is excellent now. You are foolish if you don't take a day from the cares of business, borrow a hammer, and enjoy the sport.

—A Danbury boy wants to know if it is right for his folks to pay five hundred dollars for a piano for his sister, and make him pick berries for circus money.

—The wife of a carpenter loses more time in trying to make a door shut than any other woman.

LACUSTRINE DWELLINGS IN GERMANY.—The remains of ancient habitations raised on poles are of rare occurrence in Germany, and hence the discovery last year of the debris of such structures in the bed of the River Elster, near Leipsic, awakened a lively interest. The discovery was made by Herr Jentzsch, of the Geological Institute of Austria. The order of the visible strata at this point is as follows:—At the base is found a layer of sandstone; on this a lacustrine clay. Both of these belong to the upper portions of the quaternary rock. In the clay are two beds containing the remains of plants, and among these are found leaves of the willow and oak, fruit of the Acer, and sundry other vegetable fragments. Above these occurs a layer of roots some inches in depth, which shows that the surface of the soil remained at this level for a considerable period. The uppermost layer, two to three metres thick, was produced by an inundation. The piles discovered by Jentzsch in the bed of the Elster are set in the clay and covered over with this silt. They are arranged in circles, with their lower ends pointed, and their upper extremities connected by horizontal ties of oak. Among the animal remains found here are the lower jaw of an ox, with its teeth; stags' heads, the long bones of some mammal yet undetermined, and shells of the unio and anodon. No traces of human remains have been found, though fragments of pottery and charcoal are met with; also two stone hatchets.

THE OLD CANOE.

WHERE the rocks are gray and the shore is steep,
And the rugged pine, in its lonely pride,
Leans gloomily over the murky tide;
Where the reeds and rushes are long and rank,
And the weeds grow thick on the winding bank;
Where the shadow is heavy the whole day through,
There lies at its mooring the old canoe.

The useless paddles are idly dropped,
Like a sea-bird's wings that the storm has lopped,
And crossed on the railing, one o'er one,
Like the folded hands when the work is done:
While busily back and forth between
The spider watches his silver screen,
And the solemn owl, with his dull "too-hoo,"
Settles down on the side of the old canoe.

The stern half sunk in the slimy wave,
Rots slowly away in its living grave
And the green mass creeps o'er its dull decay;
Hiding its mouldering dust away.
Like the hand that plants o'er the tomb a flower,
Or the ivy that mantles the falling tower;
While many a blossom of loveliest hue
Springs up o'er the stern of the old canoe.

The currentless waters are dead and still—
But the light winds play with the boat at will,
And lazily in and out again
It floats the length of the rusty chain,
Like the weary march of the hands of time,
That meet and part at the noontide chime,
And the shore is kissed at each turning anew,
By the dripping bow of the old canoe.

Oh, many a time, with a careless hand,
I have pushed it away from the pebbly strand,
And paddled it down where the stream runs quick,
Where the whirls are wild and the eddies are thick.
And laughed as I leaned o'er the rocking side,
And looked below in the broken tide,
To see that the faces and boats were two,
That were mirrored back from the old canoe.

But now, as I lean o'er the crumbling side,
And look below in the sluggish tide,
The face that I see there is graver grown,
And the laugh that I hear has a sober tone,
And the hands that lent to the light skiff wings,
Have grown familiar with sterner things,
But I love to think of the hours that sped
As I rocked where the whirls their white spray shed,
Ere the blossom waned, or the green grass grew
O'er the mouldering stern of the old canoe.

PLOVER SHOOTING IN VIRGINIA.

NORTHAMPTON, VA., September 5, 1873.

EDITOR FOREST AND STREAM:—

NOTWITHSTANDING the numerous assurances I had received that it was useless for me to expect to get plover, I determined, before leaving for New York, to try a morning's shooting in this locality, especially as I had an invitation from a Virginia friend, a thorough sportsman, who was well acquainted with all the localities most likely to be frequented by this rather shy bird.

I found my friend ready to receive me, with horse and buggy. He assured me of the excellence of his horse, not as to speed, but as to his stalking powers, as he informed me that he had shot behind him for the last thirteen years. Plover can generally be readily approached by the sportsman, when he is in a buggy. We drove not more than three-quarters of a mile from the house, and it was about half-past five o'clock in the morning, when my friend informed me that we were in what was, in former years, the best place for plover in Virginia. The sea was about half a mile distant, and a long, watery bog stretched just here, parallel with the beach. The soil was covered with the tough, wiry, salt grass, though here and there stood isolated clumps of trees, and an occasional thicket. The plover roosts somewhat more inland, and betakes himself at dawn to feed on the grubs and small slugs he may find in the marshes. My friend was rather fearful that the sport would be poor, and he informed me that every year the birds were getting scarcer. Ten years ago, he told me, that just where we were then, he had often killed thirty plover between sunrise and nine o'clock. We were driving towards a neighboring clump of trees, through rather soggy ground, when he sighted five plover flying at a distance beyond us, entirely out of gun shot. We remained quiet in the buggy, when my companion took a "call" from his pocket, made from the leg-bone of a curlew, and piped the shrill cry of the plover. As we were well covered by the trees, the birds answered the call instantly, and flew straight towards us, when, both of us firing at about twenty-five yards, we killed three fine birds. Old Bob—the horse—stood fire admirably, never budging. This early success somewhat inspirited my friend, and as the wind was blowing on shore, the best condition for plover shooting, we had hopes of making a good bag. We waited, however, at this same spot for fully two hours more, but could see no birds. Old Bob was urged on, and, as we went along, breakfast was in order, and I, for the first time, ate cold roasted coon, which is a morsel by no means to be despised, especially when a cool sea-breeze whets the appetite. Jogging leisurely along, we must have proceeded quite two miles, when before me, about 200 yards distance, I saw quite a flock of plover. They were scattered over an area of fully an acre, and, perhaps, numbered forty. We got out of the buggy—slipping out behind, and clucking to Bob, we followed in the wake of the wagon. When within fifty yards of the birds, a word from us brought Bob to a full stop, and crouching down on our hands and knees, we

slowly approached the plover, and when within thirty yards, we flushed them. They rose *en masse*, pretty close together, when my friend, with his Lancaster, and I with my Snyder-Allen, let them have the four barrels, and nine birds fell. We could do nothing more with the flock, as they flew off three-quarters of a mile, to a point where we could not drive. After collecting the birds, we made for a good-sized clump of woods, some mile and a half distant, when we came to a cross-road. Bob was tied up, and a feed left for him, while we walked through the woods, shooting an occasional rabbit. The sun being oppressively hot, we remained there through the heat of the day, looking up some fox traps, which the negroes had set. We found in the Newhouse-traps one very handsome dog fox and two cubs, which we despatched, setting the traps anew with some birds my friend had brought with him for that purpose. About five o'clock we retraced our steps, killing five more plover, all of them single birds. Total bag for the day, eighteen birds. Plover are by no means an easy bird to kill; they are very swift flyers, when on the wind, though their flight is limited as to distance. I should recommend No. 7 shot in all cases. If plover are hard to find, this does not arise from over-shooting. I must attribute their growing scarcity to the reasons stated by me in my last letter to you from Mockhorn (providing Jake reached Cherrystone with my last letter to you). I attributed, therein, the scarcity of plover to the constant destruction of their eggs in this part of Virginia.

Sincerely yours,

C. B.

ATTRACTIONS OF NATURAL SCIENCE.

MILLTOWN, MAINE, August 30, 1873.

EDITOR FOREST AND STREAM:—

I am more than pleased with the first numbers of the FOREST AND STREAM. Such a paper, I think, is very much needed to educate our people to out-door exercises and sports, and to the study of natural history in some of its branches. To the lovers of the beautiful—to one who delights in the gay, bright beings of nature, ornithology is one of the most attractive branches of natural science. How little most people know of the number and variety of birds that annually visit every part of our extended clime, or are even aware how many spend the summer in our immediate vicinity. We little think every time we walk in our grounds and gardens we are intruding upon rare and elegant visitors from Mexico, Central and South America, Florida, and islands of the sea; but such is the case, and one that passes through life without a knowledge of the feathered creatures constantly surrounding him in the fields and woods, rendered vocal with their songs, watching the patience and care in providing for their young, loses one of the chief means by which his own existence might be made more cheerful, happy, and contented, and fails to understand one of the most pleasing and attractive of the creations of Omnipotence. How important for the sportsman to know the history and habits of his feathered friends, so as not to be led to slaughter them out of season. And the agriculturist, after failing crops and barren fields, only learns the errors he has committed in the destruction of his little feathered helpmates by the life and vigor it has given the grubs and insects that now overrun his fields. And now, with the help of the FOREST AND STREAM, that I hope may go into every family, we may try to surpass our English friends in the study of natural science, and know the benefits of out-door recreation and physical culture. Yours very truly,

GEORGE A. BOARDMAN, (Naturalist.)

[Correspondence of the N. Y. Sun.]

HUNTING JACK RABBITS.

CAMP DOUGLAS, UTAH, August 26th, 1873.

A FEW months ago Mr. J. E. Moen, a Wall street broker, came out here to look at some mines in which he was interested. Moen was accompanied by the Hon. Amasa Mason, a London banker from Rochester, New York. They found snug quarters in Camp Douglas, and recognized the faces of a few old acquaintances among the officers. One of these was the face of Major David S. Gordon, Colonel Tompkins' right bower in the celebrated cavalry charge at Fairfax Courthouse. Another was the refulgent countenance of Major Howell, a jovial son of Mars, who was planted in the Quartermaster's Department some years ago by General Rufe Ingalls, and who has taken deep root in the service of the republic. A third face was that of Captain Dinwiddie, a handsome Hoosier, who once spent forty-seven days in the gloomy depths of the Black Canon of the Colorado. Moen and Mason were heartily welcomed to the festive boards of these three epauletted worthies. At one of their liquid meals Moen said he had brought a five hundred dollar (in gold) gun with him out here in hopes of shooting something before he returned to New York.

"Did you ever see a jack rabbit, Moen?" asked Gordon. "No," Moen said, "but I've heard of them, and would give fifty dollars for a shot at one. Are there any of them about here?"

"Oh, lots of them," exclaimed Rufe Ingalls' military plant. You mustn't go back to New York without taking one of their hides along with you."

"I'll tell you what we'll do," said Gordon, "American Fork is full of jack rabbits. To-morrow morning we'll hitch up an ambulance and ride over there. Moen is sure to get a shot at one. What do you say, gentlemen? Will you go?"

"Go," repeated Mason, "of course we'll go. What do you think we came out here for? I'd like to see a jack rabbit myself. How large are they?"

"Well," drawled Gordon, "they're about the size of a young colt. When they start on a run they've got the queerest lope that you ever saw. They pop over the ground as though they had the spring halt in every leg."

The whiskey went round once more, and a little more

intellectual conversation followed. The party then separated, but were brought together again by the power of attraction, all declaring that a nightcap was necessary before going to bed. After the nightcaps had been secured each man crept beneath his blankets, and the cool air was quickly filled with music. They snored so loudly that the corporal of the guard turned out his men, under the impression that the horses in the camp stables were suffering from the distemper.

Day dawned clear and beautiful. The five men were in an ambulance by sunrise. They were happy. Five morning cocktails had warmed their souls. The scenery was magnificent. The great valley of the Salt Lake, checkered with squares of yellow grain and green grass, and hemmed in by turreted mountains, was spread out before them. The lake itself glistened at the base of the far-off mountains like an immense mirror. Entranced at the scene, the men halted, and gazed at it through the bottom of a black bottle. "Glorious, grand affair!" rapturously exclaimed the Wall street operator, waving his hand over a sea of sage brush. Dinwiddie lashed the mules, and the ambulance ran down hill with the speed of a Texas steer. Moen's gun attracted great attention. All handled it, and squinted along its barrels. The lock was clicked a hundred times. If the gun had been a second bottle of whiskey it could not have been handled more lovingly, or its good points more expatiated upon. Moen was delighted, and Mason regarded the experienced army officers and their bottles with an affection bordering on veneration.

It was well along in the afternoon when the ambulance began to roll up the American Fork canon. A bright watch was kept for jack rabbits. They were scarce. Hours passed, and none were seen. Moen became dispirited. At last, about five o'clock, Gordon saw two ears, sticking up above a clump of bushes on the side of a hill.

"Hold on," he shouted, "there's one now. He's a big one, too. Get out, Moen, and give it to him. Easy, now, easy."

The Wall street gentleman slinned out of the wagon and shoved two patent cartridges into the barrels of his gun.

"Now, then, let him have it. Give it to him," repeated Gordon.

The army officers began to laugh as Moen rested the fowling piece upon the wheel of the ambulance and squatted to take sight. They saw that the supposed jack rabbit was a jack without the rabbit. It was a *burro*, or Spanish donkey, about two-thirds grown. Moen had never seen one. The animal stood with its quaint face surrounded by green leaves, a perfect picture of contentment. The banker took good aim and fired. The *burro* threw up its ears, but never budged an inch.

"You shot too high," said Howell. "Shoot lower, and you'll fetch him. I never saw a bigger one. He's the king of all jack rabbits. Now, then, give it to him, quick!"

The banker squatted again, and sighted his game over the wheel. There was a puff of smoke and a report. The *burro's* ears flew up a second time, but he didn't stir.

"Too low, too low, old man," cried Gordon. "Load up again and give him another shot."

"Heavens!" exclaimed Moen, ain't he a big fellow?" He nervously shoved the cartridge into his fowling piece.

"Keep quiet, boys," he whispered, "don't scare him."

"Now, then, give it to him sure," Gordon said in a low tone of voice, as the broker squatted for a third shot. As his finger touched the trigger the *burro* threw one of his ears over his eyes and began to bray. "Y-a-a-w e-e-e-h! y-a-a-w e-e-e-h" shouted the jack. The officers burst into a roar of laughter.

The Wall street man straightened up in an instant. "Great Caesar," said he, "it's a cursed jackass! I came near killing it."

He jumped into the ambulance and put up his gun. The best of the joke is, that the jack belonged to an old Mormon, who collected \$25 from Moen, alleging that he had shot the beast near the root of the tail, seriously damaging him. After the banker returned to New York Davis acknowledged that the animal was untouched.

"The bullets didn't go within a mile of the jack," said he, "but what is a New Yorker good for in this country if it isn't to pluck. I plucked him."

A DANGEROUS INDIAN BOY.

MAJOR Benteen, in leading the attack of his squadron through the timber below the village, encountered an Indian boy, scarcely fifteen years of age; he was well mounted, and was endeavoring to make his way through the lines. This boy rode boldly towards the Major, seeming to invite a contest. His youthful bearing, and not being looked upon as a combatant, induced Major Benteen to endeavor to save him by making "peace signs" to him and obtaining his surrender, when he could be placed in a position of safety until the battle was terminated; but the young savage desired and would accept no such friendly concessions. He regarded himself as a warrior, and as such he purposed to do a warrior's part. With revolver in hand he dashed at the Major, who still could not regard him as anything but a harmless lad. Levelling his weapon as he rode, he fired, but either from excitement or the changing positions of both parties, his aim was defective and the shot whistled harmlessly by Major Benteen's head. Another followed in quick succession, but with no better effect. All this time the dusky little chieftain boldly advanced, to lessen the distance between himself and his adversary. A third bullet was sped on its errand, and this time to some purpose, as it passed through the neck of the Major's horse, close to the shoulder. Making a final but ineffectual appeal to him to surrender, and seeing him still preparing to fire again, the Major was forced in self-defence to level his revolver and despatch him, although as he did so it was with admiration for the plucky spirit exhibited by the lad, and regret often expressed that no other course under the circumstances was left to him. Attached to the saddle bow of the young Indian hung a beautifully wrought pair of small moccasins, elaborately ornamented with beads. One of the Major's troopers secured these and presented them to him. These furnished the link of evidence by which we subsequently ascertained who the young chieftain was—a title which was justly his, both by blood and bearing.—General Custer's *Life on the Plains—Galaxy*.

—The preservation of game irrespective of size, seems to be now the rule. On the first of October in the Presidency of Madras, any one killing an elephant will be fined 500 rupees. Elephant pot hunters being now fully warned, will have no excuse.

GENERAL GRANT AND HIS FOUR-IN-HAND.

AT Long Branch, in the season, there is often to be witnessed a very fine display of "turnouts" upon what is known as the Ocean avenue. It is a source of pleasure to see the women in their little dog-carts, and fancy calashes, handling the reins; they are so earnest and so full of enjoyment. The men do not always please us; they too frequently appear nervous in their seats; there is also a lack of responsive mental sympathy playing along the reins, between the horses and their master. A high-spirited horse and a brave, dashing woman understand each other on sight; but a man must show his common-sense and magnanimity to a horse, before he can command his sympathy. To manage a spirited team well, the members of it should be intimately acquainted with the driver, not only bear his society—for they cannot help that—but they must entertain for him a solid respect.

The equine show at the Branch came to an end with the disappearance of the sun; the butterflies left the moment the cool sea air chilled their wings. Only the solid establishments remained to the last. When we were turning away, the unexpected sight of a "four-in-hand" came down the road, moving silently in the twilight, as if from the spirit land. The heavy vehicle was almost quaint in its fashion, the horses were in fine condition, but evidently aged, and in form and color they did not match; but they moved together with the precision of a perfect piece of machinery. On the seat was a gentleman of most modest appearance, so immovable that, but for the wreath of the fragrant Havana which came from his firmly set mouth, he might have been of stone. But the reins he held seemed to be the heart-strings of the noble animals which, with such dignified action, sped on their way. In another instant the vehicle, the fluttering of a costly shawl, together with horses and driver, were lost in the gathering darkness down the road. Presently this four-in-hand returned, the horses more spirited—they were now homeward bound. That unpretentious turnout, those well cared for and obedient horses, that firm hand, that silent movement, that delicate wreathing cloud of smoke, could represent the personal peculiarities and surroundings, as the reader must anticipate, of no other person than General Grant.

In common with our fellow-countrymen at large, we had heard of General Grant's fondness for horses. Close as he keeps his mouth, and as reticent as he is regarding his likes and dislikes, he has betrayed himself as an ardent lover of horse-flesh. Here we have at least one opening into his heart, through which to study his real nature. We never heard it to be else than noble to admire the horse; it's a royal failing, it's a manly weakness. General Grant may in charity, therefore, be pardoned for his foible, it has been in such good company through all times; but as a Republican Chief-Magistrate, he should, we thought, not affect extravagance in keeping up a stud, nor waste money on equipages which, from costliness, are offensive to public taste, and an outrage upon the simplicity of our political institutions!

General Grant was brought up in the country, where it was convenient and useful to be always riding. At West Point, as a cadet, without any pretention, he was, for all practical purposes, the best rider in the school. This was, in his case, a most fortunate predilection, for as commander of our armies, he was always in the field. While other officers used ambulances to relieve themselves of the severity of constant horseback exercise, General Grant pertinaciously stuck to his saddle. From Petersburg to Appomattox Court-house, his "official residence" was only the "fly" of a common tent. His table was literally "soldiers' fare;" one substantial dish was only demanded; even with this simple food he ate sparingly; no stimulants were ever used. There was one time when not one of his generals or subordinate officers on his staff had any liquor for an entire year and two months. He never used it himself nor offered it to others.

Passionately fond of riding, and with the physical ability to perform it, for he possesses an iron constitution, as well as an iron will, he was enabled to personally inspect his military lines. While engaged in this important duty, he often rode from forty to fifty miles a day. In the excitement of the hour he frequently left his staff in the rear, and his whereabouts to its members, after hours of solicitude, was made known by discharges of shot and shell from the observing enemy. To accomplish this herculean labor, he took a horse in the morning, sending forward the reliefs with the "head-quarters," so that when he "tired out" one animal another was at hand; for himself he had no relief, and apparently never needed one.

He made it his practice while in the field, to personally look after his horses, while in care of the groom, and he keeps up this humane practice (which Mr. Bergh should notice) since he has been President. He has no recreation which he thoroughly enjoys, except riding or driving; if not thus engaged he is hard at work.

Soon after the fall of Vicksburg certain citizens of Indiana determined to present General Grant a horse. A subscription was at once set on foot, the highest amount given toward the object, by one person, was limited to one dollar. The committee entrusted with the purchase heard that there was a very fine animal for sale at a fair in Kentucky; that land of fine stock, and made an especial trip to purchase, if the horse answered the demand. The "phenomenon" turned out to be lame, and wholly unserviceable. By a happy accident, a horse, quite modestly exhibited under the name of "Egypt," was noticed, approved of by the committee, purchased, and presented to the General.

This horse, and Cincinnati, "a full-blooded Lexington," also a gift from friends, General Grant took with him from the fall of Vicksburg, and they were active participants in every subsequent engagement.

The Jeff. Davis mare, as she is called, picked up on the banks of the Mississippi, being first-rate under the saddle, did a great deal of hard work. General Grant was riding this generous creature outside the Union lines, when General Lee sent his message, expressing a desire for a meeting, on Sunday morning, the memorable 9th of April. When Mr. Lincoln paid a visit to the "head-quarters" of the army, he selected Cincinnati for his steed.

These three horses of historic importance, except two others, are all General Grant has possessed since his advent as General and Chief-Magistrate. All were presented to him by friends while holding the place of a Commanding General. When he drives "four-in-hand" his "drag" is the heavy wagon we have alluded to, which "he owned before the war." Egypt and Cincinnati, both seventeen or eighteen years old, are in the lead. Such is the "imperial carriage" and such the "costly stud," about which so much is written, and published in the columns of the "Argus-eyed press."

Soldiers are passionately fond of their war horses. Wellington, for years kept the one he rode at Waterloo under his personal care, and when it died he erected a tablet over its burying-place. General Taylor treated "Old Whitey" as a companion and friend. What is General Grant to do with Egypt and Cincinnati else than nurse them to their end? and what better horses can he have in the lead than these equine veterans, who, through their long career of military service, were trained to keep the front?

COL. T. B. THORPE.

The Magazines.

A PLEA FOR PEDESTRIANS.

THE human body is a steed that goes freest and longest under a light rider, and the lightest of all riders is a cheerful heart. Your sad, or morose, or embittered, or pre-occupied heart settles heavily into the saddle, and the poor beast, the body, breaks down the first mile. Indeed, the heaviest thing in the world is a heavy heart. Next to that, the most burdensome to the walker is a heart not in sympathy and accord with the body. The horse and rider must both be willing to go the same way. This is no doubt our trouble, and the main reason of the decay of the noble art in this country. As a people we are not so positively sad, or taciturn, or misanthropical, as we are vacant of that sportiveness and surplussage of animal spirits that characterized our ancestors, and that springs from full and harmonious life—a sound heart in accord with a sound body. A man must invest himself near at hand and in common things, and be content with a steady and moderate return, if he would know the blessedness of a cheerful heart and the sweetness of a walk over the round earth. This is a lesson the American has yet to learn—capability of amusement on a low key. He would make the very elemental laws pay usury. He has nothing to invest in a walk; it is too slow; too cheap. We crave the astonishing, the exciting, the far away, and do not know the highways of the gods when we see them—always a sign of the decay of the faith and simplicity of man.

If I were to say to my neighbor, "Come, let us go walk amid the heavenly bodies," he would prick up his ears and come forthwith; but if I were to take him out on the hills under the full blaze of the sun, or along the country road, our footsteps lighted by the moon and stars, and say to him, "Behold, these are the heavenly bodies, this we now tread is a morning star," he would feel defrauded, as if I had played him a trick. And yet nothing less than dilatation and enthusiasm like this is the badge of the master walker.

If we are not sad we are careworn, hurried, discontented, mortgaging the present for the promise of the future. If we take a walk, it is as we take a prescription, with about the same relish and with about the same purpose; and the more the fatigue the greater our faith in the virtue of the medicine.

Of those gleesome saunters over the hills in spring, or those sallies of the body in winter, those excursions into space when the foot strikes fire at every step, when the air tastes like a new and finer mixture, when we accumulate force and gladness as we go along, when the sight of objects by the roadside and of the fields and woods pleases more than pictures or than all the art in the world—those ten or twelve mile dashes that are but the wit and effluence of the corporeal powers—of such diversion and open road entertainment, I say most of us know very little.

I notice with astonishment that at our fashionable watering-places nobody walks; that of all those vast crowds of health-seekers and lovers of country air, you can never catch one in the fields or woods, or guilty of trudging along the country road with dust on his shoes and sun-tan on his hands and face. The sole amusement seems to be to eat and dress and sit about the hotels and glare at each other. The men look bored, the women look tired, and all seem to sigh, "Oh Lord! what shall we do to be happy and not be vulgar?" Quite different from our British cousins across the water, who have plenty of amusement and hilarity, spending most of their time at their watering-places in the open air, strolling, pic-nicking, boating, climbing, briskly walking, apparently with little fear of sun-tan or of compromising their "gentility."—"Exhibition of the Road," by John Burroughs, in *Galaxy*.

DUMAS PETS.—When Dumas was a young man, he lived with his mother in the *Rue de l'Ouest*, and they had a cat, called Mysouff, which ought to have been a dog.

Every morning, Dumas left home at half-past nine—it was half an hour's walk from the *Rue de l'Ouest* to the office in the *Rue St. Honore*, No. 216—and every afternoon he returned home at half-past five. Every morning Mysouff accompanied his master as far as the *Rue de Vaugirard*; and every afternoon he went and waited for him at the *Rue de Vaugirard*. Those were his limits; he never

went an inch further. As soon as he caught sight of his master, he swept the pavement with his tail; at his nearer approach, he rose on all-fours, with arching back and tail erect. When Dumas set foot in the *Rue de l'Ouest*, the cat jumped to his knees as a dog would have done; then, turning round every ten paces, he led the way to the house. At twenty paces from the house, he set off at a gallop, and two seconds afterwards, the expectant mother appeared at the door.

The most curious circumstance was, that whenever by chance any temptation caused Dumas to neglect his mother's dinner hour, it was useless for her to open the door; Mysouff would not stir from his cushion. But on the day when Dumas was a punctual good boy, if she forgot to open the door, Mysouff scratched it till she let him out. Consequently, she called Mysouff her barometer; it was Set Fair when Dumas came home to dinner, Rain or Wind when he was absent.—*All The Year Round*.

MOSS GATHERING.

AMONG the articles of commerce furnished by nature in this semi-tropical climate of ours, says the *New Orleans Times*, is moss. This long, luxuriant parasite clothes and festoons the trees, with its dull drapery all over the woods and swamps of lower Louisiana. The same humidity and warmth in the atmosphere which deprives man of the will to work, foster and nourish the growth of this strange plant, and thus affords him, if he would avail himself of the opportunities, an easy way of making a living. The supply of moss in our forests is simply inexhaustible. There are trees loaded down with it standing on thousands of square miles in this State, and even when the tree is denuded of this weird-like garb, in less than a year it comes out in a dress as ample as that of which it had been stripped. The waters of all our swamps are filled with it, where it has dropped from the trees, and lies rotting, ungathered, and uncared for. The whole country where this moss grows is accessible to any one desirous of turning it to account. Bayous and streams navigable for large boats intersect the woods and swamps where it grows, in every direction. But strange to say, this moss interest, which might be made so great here, is neglected, although it presents so many inducements to those who are desirous of gaining an honest livelihood.

Most of them, with that prodigality and wastefulness which are part of the nature of our people, cut the trees down to gather the moss on them, and thus kill the goose which lays the golden eggs, without even eating the goose, for they leave the tree to rot where it lies, after stripping it of its sombre covering. But some of them are more economical, and, having an eye to future wants, more properly climb the trees among the moss, which they gather off the limbs and throw to the ground in a pile. These heaps are left standing for sometime, and the rain, with the dews, thoroughly saturating them, they undergo a species of "sweating," like tobacco, which rots off the gray covering and leaves the black, fibrous horse-hair like material, which is the moss of commerce. This is usually transported to market in flats and boats of the swamps. It is packed up near the place of curing in rude bales with rope ties. When it arrives in New Orleans it passes under the manipulation of moss pickeries and through the machinery of gins, after which it is pressed into bales under steam pressure, bound with neat iron ties and is then ready for shipment. The men who gather this moss usually live on the banks and islands of the bayous which lead through the swamps. Most of those at present engaged in it are Germans and Creoles, who live very comfortably on the spots of high land which are found almost everywhere in the swamp country of Louisiana. They prepare their moss in rather a rough manner to be sold advantageously in the New Orleans market, but there the "country moss," is nearly always rehandled and refined as it were by the exporters of Louisiana moss. After the necessary preparation is made with the rough material these parties find no difficulty in selling their moss in the northern markets.

A WHALE KILLED BY A SUBMARINE CABLE.—A break in the submarine cable between Kurrachee and Gwadoier, British India, has developed the most surprising and veritable "fish story" of recent date. On the 4th of July the cable suddenly failed, and the interruption was discovered to be at a point 118 miles from Kurrachee, where the cable passes over a very uneven and rocky bottom, and a steamer with the telegraph repairing staff on board was despatched thither. The cable was grappled at once, but on winding it in, unusual resistance was experienced, as if it was foul of the rocks. After persevering sometime, the body of an immense whale was brought to the surface, the fish being entangled in the cable, two turns of which passed round its body immediately above the tail. The whale had evidently struggled long and hard to release itself, and, dying in the effort, had become a prey to sharks and other fish, which had devoured a large portion of it. The strain, in course of hauling the cable, caused it to cut through the monster, and the carcass sunk in deep water. The size of the fish may be judged from the fact that its tail measured twelve feet across. It is supposed that the whale had found a festoon of the cable stretching from a submarine precipice, and had been endeavoring to wipe the barnacles from its sides by rubbing against the rope, when the tail became entangled. The first part of the operation was fully illustrated to those on board the telegraph ship, for as they lay at anchor a number of whales played around, and rubbed themselves against the hawser by which the vessel was secured. This incident, so surprising in every way, shows how liable the means of cable communication are to be cut off any moment by the gambols of the monsters of the great deep.

A PERSIAN JOKE.—"One day Hafiz was in the baths at Pabreez, when he met a stranger, who entered into conversation with him, and presently began to 'chaff him on his baldness.' (Now, though Mohammedans shave their heads, they ordinarily leave a small tuft of hair, or forelock, in front and, of course, the hair quickly grows again, except where there is natural baldness, as in this case.) The stranger took hold of one of the round tin shaving vessels used in the bath, and holding it out to Hafiz, exclaimed: 'How comes it that all you Shiranzees have the top of your heads like this?' 'And how happens it,' retorted Hafiz, turning the bowl with its cavity upwards, 'that all you Tabreezes have the inside of your heads like that?'"

Woodland, Lawn and Garden.

HEDGES AND THEIR USES.

NO. IV.—THREE SPRUCES.

Where to the eye three well marked distances
Spread their peculiar coloring—vivid green,
Warm brown and black opaque the foreground bears
Conspicuous; sober olive coldly marks
The second distance; thence the third declines
In softer blue, or lessening still, is lost
In faintest purple. When thy taste is called
To deck a scene where nature's self presents
All these distinct gradations, then rejoice
As doth the painter, and like him apply
Thy colors; plant thou on each separate part
Its proper foliage."

BLACK SPRUCE (*nigra*).

WHITE SPRUCE (*alba*).

BALSAM FIR (*picea*).

The fir and spruce trees belong to a family quite readily distinguished from the pine species, and from their general and botanical characters are well known to the most casual observer. They have shorter leaves than the pine, and their leaves are not arranged in fascicles like the pine, but singly and in rows. This wise provision of nature enables these branches and leaves to offer a greater resistance to external influences, strong currents of air, than the more graceful yielding branches of the pine; and for this reason are better adapted for a sheltering barrier of protection to certain localities than the pine tree, beautiful as it is when nicely planted and skilfully cultured. The seed cones of this truly American species are very peculiar in themselves, being smaller than any other cone, and of great compactness of character, ripening their seeds every year. The fir cones or seed vessels stand erect, perpendicular upon its stalks. The cones of the spruce are hung like pendants beneath the branches, and are of less compact character. So much is necessary to the right understanding of the plants we use, and for the uses we intend to put them, either as a low hedge or separation line, or a barrier line, to battle with the elements, or for the ornamental decoration or beautifying of the *woodland, lawn or garden*—while the most beautiful hedges may be grown from the planting of almost any of our common and well-known species of hardy evergreens and shrubs, of which we have a great number,—yet all are not equally valuable for the low hedge.* We notice in this paper the trees and tree plants best adapted for heavy screens intended to protect young trees and plants, such as pears and small fruits, peaches and apricots from strongly blowing winds from some particular quarter during the winter months. Much serious injury is received from this source alone in many parts of our Eastern States; the cold of our winters in some particular localities being frequently below zero, and sometimes continuing so low for days.

To mitigate this cold in a certain degree, requires all the art of the experienced culturist. I have before me at this writing the question: "Sir, I have a finely located piece of ground for the growing of small fruits, especially pear trees of the dwarf kinds. My grounds consist of an acre or more in extent laying between two high hills, and are completely protected on all side from the high winds except on the *northwest* side, which is open like the mouth of a tunnel. Through this opening the wind rushes like a tornado. No common board fence will long stand before it. What shall I do to remedy this? Some of my neighbors recommend hedging. Now no hedge will stand the wind any better than my old board fence. What shall I do and how shall I remedy this great loss of crops?" This letter bears date of May, 1850. I reproduce it as an illustration every way worthy the consideration of persons having similar locations, of which there are many in all our States. For the treatment of this "tunnel gap" between the hills I recommended to him the following plan, which he successfully carried into execution, introducing some of those other firs and spruces, as noticed in the heading of this paper.

"Sir—Your description of the locality described in your letter as well protected from high winds from without on all sides but one, is indeed the question you ask, 'How shall I stop the wind from blowing to pieces my fine tender trees through the mouth of this natural tunnel?'"

You cannot stop the winds blowing, but you have within your every day means, the remedy modifying in a very essential degree the cold and heat and drought, which often prove so destructive to the choice plants of the garden. In your own enclosure you have three sides already well secured by nature from all outward innovations. Now, as to the northwest, or windy corner, I recommend you to prepare a good deep trench, of say three feet in depth and two and a half in width, into which place for an inner row of barrier hedge the healthy plants of *black spruce*, say four feet in height, and these will be found to be quite a large sized plant, but not too large for your purpose. Set these plants seven feet distant from trunk to trunk, pressing the soil, which is supposed to be of good quality, firmly about them. After mulching the top of the ground in a thorough manner, *a sine qua non* with all evergreens in the hedge row at their first setting, leave them for the second row.† This

*We shall notice all the many varieties of the coniferous and other evergreens in the course of these papers, any and all having special reference to their adaptation to different situations on the lawn.

†We have in the course of our experience had many questions of a similar character asked, and a lack of knowledge of the general laws appertaining to the face of the country has been the source of much trouble to the owners of otherwise very desirable locations.

‡The black spruce in its native forest is considerably taller than the white spruce; but there is often difficulty in distinguishing between the two, yet the white spruce is a more beautiful standard than the black; and is often used in the manner I have here recommended as a third or even second row.

second row is to be set in precisely the same manner as the first, only you are to set them in *quincunx*, or break joint, or spaces, thus . . . ; the second row covering the break in the first, and in this manner, as you plant your barrier more or less wide, you soon make an impenetrable shelter from the highest winds. The second row is to be composed of white spruce trees, in plants like the first row. This second row is to be set at about ten feet distance from the first row, and the plants at same distance in the hedge row. Now, if you deem it advisable in your case, and I think the very exposed situation of your grounds demand a very firm barrier of resistance to the northwest current, you can use the balsam fir—a tree remarkable for its long life and greenness, beauty of form and foliage, yet inferior in height to the other before named trees. As a third row tree, or the outside row of your barrier, it will give you I think entire satisfaction. This row is to be planted in the same manner as you have planted the other two. You will mulch well, or in the most thorough manner, and you may rely with a good degree of confidence your work is a good work, and will give you satisfaction.

Thus you have all the elements of a *barrier hedge*—the largest hedge ever made; and if further embellishment is needed, you can set some arbor vitae and hemlock trees, say five or six of each small plants of one foot height on the outside of your barrier, or side next to the wind, at a distance of thirty or forty feet, or in an irregular manner; this not so much for use as for ornamentation, and to break up the monotony of the green mass before you.

Now, to return to the final treatment of your barrier, the clipping of the inside, or side next the field. I suppose you will have a walk, say of four feet width, running along side these spruce trees. Well, now begin the trimming process. There should be no trimming done to these inside branches the first year at all, except to shorten in a few inches any one or two very long branches. When you do begin to trim it is to be near the height of this barrier you desire, say, begin to clip in at six feet, and then gradually slope the branches as your taste may suggest. The sides of this soon to be impenetrable wall of compact greenness should be to the height of six feet perpendicular, and trimmed every season of any protruding or superfluous branches. The other trees composing this "windscreen" are not to be trimmed at all, but left to take the natural position of a natural forest, which in a few years they will, and you will find by a little careful labor and expense you have effectually stopped the mouth of your old enemy, the "northwest tunnel."

On the outside of this walk by the side of these evergreens, your pear, peach and apricot will live and thrive; and if we are not much mistaken, you will find your labor, expense and care not in vain.‡

We have made this illustration of the uses of three kinds of the spruce family for hedges from our practical notes; the practical use of which, we have no hesitancy in saying, can in most ordinary cases be relied upon as a paying work.

For a small hedge, which it is desirable to keep closely clipped, these spruces would perhaps occupy more ground than the proprietor would be willing to grant. But where a separation line or belt of hedge of ten feet or more in width can be given, there is no grander sight or more impenetrable line than these tall, well-clipped trees. Always green, always refreshing, and no insects of any account to prey upon or make it their home. We therefore urge upon our cultivators of the dwarf pear to put some three or four green lines of black and white spruce, in parallels, within their orchards, and our word for it they will find their account in it within two years from the planting of the same.

Of the other modifying influences to be derived from this arrangement we shall speak in its proper place and time.

OLLIPOD QUILL.

§In several instances where we have used the above arrangement, especially for field lines of separation and for the protection of pear orchards from wind, we have been successful.

CHOPPING DOWN THE REDWOOD TREES.

A *TRIBUNE* correspondent, from Mendocino county, California, gives the following most interesting account, how lumbering is carried on:

"To chop down a redwood tree, the chopper does not stand on the ground, but upon the stage, sometimes twelve feet above the ground. Like the sequoi, the redwood has a great bulk near the ground, but contracts a few feet above. The chopper wants only the fair round of the tree, and his stage is composed of two stout staves, shod with a pointed iron at one end, which is driven into the tree. The outer ends are securely supported; and on these staves he lays two narrow, tough boards, on which he stands, and which spring at every blow of his axe. It will give you an idea of the bulk of these trees, when I tell you that in chopping down the larger ones two men stand on the stage and chop simultaneously at the same cut, facing each other. They cut off the bark, which is from four to ten, and often fifteen inches thick. This done, they begin what is called the "undercut," the cut on that side toward which the tree is meant to fall; and when they have made a little progress, they, by an ingenious and simple contrivance, fix upon the proper direction of the cut, so as to make the tree fall accurately where they want it. This is necessary, on account of the great length and weight of the trees, and the roughness of the ground, by reason of which a tree carelessly felled may in its fall break and split into pieces, so as to make it entirely worthless. This happens not unfrequently, in spite of every care. So skillful are they in giving to the tree its proper direction, that they are able to set a post or stake in the ground a hundred feet or more from the root of the tree, and drive it down by felling the tree on top of it. "Can you really drive a stake with a tree?" I asked, and was

answered, "Of course, we do it every day." The "undercut" goes in about two-thirds the diameter. When it is finished the stage is shifted to the opposite side, and then it is a remarkable sight to see the tall, straight mass begin to tremble as the axe goes in. It usually gives a heavy crack about fifteen minutes before it means to fall. The chopper thereupon gives a warning shout, so that all may stand clear—not of the tree, for he knows where that will go, and in a cleared space men will stand within ten feet of where the top of the tree is to strike, and watch its fall; his warning is against the branches of other trees, which are sometimes torn off and flung to a distance by the falling giant, and which occasionally dash out men's brains. At last the tree visibly totters, and slowly goes over; and as it goes, the chopper gets off the stage, and runs a few feet to one side. Then you hear and see one of the grandest and most majestic incidents of forest life. There is a sharp crack, a crash, and then a long, prolonged, thunderous crash, which, when you hear it from a little distance, is startlingly like an actual and severe thunder peal. To see a tree six feet in diameter, and 175 feet high, thus go down, is a very great sight, not soon forgotten. *More than half the wood is wasted.*

The choppers expressed themselves as disappointed that they could not just then show me the fall of a tree ten or twelve feet in diameter, and over 200 feet high. In one logging camp I visited there remained a stump, fourteen feet high. At this height the tree was fourteen feet in diameter, perfectly round and sound, and it was sawn into seventeen logs each twelve feet long. The upper length was six feet in diameter. Probably the tree was 300 feet long, for the top for a long distance is wasted.

So many of the trees and so many parts of trees are splintered or broken in the fall, that the master of a logging camp told me he thought they wasted at least as much as they saved; and as the mills also wasted a good deal, it is probable that for every foot of this lumber that goes to market two feet are lost. A five foot tree occupies a chopper from two and a half to three and a half hours; when the tree is down the sawyers come. It is odd enough to go past a tree and see a saw moving back and forward across its diameter without seeing the man who moves it, for the tree hides him completely from you, if you are on the side opposite him."

Natural History.

CAPTURE AND PRESERVATION OF THE ANCHOVY.

AS enquiries have been made concerning the mode of capturing the Anchovy, we have jotted down a few memoranda on the subject, taken from the *Encyclopédie Méthodique, Poissons*, which though old are not the less trustworthy and practical. The volumes on Ichthyology were prepared by *Dechamel du Monceau*, and contain a mass of information no where else gathered together.

The anchovy is caught on dark nights well off shore from May to July in the Atlantic, and a month earlier in the Mediterranean. Several boats engage in the fishery, say four, of which there are five boats with a couple of men each, and one with the net, manned by four or five men. Dark nights without a moon are the most favorable, and the fire boats put to sea, first keeping one or two hundred yards apart. The fire is made in a raised brasier and must be seen in every direction. The boats choose a favorable position, generally six miles from shore, followed by the net boat. As soon as anchovies are seen coming around the fire, a signal is given and the net is shot so as to encompass the fire boat with the school of fish.

This net is of fine material, not over half an inch in the mesh, some forty fathoms long and four to seven fathoms deep. It is provided with floats and foot-leads and can be pursed at the foot rope if required. As soon as the net is closed the light is extinguished and the water is beaten, which scatters the fish and drives them into the meshes, where they are gilled.

The net is taken to the near fire boat that signals in, and sometimes very large hauls are made. Sometimes the fire boats alone go out and dexterously attract a whole school to the shore where they are led into a labyrinth.

This fish also frequents the mouth of rivers and may be taken in brackish waters. Smaller nets can be used, and the fishery may be conducted on quite a small scale with a torch and a white cloth spread on a frame dipped into the water around the boat. The little fish attracted by the light will spring out and fall on the cloth.

Sprats, sardines and brit are often found mixed with anchovies, and much trouble is sometimes caused by having to sort them out. Anchovies are much scarcer on the coasts of France than they were sixty years ago, and the smaller herring are sometimes treated so as to pass for anchovies.

Anchovies are salted in a peculiar manner. The head and entrails (which are bitter) are torn out, and they are then packed closely in casks back up, between layers of ground salt, the last layer being colored with a little ochre. The cask is then headed up, a hole being left in the head and foot, and the cask is raised on a frame so as to allow the drippings to be collected. A fermentation then takes place, and during this process the head of the cask is kept supplied with strong brine, and no rain is allowed to fall on it. In Holland the fish are repacked thrice in new salt and the process is most carefully watched, the smell from the cask indicating the state of the operation.

The fish ought not to be eaten for three months after completing the process, and will keep for a year or more in proper order.

Anchovy paste is made from fish which have been cleaned as above, and also by removing the fins, tail and backbone, the fish being then salted with red salt, much as before, and then ground into paste.

Anchovy sauce is variously prepared. It is believed with

good reason that the famous *Garum*, or salt fish sauce of the ancients, was this preparation.

Rondelet the ichthyologist, prepared garum by macerating anchovies in oil and vinegar, spiced and seasoned, with chopped parsley added, over a slow fire.

The great *Dictionnaire des Pêches*, recently published, adds nothing to the facts we have gleaned and put together, but the subject may be again noticed in these columns, as the anchovy abounds on our coasts, and their capture may be undertaken as a remunerative industry.

J. CARSON BREVOORT.

COLLECTIVE INSECTS.

THE writer of one of the books on Indian sport relates how he saw a herd of antelopes driven backwards and forwards by four wolves, which surrounded the herd, each guarding a different side, until at length the antelopes passed over a ditch in which a fifth wolf lay concealed. This wolf, jumping up as the antelopes crossed, secured one of them, upon which his four companions joined him, and assisted in making a meal of the captured animal.

A friend in India told me that he witnessed a very similar occurrence in Ouda. He saw two wolves standing together, and shortly after noticing them was surprised to see one of them lie down in a ditch, and the other walk away over the open plain. He watched the latter, which deliberately went to the far side of a herd of antelopes standing in the plain, and drove them, as a sheep dog would a flock of sheep, to the very spot where his companion lay in ambush. As the antelopes crossed the ditch, the concealed wolf jumped up, as in the former case, seized a doe, and was joined by his colleague.

I have noticed some similar instances of collective action on the part of other animals which I believe to be as much inherited as the habitual actions of individual animals. I have constantly seen a flock of pelicans when on the feed form a line across a lake, and drive the fish before them up its whole length, just as fishermen would with a net. The capture of the fish is rendered doubly easy by this method. I have witnessed exactly a similar plan pursued by a large number of Ganges crocodiles which had been lying or swimming about all day in front of my tent, at the mouth of a small stream which led from some large inland lakes to the Ganges. Towards dusk, at the same moment, every one of them left the bank on which they were lying, or the deep water in which they were swimming, and formed line across the stream, which was about twenty yards wide. They had to form a double line, as there was not room for all in a single line. They then swam slowly up the shallow stream, driving the fish before them, and I saw two or three fish caught before they disappeared.—E. C. BUCK, in *Nature*.

A BATTLE IN THE AIR.

THERE was a terrific battle between two large brown eagles in the vicinity of the lakes above Virginia on Wednesday evening. When first seen the birds were soaring, one above the other, at an altitude of perhaps three-fourths of a mile, and seemed on a sail for pleasure. Presently the uppermost bird, closing its broad wings, shot downward like a meteor for two or three hundred feet, and with a wild, piercing scream lit fairly upon the back of the other bird. Turning with the rapidity of lightning the victim clutched its adversary with talons and beak, and a fierce struggle ensued. The savage yells, the striking of huge wings, and showers of falling feathers gave unmistakable evidence of the ferocity with which the contest was waged.

As they fought they fell earthward, and within five hundred feet of the ground they became disentangled, and each swooped upward again. Now followed an interesting trial as to which should first gain a sufficient altitude to make another plunge. The circling of the smaller bird was rapid and close, while that of his antagonist was made with greater limits, and his ascension was quickest accomplished. The largest eagle was fully one-half mile high, and some hundreds of feet above his victim. Hovering in mid-air for a moment, as if making sure of his aim, he again darted with a force that seemed sufficient to kill of itself. Again they grappled and fought like winged demons—whirling, falling, and striking furiously for two or three minutes. They were now near the largest of the lakes, and gradually descending to the water. The struggles of the smaller became less and less fierce; he was getting weak, and was evidently nearly vanquished, while his more powerful enemy seemed to wage the battle with increased vigor.

Another moment and the conquering monarch loosed his hold, and with an exultant shout of victory soared upward. The battle was ended; his prisoner, limp and lifeless, fell into the waters of the lake with a splash, and floated on the surface without a struggle.—*Virginia City Montanian*.

A CLEVER PIGEON.—A correspondent of "*Nature*" writes as follows:

Having occasion to wait for my pony to be harnessed at an inn a few years since, my attention was directed by a gentleman (a resident of the neighborhood) with whom I was acquainted, to the strange conduct of a pigeon.

A number of them were feeding on a few oats that had been accidentally let fall while fixing the nose-bag on a horse standing at bait. Having finished all the grain at hand, a large "Pouter" rose, and flapping its wings furiously, flew directly at the horse's eyes, causing that animal to toss his head, and in doing so, of course shake out more corn. I saw this several times repeated; in fact, whenever the supply had been exhausted.

I leave it to your readers to consider the train of thought that must have passed through the pigeon's brain before it adopted the clever method above narrated, of stealing the horse's provender.

The Middletown *Mercury* tells the following: A gentleman who took a ride last Sunday, passed Thompson's Pond. There, he tells us he saw a strange sight. A snake was working its way under a stone in the water, and a few feet off a pickerel, with open mouth and hungry eye, lay watching the aforesaid snake. When it thought that a propitious moment had come, it started for the snake and grabbed it by its tail. The snake turned and grabbed the pickerel by the same appendage, and the water foamed in their struggles. The issue was that the snake swallowed the pickerel, and the pickerel swallowed the snake, and peace once more reigned in Glenmore.

Prof. Mobius has been studying the food of the herring, and has determined that they feed on a minute crustacean animal closely allied to the fresh water cyclops. Some idea of the number of these crustaceans eaten by the herring, may be gathered from the fact, that in one instance, 61,000 were found in a herring's stomach. The apparatus, which enables the herring to feed on these minute creatures, is described by Prof. Mobius as a sort of basket or "lobster-pot," formed by the arches of the gills, each of which is furnished with a close set fringe of teeth, while each of the latter bears two rows of minute spines. The interlacing of these teeth and spines produces a narrow lattice-work, through which the water can readily pass, while the little swimming animals contained in it are left behind in the mouth of the fish and gradually pass down into its stomach.

✕ ELEPHANTINE FOOT-STOOLS.—Elephants' feet make capital footstools; when required for this purpose they should be cut off a few inches below the knee, cleaned and well rubbed inside and out with arsenical soap. They will keep in this state till the sportsman's return to head-quarters, when, if hard, they must be softened in water, and again rubbed with arsenical soap, and kept in the sun filled with fine sand, all shrinking or loss of shape being prevented by ramming the sand daily. When thoroughly hard and dry, which will not be under six weeks, the sand must be removed, and the feet stuffed with coir, the nails being well polished, and the whole varnished. They may then be covered with panther skin, secured round the edge with large-headed brass nails, or with velvet or other material, which should be allowed to droop amply round the edges.—*Field*.

The Kennel.

FIELD AND WATER SPANIELS.—The field spaniel is remarkable for the intense love which it bears for hunting game, and the nervous manner in which it carries out the wishes of its master. There are two breeds, the one termed the "Springer" being used among the thick scrub oak and brambles, and the other employed principally on woodcock, and therefore called the "Cocker." Some of these dogs continually give tongue while engaged in pursuit of game, and utter different sounds, according to the description of game which they have reached, while others are perfectly mute. Each of these qualities is useful in its way—it should not be too noisy, and the note should be musical. While hunting the spaniel sweeps his well feathered tail from side to side, never carrying it as high as the back, and is a very pretty object to any one who has an eye for beauty. A spaniel must possess a thick coat, as it is subject to continual wetting from the drippings of the scrub oaks, &c., through which he has to force his way; he should weigh not less than fourteen pounds, and may with advantage weigh thirty pounds, as do the breed known by the name of "Clumber;" these animals work silently. The Cocker is a much smaller animal; his average weight is about fifteen pounds. He is an active and lively dog, dashing about its work with an air of gay pleasure that assists materially in adding to the spirits of his master, and will be found the most useful animal for woodcock in the fall.

THE WATER SPANIEL, in all weathers and in all seasons, is ever ready to take to its almost natural element. He is an admirable diver, swift swimmer, and is greatly assisted in these arts by the breadth of its paws. Much of these qualities in the dog is owing to the abundant supply of natural oil with which his coat is supplied, and which prevents it from really becoming wet. A real water spaniel gives himself a good shake as soon as he leaves the lake, and is dry in a very short time. This oil, although useful to the dog, gives forth an unpleasant odor, and therefore debars him from becoming an inmate of the house; so much the better. Some people fancy that the water spaniel possesses web feet, and that his aquatic prowess is due to this formation. Such is not the case. All dogs have their toes connected with each other by a strong membrane, and when the foot is wide, and the membrane rather loosely hung, as is the case with the water spaniel, a large surface is presented to the water. This dog is of moderate size, measuring about twenty-two inches in height at the shoulders, middling stout, ears very long, measuring from point to point about the animal's own height. This dog is of the utmost value to the sportsman who is shooting along bayous, creeks, marshy lakes, &c., after widgeon, teal, and mallard, as he saves many a wet foot and an infinite deal of unpleasant labor, and is without exception the best water retriever.

—The Hon. S. L. M. Barlow owns a pair of thoroughbred Scotch deerhounds, male and female. Their sinewy limbs, deep chests, slim muzzles, intelligent faces, and kindly dispositions make them ornamental additions to a gentleman's country seat, and assert their claim to lineal descent from the stag hound that lives in poetry as the companion of Sir Walter Scott. Being dogs of good education, as well as blue blood, they seldom leave their master's residence, and treat less favored quadrupeds with lofty contempt. About a week ago the male, who wags his tail to the name Walter, followed the farm cart to a neighbor's house. A very large and ferocious mastiff possessed prior dog privileges there. Instead of receiving his visitor with becoming hospitality he assaulted him savagely, and in a few minutes injured him so badly that he was carried home in the cart. The mastiff's teeth had inflicted a bad wound in Walter's chest, almost perforating it from side to side. He refused to submit to human surgery, but tried a remedy taught him by instinct. In the moist earth on the border of a fish pond he dug a hole that just fitted his breast. He chose a shady place for his hospital, and never left it, except for his meals, until he was cured. During the tedious hours of convalescence his mate was constantly with him. After five days he considered himself well. Then the pair went from the house, and going straight to where the mastiff lived, without warning or giving him any other living

show, they set upon him. The fight was short, sharp, and decisive. Before their victim's owner could render assistance they had torn the mastiff limb from limb. After seeing that their work had been well done they turned and jogged home.—*Sen*.

—The following recipe, it is alleged by Franklin Dryre, of Galena, Maryland, is a sure cure for hydrophobia, the lives of many bitten persons having been saved by its use: "Elecampane is a plant well known to most persons, and is to be found in many of our gardens. Immediately after being bitten take one and a half ounce of the root of the plant—the green root is perhaps preferable, but the dried will answer, and may be found in our drug stores, and was used by me—slice or bruise, put into a pint of fresh milk, boil down to a half pint, strain, and when cold drink, fasting for at least six hours afterwards. The next morning, fasting, repeat the dose, using two ounces of the root. On the third morning take another dose, prepared as the last, and this will be sufficient. It is recommended that after each dose nothing be eaten for at least six hours.

—"Fond du Lac" will find our reply to his question under our answers to correspondents.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

JESSE.—The gray squirrel can be found in almost any of the large woods of Pennsylvania in the neighborhood of Philadelphia and sometimes in abundance. No pinnated grouse or prairie hens in Pennsylvania except on the Pocono Mountains and in one or two of the northwestern counties. The ruffed grouse is called pheasant in that State, a much prettier and more proper name. The quail or Virginia partridge can be shot in some counties only. The exterior counties are the best. Pennsylvania sportsmen generally go to Delaware and Maryland for quail.

LONG JOURNEY, Brooklyn.—For South America, we know of no protection from mildew in tents. Best thing would be to take some native process. At home we have used linseed oil alone with success, putting on as many as three coats. We have heard of a preparation of soft soap, and solution of oxide of iron, put on the tents, to be followed by linseed oil, but have no faith in it.

MISS E.—Your mocking bird we think can get rid of the pest of vermin by means of a little bag filled with flour of sulphur. Encase about two tea spoonsful in a calico bag, and suspend it to the upper perch inside the cage. The bird in jumping from one perch to another, gets slightly dusted with the flour of sulphur. Tobacco dust is likely to be injurious. In the South, the method we have described, we have seen constantly in use.

NOLAN.—We know of no one in the United States who could post you on African sports. In the *Field*, however, is an advertisement, which might be of avail. Address Kathlamba; post office, Norwich, England.

ARDENT YOUNG'UN.—No remedy for rust when you shoot by the sea shore; remove stains every night. Benzine is the best thing for cleaning; a pint will last a month. Whilst the gun is not in use, lubricate with mercurial ointment.

GEORGIUS.—Lord Lurgan's celebrity as to dogs arises from the fact of his having bred the famous grey hound, Master McGrath, though he has a very good breed of setters. Mr. Raymond of Morristown, N. J., has the choicest breed of red Irish setters in the country, at least such is our opinion.

TEXT, Baltimore.—The Clumber is a silent dog while ranging. See this week's article. Do not know of any in this country. Is the largest of field spaniels, and does not take the water. Think he would be useless for ducks. The true breed of field spaniels are cocker, springer and clumber. The latter dog will weigh forty pounds.

L. S. Philadelphia.—Clean brass and steel cartridges, as you would the gun. We like nickel silver cartridges, but they are a trifle heavy; they never split, which is an immense advantage. Have fired them with seven drachm charges and two ounces of explosive bullets without damage to them.

ROSE BUD.—Ground quassia wood is excellent for rose bushes, currants, etc. Take about five pounds, sew it in a coarse bag, put this in a barrel of cold water, let it steep a few days, then syringe the foliage early in the season, every four days thoroughly for about a month. It improves the foliage, and keeps all insects away.

JOHN.—Persian insect powder is a very useful article. No sportsman should go off on a tramp without it. If you have any fear of insects being in the sleeping car, or beds, use it liberally between the sheets and bedding. We have proved it thoroughly both North and South. It will keep fleas from dogs, or drive roaches and ants away from closets. It appears stifling to insects of all kinds, but is not poisonous to animals. It must be fresh, and kept from the air to retain its strength, and be of service. Always carry it in bottles.

J. B. L. Fort Smith.—All well authenticated snake stories, we should be glad to publish, when the characteristics of the snake, and the methods employed to cure the bites, are stated. So far we believe only in stimulating thoroughly the person who is bitten, and in the application of a tight ligature between the wounded part and the body. Free use of the knife, and burning powder in the wound are, however, useful. The injection of ammonia into the system, as an antidote, we are not certain about.

ROWELL, Fond du Lac, Wis.—Your dog has already got too much spaniel in him; he is getting too old now. You ought to have taught him when seven or eight months old. You must have patience and teach him to drop to the gun and hand; he may be taught by means of a pistol to "Down Charge." Never let him retrieve his game on his own account, but always tell him, "Now Fetch, Fetch." If the dog is as good as you say, you might wait until he gets older, and then cross him with a pointer, so as to bring back the original instinct, or if there are no pointers, get a good breed of setters.

T. J. & M. W. H.—For answers see "Sea and River Fishing" department in this and previous numbers of this paper. It is of little use for our friends to ask us for information by letters. We are too busy. We shall endeavor to keep them thoroughly posted on the conditions from week to week.

CAPTAIN G.—No attempts have been made to introduce the Capperlize in the United States. They might live in Upper Oregon. We think Col Skinner wrote an excellent article on this subject. Best authority, L. Lloyd's game birds of Sweden and Norway.

ALFRED.—You can buy explosive balls of Simons, Granville street, Halifax. If he has not got them on hand, will make them for you. Worth one dollar, gold, a dozen.

HENRY.—Would only be too glad to try a good article of American caps. Our primers for cartridges are quite as good as the English ones. Sorry not to be able to say as much of the caps.

SEPTEMBER.—Cayenne pepper in the shoes between the sock and the leather, will keep the feet warm. Just dust from a castor.

DAVIDSON.—Best time for Buffalo, close of October, Colt's revolver may serve as good as anything else.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, SEPT. 11, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

This paper sent gratuitously to all contributors.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Managing Editor.

Calendar of Events for the Current Week.

FRIDAY Sept. 12.—Plainville Park Association, Conn.—Westchester County Association, White Plains, N. Y.—Wellsboro Driving Park, Penn.—Saratoga Rowing Association, Saratoga Lake, N. Y.

Saturday, Sept. 13th.—Boat clubs foot of 133rd St. East River.—Athletic Rowing club race.—Oneida Regatta, Jersey City.—Plainville Park Association, Conn.—Society of Horticulture and Agriculture, White Plains, N. Y.—Prospect Park meeting, Brooklyn, N. Y.—Wellsboro Driving Park, Penn.—Hamilton, Regatta D. of Canada.

TUESDAY, Sept. 16th.—Central Pennsylvania Association, Altoona, Penn.—Kansas City Association, Mo.—Union Driving Park, Peoria, Ill.—Fleetwood Association.

WEDNESDAY, Sept. 17th.—Atlantic Boat Club regatta, Hoboken.—Kansas City Fair, Mo.—Central Pennsylvania Society Altoona, Penn.—Union Driving Park, Peoria, Ill.—Regatta St. John, New Brunswick.

THURSDAY, Sept. 18th.—Fleetwood Association, Morrisania, N. Y.—Kansas City Fair, Mo.—Union Driving Park, Peoria, Ill.—Central Pennsylvania Association, Altoona, Penn.

THE GREATEST PARK IN THE WORLD.

THANKS to Mr. Hayden, we are now commencing to appreciate the grandeur of the Government reservation on the Yellowstone river. In time to come, when our great-grand-children people the Pacific slope, and population teems there, the memory of that particular Congress who made this great natural wonder public property, will be gratefully remembered. To the grandest scenes of nature, overhanging cliffs, deep gorges, towering mountain heights, are added the glorious falls of the Yellowstone. At the head of the grand canon, the fall is found to be 397 feet in height, and the depth of the canon at its foot is 675 feet, increasing rapidly to 1,000 feet. Here the river narrows, and takes a deep sea-green color. A half mile from the upper fall there is another fall of 140 feet. These may be natural beauties, but in this park the supernatural is added. Think of the geysers, with a temperature of 104° to 108°, at an elevation of 6,779 feet above the sea! clear boiling fountains of water, bubbling all the day, forming beautiful incrustations on their margins. Never ceasing are they. To-day a spring may be here, to-morrow it may be gone, but then a new one has taken its place, bursting out at a short distance from its old locality. The very mud these hot 'spring cast forth loses the character of simple mud, but is changed in hue, and is now red, now black, now cream-colored.

We cannot but express our delight over the fact that this reservation belongs to the great American people for all time to come, and we consider it the first grand national step in the direction of the preservation of our forests.

THE SCOTCH GAMES.

IF the FOREST AND STREAM may find some fault for that a lack of interest our own native Americans take in athletic sports, such complaints can hardly be addressed to those of foreign birth, who divide with us the "possession" of this good country of ours. If we cannot yet look to our own people for the better furthering of that manly spirit which delights in out-of-door sports, we certainly can, with no small pride, point to the Scottish games, now so firmly established in our midst, and may hope that in them will be found that leaven which must, in time, work through all our more sluggish native element.

Outside of Scotland, beyond the Duke of Athol's Glen Tilt, we think it no exaggeration to state, that nowhere else in the world, not even in London, could there be found congregated such a large assemblage of people as witnessed the Scottish games at Jones' Woods on the 4th of September instant.

Among the oldest of human traditions, is that of nomadic tribes assembling together at stated periods to witness the strife of their athletic heroes, and there is something impressive when one sees our adopted citizens in this fresher country of ours, reproducing the games which have been played in old Scotland so many centuries ago.

These Scottish games, intensely national in character, consist principally of tossing the caber, putting the stane (stone), and throwing the hammer, and vaulting. A caber may be a trunk of a tree, twenty-five feet long, if you please, and must be turned over completely in the air before it falls to the ground, by a combination of sheer strength and dexterity. There is no limit to the size of the caber. If one is beyond a man's strength, he takes a smaller-sized one. It is something like the struggle between Milo and the oak.

Putting the stone, is to take a cannon ball, weighing from twenty to fifty-six pounds, and to heave it. The ball is usually held in the right hand, and the athlete, resting himself on the right foot for an instant, with the weight well behind him, suddenly lurches forward, and as soon as the left foot touches the ground, away goes the heavy ball. Mr. Dinnie, the famous Scotch athlete, has been known to have thrown the twenty five pound ball forty-seven feet ten inches.

Throwing the hammer, perhaps, exhibits the highest degree of skill. The hammer is usually a ball of iron, weighing some sixteen pounds, into which an ash handle is inserted. Planting his two feet in the ground, sometimes with his back to the point de mire, he swings the missile two or three times round his head, when, wheeling suddenly around, away hurtles the hammer like a sky-rocket. The greatest of the hammer throwers has been able to launch it a distance of 140 feet.

See all these gallant feats accomplished by men clad in the handsomest of costumes, while the pibroch chaunts, and it is the true conception of what athletic sports should be—a strife of demigods.

This year's sports were remarkable in every respect, not only for the excellence of the contests, but for the admirable arrangements made for the 20,000 sight-seers; and we cannot but congratulate our Scotch citizens on the conclusion of the finest athletic festival we have seen for some years.

WOORARI, OR CURARE.

THIS deadly poison, quite as fatal to living creatures as crotiline, known under the name of woorari, or curare, was first brought to England by Sir Walter Raleigh. Its effects upon animals have been thoroughly studied by the distinguished physiologist, Claude Bernard. How it is made, or from whence derived has, however, never been absolutely determined. From *Le Tour du Monde*, we translate the following, taken from Doctor Saffray's travels in New Granada. "The favorite arm of the Choco Indian at San Juan is the *bodoquera*. What they use in this blow-gun are arrows poisoned with a substance similar to curare which they obtain from the venom of a frog. The batrachians which furnish the poison, is only found in certain districts. The proper name for it, is *Phylllobates melanorrhinus*. It is a frog three inches long, of a yellow color, with red spots on the back. Its eyes are prominent and it has a black nose. When these frogs are scarce, another variety with a black belly answers the purpose. They keep them for use in small wicker baskets. When poison is wanted for their weapons, they take the unfortunate creature, and tie it to a green branch and expose it to a slow fire. Almost immediately from all over the body of the frog there exudes a whitish substance, and after that a viscous yellow oil. This the Indians scrape off carefully, as it is the true poison. A frog may have this cruel process repeated several times, and on each occasion will furnish a certain quantity of poison. Like curare, this frog venom seems to effect all the organs of locomotion, and animals absorbing this poison into their tissues, die of asphyxia.

Desirous of satisfying myself on every point in regard to the action of this poison, I induced an Indian to use it in my presence. Equipped with his *bodoquera* or blow gun and a machette, we took to the woods. I should have liked him to try his arrow on a jaguar, but none appeared. Presently, however, a small specimen of deer came within shot. The Indian carefully raised his cane tube to his mouth, his chest became expanded, as with quite an effort of his cheeks he discharged his arrow. The deer was struck with the minute arrow, and at a single bound was

in the forest, the Indian following. Ten minutes afterwards the animal lay at my feet, breathing it is true, but perfectly unable to move. When a small animal the size of the deer is struck in any part of the body, where the circulation is rapid, its powers of running are limited to not more than three minutes. The limbs stiffen, the animal stops, trembles, and falls. All the voluntary muscles cease their action, absolute paralysis sets in, and the heart ceases to beat."

HOME AGAIN!

TWENTY-FIVE hundred trunks consigned to one Express Company in a single day!

This is the number of pieces that, we are told, were brought to New York by the returning sojourners in mountain, seaside and fashionable watering place, the moment the first chilly zephyr from the northwest ushered in the autumn. And if so many trunks to one Company, how many to all the rest together?

"Homeward the swallows fly," says the German poet. Even so do our fair ladies hie to their long deserted homes, and all in a body, too, just like the little birds. What a flutter and fluster they make as they swoop down and settle among us! But why is this thus? Why do they all take wing at the same time? Why does one thought and one mind seem to animate the whole? Oh! it is "the fashion," we suppose! Is it the fashion then with the little birds? *Quien Sabe?*

But the blessed little birds never bring any trunks. Much as we delight to compare our returning dear ones with the swifter winged travelers, this mountain of trunks completely destroys the metaphor. The poetical allusion, or illusion, vanishes.

Poor Dodd! careworn Dodd! Are you married? If so, do you, O Dodd, restrict the ladies of your family to a definite arbitrary minimum of trunks when they travel? Just suppose for an instant, that the gentler sex should become imbued with the Grange spirit and endeavor to dictate to the railroad and express companies regulations governing the transportation of their baggage! Combined with the farmers, what corporation could withstand their united pressure?

Yet, welcome the returning trunks! They bring good cheer. Now gleams the light of the roseate smiles around the domestic hearth and festal board. Welcome the trunks! The croquet lawns will be gay with parti-colored costumes, the bridge paths of the Parks be enlivened by the fair equestrians; the theatres sparkle with vivacity, and all the familiar salons and fashionable resorts, long empty, once more be thronged by the devotees of pleasure. Welcome the trunks! Their coming means that the enervating heats of summer are ended; that the cooler autumn invites our lady readers to the fields and groves, where we trust the FOREST AND STREAM will be able to teach many a pleasant lesson to those who enjoy our out door recreation.

THE GRAPHIC BALLOON.

WHILE our paper is on the press, the great balloon is advertised to be en route for Europe. For several days at the Capitoline grounds in Brooklyn it attracted thousands of curious spectators. As it lay on the ground, half inflated, and swaying at its moorings, it rose high in air above the enclosure, seeming like a living monster, rising and falling on the atmospheric wave with pulsations so regular that twelve beats of the watch marked the intervals. It requires 400,000 cubic feet of gas to fill the balloon, and the inflation, through an eight inch pipe, occupies three hours. A canvas tent held all the appliances of the expedition—the lifeboat Chicago; the miniature canoe, the paper boat Donaldson; the carrier pigeons, the balloon car proper, the astronomical and meteorological instruments, the life-preservers, the water kegs that will serve as ballast, the anchors, sails, ropes, hatchets, saws, buckets, and the details of the aerial household.

Underneath the balloon will hang a rope car, distended by three rings. From the upper ring will hang cords holding the car; the ropes suspending the paper boat, and ropes suspending the lifeboat. The car, which is a lattice of ropes, has a floor about twelve feet below the balloon, on which are chairs, a table, the mercurial and aneroid, barometers, sextants, and thermometers. In the paper boat, modeled after the Staten Island canoe club-boats, are a compass, sails, and a paddle. The lifeboat is one of Ingersoll's best, with sleeping room below the deck for three, watertight compartments, binnacle, compass, cooking furnace, oars, anchors, &c.

Every evening during the week fire balloons were sent up as tests of the upper currents, and so far, at an estimated height of two miles, they have sailed off to the eastward. Upon the continuance of this eastern current the success of the expedition, and perhaps the lives of the aeronauts, depends. It becomes a serious matter now, this sailing away in space at the mercy of the winds that blow, with no secondary controlling or counteracting force whatever. It is much like launching an ingeniously contrived craft above the Falls of Niagara and trusting to fortuitous improbabilities for successful preservation after the fearful leap is made; and yet the feat might be done. At best these experiments are a trifling with God-given life, and we feel that it would be better to start the big thing off on its mission alone than to sacrifice these intrepid but foolish aeronauts to misapplied science by sending them off with it. It may be Wise to go, but we think he is wisest who stays at home. Yet if it must be, we can only join in wishing the attempt the fullest success.

THE ADIRONDACK PARK.

IT may probably devolve on the next Legislature to decide the question whether the Adirondacks will become a portion of the public domain. While we have been so lavish in granting whole sections of country—giving away at a single stroke of the pen as much land as the area of England—to railroad companies, it might be wise to recall the old adage "that charity begins at home." The Commission recommend the occupation of about 850,000 acres, or 13,350 square miles, situated upon the Hudson river side of the mountain divide which separates the head waters of that river from the streams flowing to the St. Lawrence. The Commission state that "this would be the approximate area which would be required for the purposes of a forest park, in case it should be determined that the preservation of the forests covering and protecting the sources of the Hudson is all that is necessary for that purpose." Of these lands the State already owns nearly 40,000 acres, pertaining to the general and school funds. Most cogent are the arguments of the Commission. The principal and strongest is, that it is the water reservoir of the Hudson river, and that it influences the whole general climatology of the State. Not only do questions of navigation enter into the subject, but in a sanitary point of view such a reservation would be a perpetual retreat for those who dwell in the cities. In the United States such is the energy of the settler, who only necessarily looks to his own interest, that forests are cut down almost, as it were, in a single day, and without some State interposition it is absolutely certain that in less than ten years three-quarters of all this section will be perfectly denuded of trees.

Legislatures are slowly but surely commencing to understand these matters, and our hope is, that the whole subject will be placed before them in a practical way. We do not urge here the tourist or hunting question. As much as the FOREST AND STREAM advocates the preservation of game, we would give it a secondary place, though the preservation of the woods is the life of the game. Cut down these Adirondack woods and the lakes will dwindle into ponds, and the rivers into brooks, and then, when the ground is parched, when the rain does fall, will come those freshets which will sweep away all man's works on the borders of the streams. Then, exactly those capricious changes most detrimental to man's interests will be found. To-day the noble rivers will run dry; to-morrow a huge avalanche of water will tear down the channels. The right way for the Commissioners to place it before our Legislature is to have them look at the preservation of the Adirondacks as a question of self-interest.

OLD SHOTS.

SPORTSMEN of to-day, with their delicate sights, and the utmost nicety in the bore of their guns, are entirely ignorant of how well their ancestors used the fowling piece and rifle. Two centuries and more ago it must have not only required great accuracy of aim on the part of the sportsman, but, what is more difficult to explain, a continuance of aim. With guns and rifles of the seventeenth century, a certain interval of time, and quite an appreciable one, must have elapsed before the match or flint which brought the fire to the pan could communicate with the charge in the chamber of the piece. It is not impossible to suppose that the old marksman never knew precisely to a second when his piece would be discharged, and was forced to follow for a certain time with the muzzle of his piece the movement of the bird or animal. We hear of Josseleyn, in his voyage to New England in 1644, telling how a certain Mr. Hilton shot at the *Pilhaunan* which he styles as "the king of birds of prey in New England," and how "Mr. Hilton, having made ready his piece, shot and brought her down to the earth as she was soaring aloft in the air." Now here we have a sportsman of the time of Charles the First who must have shot a bird flying with a single ball; for from the size of the bird described, as frightening all the ducks and birds in the neighborhood, it was very probably an eagle. We have evidences, too, that the Moors were quite good shots, for in 1637 one Alkaid Abdallah, ambassador from Morocco to England, is quoted in the old chronicles "as being so good a marksman with his piece that he will shoot *eight score* at a mark as big as an English sixpence and hit it with a round bullet."

Good marksmen of to-day will allow that to hit a mark of this size at 160 feet is quite good practice. In the "Good News from New England" of 1621 there is an account of some of the early English settlers going to Packanock, where lived the great Indian chief Massassoye, and how this good savage gave the Pilgrim fathers a kind of bread called *matizian*, and the spawn of shad, and in return for his hospitality Massassoye begged them to kill some of the crows which damaged his corn. "When one of our men," says the account, "shooting one some fourscore yards off (eighty yards) and killing, they (the Indians) much admired it, as they did our shots on other occasions." The same authority goes on to state that wanting a duck or a goose to make some *pottage* therewith, "I took a man with me and made a shot at a couple of ducks some six score off and killed one, at which the chief wondered."

The "*Canadian Gentleman's Newspaper and Spirit of the Times*" is published at Toronto, and gives a valuable weekly resume of sporting intelligence throughout the Dominion of Canada. To gentlemen who are interested in Canadian turf matters this paper must be of essential service, as it is we believe, the only paper of the kind published in the Dominion.

INEFFICIENT PROTECTION OF RIVERS.

Professor Curtis, of New Haven, in another column, complains of the negligence or inefficiency of wardens upon the interior rivers of New Brunswick, and makes the statement, without qualification, that some of those persons who are appointed to guard and protect the rivers, actually wink at or countenance the destruction of salmon by netting and spearing to that extent that rod-fishing in the upper waters amounts almost to a nihility. His statements, we regret to say, are borne out by letters which we have already published in this journal, as respects other rivers in Canada and Nova Scotia, over all of which overseers are appointed and paid to protect them from this most baneful description of poaching.

Certainly, the beneficial results that have followed in the remarkable increase of salmon in rivers that have been efficiently protected, ought to stimulate the vigilance of the higher functionaries of the Canadian Government, and induce them to apply the penalty provided by law in all cases of dereliction, of which they must, assuredly, be cognizant. That there may be no plea of ignorance of these violations offered, by way of excuse, we shall forward copies of the FOREST AND STREAM, containing these letters, direct to the Hon. Peter Mitchell, the Minister of Marine and Fisheries at Ottawa.

It is unjust and dishonorable to take the money of gentlemen, who pay liberally for their leases, as in the case of the Miramichi, while they secure nothing but emptiness in return for the time, trouble, and outlay of their vacation journeys. We shall no more assist the flourish of Canadian trumpets, until these abuses be corrected. Hitherto our words have been only those of praise and admiration for Canadian energy and efficiency.

NOVA SCOTIA.—Desolate Nova Scotia! She really seems literally and practically to be doomed. Blowing up of her mines in the spring; fearful forest fires later on, and now the hurricane catastrophe, which has been almost unparalleled in the history of storms, over such a comparatively small area. Cape Breton's sea-board is lined with wrecks, and dead mariners on the sand tell the ghastly tale. The small towns and villages on both sides of the Bay of Fundy have suffered distressingly, and what the people are to do for food, &c., this coming winter, and in such a climate, is beyond comprehension. We who have hunted and fished in Nova Scotia, who have enjoyed its hospitality, have learned to appreciate the good-heartedness of its inhabitants. Is there no way of showing, in a practical manner, this feeling other than by words?

"ADIRONDACK LIFE:" A LECTURE.—We could hardly imagine a more interesting topic, when properly handled, than pleasing lectures drawn from forest and stream. Subjects of this character, have been mostly given to the public in book form; we therefore welcome the more popular method of lecturing, believing that it will further the appreciation of out-of-door-life. The Rev. W. C. Winslow, of Boston, a thorough sportsman and pleasant writer, who is familiar with all the haunts of the "wilderness," will deliver a lecture on the Adirondacks this winter. Lecturing committees would doubtless find here a topic of great interest and novelty, and likely to be appreciated by their audiences.

LOST CARRIER PIGEONS.—As the breeding and training of carrier pigeons is on the increase, and from stormy weather accidents frequently occur to the birds whilst flying with messages, we should be very glad to advertise in our paper, *free of cost*, the announcement of any carrier pigeons that have come into the possession of our readers who may be desirous of returning them to their owners. This method of gratuitous advertising is common in France, Belgium, and England, and it would give us pleasure if we were the means of restoring any lost birds to their owners. Any parties having strange birds will carefully describe marks, &c.

As the winter terms of our colleges and universities are to commence this month, we would be thankful if the officers of their athletic and boat clubs would report to us their plans for the future. It would please us to promote in any way within our power the development of gymnastic exercises and out-door recreation in our colleges throughout the country. As a member of the class of '54 at Yale, and afterward at Amherst, we naturally have the interests of collegians at heart, and feel that we have some claim upon their consideration.

—A committee of citizens have undertaken to improve the appearance of Washington's headquarters at Newburgh, N. Y., now in a dilapidated condition. The expenses will be defrayed by private subscription. The War Department at Washington promises co-operation. Secretary Belknap has ordered thirty cannon, ten Spanish, ten Mexican, and ten pieces taken from the confederates, to be sent there to be placed on the headquarters grounds.

—An economical Iowan, who had the tooth-ache, determined to remove his tooth in the Indian fashion. Accordingly he bent down a sapling in the woods, lay down himself and attached a stout cord to his tooth and to the sapling. Then he touched the spring, and the next he knew he had jumped over a grove of about forty small trees and was trying to get out of a small pond that he happened to light in.

FISHERIES' PROTECTION IN CANADA.

SINCE the inauguration of Confederation, the Dominion Government has given a great deal of attention to sea and inland Fisheries, particularly to the latter, which previous to Confederation, were rapidly declining, owing to the wanton destruction of fish by persons who, for the sake of present gain, selfishly carried on a warfare which seriously affected the interests of future generations. Under the efficient management of the Fisheries department, presided over by the Hon. Peter Mitchell, the Fisheries have been vigorously protected, and under the fostering care of the law are yearly becoming more and more valuable. For this alone the Government of Canada deserves well at the hands of the people.

In order to make the fisheries still more valuable, the artificial propagation of fish has been resorted to, which has been so successfully carried on in France and England for years past. The example set by Canadians has awakened enterprising Americans to the great importance of the subject, and in this country also the artificial method is being carried on under the fostering care of the Government. We copy from the "*Union Advocate*," of Newcastle, Miramichi, the following resume of Government operations in Canada, and respectfully suggest that the Government proceed without delay to extend its long contemplated supervision to the rivers of Nova Scotia, before they are totally depleted. We do not need any testimony to corroborate our own experience of the needs of the case, which are woefully pictured by a prominent gentleman of this city who spent five weeks in Nova Scotia this season. He says: "I am satisfied that the netting and spearing which is carried on by the Indians and others with impunity will utterly destroy the little fishing afforded by Gold river and other streams. A few years' care and protection extended over that section of Nova Scotia, and in fact throughout the Province, would be rewarded a thousand fold. With such attractions, in addition to the bracing climate and the really beautiful scenery, this coast might well command the patronage of summer tourists."

Previous to confederation, S. Wilmot, Esq., of Newcastle, Ontario, carried on the artificial process as an amateur, but when the Provinces became united, the Minister of Marine and Fisheries secured the services of this gentleman, who had met with considerable success in his previous efforts. Under his direction, the artificial propagation of fish has become quite a success in Ontario, and we are pleased to know that the North is now to have the benefit of his valuable services, which in the past have been recognized most substantially by societies formed for the promotion of Pisciculture in both England and France.

Mr. Wilmot arrived here recently. The object of his visit is to select some eligible site for the erection of a salmon breeding establishment. The principal object of introducing this new industrial work in this section of the Dominion is, that the Miramichi river, once so famous for its great product of salmon, may by this artificial method of propagation be, if we may so term it, largely subsidized in its production. By so doing, the Minister of Marine and Fisheries has again shown his usual sagacity in advancing the general interests of the Fisheries Department, not only in introducing this important work on the Miramichi river, but also in other parts of the Dominion as well.

The gentlemen referred to, after taking some time to thoroughly inspect the various brooks emptying into the Southwest and Northwest branches of our river, has at last selected one about five miles distant from Newcastle, on the last named branch, just above the bridge on Stewart's mill stream. This sight is represented by Mr. Wilmot as being a very eligible one, and well adapted for all purposes of an extensive fish breeding establishment. The large and constant flow of water in the stream, with sufficient fall for the easy erection of dams—the fine cove at its outlet—the proximity to our town—and its truly picturesque appearance, make it a charming spot, not only for the practical carrying on of the work, but also a very attractive one for the lover of nature and the study of the naturalist.

The above location, including the whole lot, has been purchased at a very reasonable figure. Mr. Wilmot has let the contract for erecting the dams, and is on the eve of closing the contract for constructing the breeding house. This will be a building of considerable magnitude, and is intended to have somewhat of a commanding appearance, its size being about 67 x 27 feet. The lower story will be used wholly for artificial breeding purposes, whilst the upper flat will be fitted up for a comfortable dwelling for the person in charge. Though the season for its completion is very limited, Mr. Wilmot's great anxiety is to get it so far advanced as to be enabled to lay down a large number of salmon ova this autumn, in order that its beneficial effect may be felt here as speedily as possible. When we consider the location, and the method to be adopted in distributing the young fry after being hatched out, the site must commend itself to every intelligent inhabitant; for it is intended that the fruits of this establishment shall be distributed equally in all the various tributaries of our river that can be approached. The *modus operandi* will be as follows: The parent fish will be procured at the most convenient points on the river, just previous to spawning, and placed in the dam. So soon as they become matured for manipulation the ova will be taken, duly impregnated, and then placed in the breeding boxes; and when hatched out in the month of April or May, will be carried in barrels or cans of water in boats or scows, and towed up to the rapid parts of the various tributaries forming the Miramichi river. The system pursued in Newcastle, Ontario, is to carry the young fry hundreds of miles by railway, and it has been done most successfully, the losses in transportation being very trifling indeed. How much more easily and safely, then, can the system of distributing young salmon be practiced here, where water conveyance will be resorted to, and where fresh supplies of pure water can be given to the young fish on their journey, which requisite is found almost impossible to procure whilst journeying upon the railway cars. We therefore look forward to a successful result, for the interests of all concerned in the advance-

ment of the great sources of wealth which the Miramichi river was intended by Providence to give man.

Operations are also being carried on up the Restigouche river, and also at Gaspé. At the former place an establishment is now nearly completed, and will be in full working order this fall. By referring to the Marine and Fisheries Report we find that the establishment is situated on a beautiful mountain stream called "Robertson's brook," which enters the Restigouche on its left bank, and about nine miles above the mouth of the Matapédia. It is a pretty, limpid pure stream, and is reputed to be never failing in its supply of water. The breeding house is overlooked by Mr. Mowat, a very energetic and efficient officer. At Gaspé difficulties have arisen in procuring as eligible a stream as might be desired. But the difficulty Mr. Wilnot thinks will be overcome, and he intends to start for that point at once, to finally locate and build an establishment there also.

News from Abroad.

STILL the bad reports about the birds in England continue. Save in Wales, where grouse, though not plenty, are stated to be sound, the complaints are universal. The suggestion advanced by us in our last *resume* of foreign sporting matters seems to have been actually carried out. The Duke of Buccleuch, from the moors of Upper Nithsdale, orders that not another feather shall be disturbed, and a very just mandate it is, and likely to be followed by many other true sportsmen. Think of the humiliation! The Lord of the Manor, who was wont to distribute yearly to his numerous London friends his two or three hundreds of juicy, toothsome grouse, is now forced to buy his birds at 8 shillings a pair, in order to feed his famished guests at his own table. This dearth of game has its effect, too, on the English larder. At Leadenhall Market, on the 12th of last month, grouse were scarce at 22 shillings a brace, and even at the close of the month were selling at exorbitant prices. Of course, the whole matter of grouse will be, before long, worked up in true ponderous British form, and an encyclopedia on grouse will be forthcoming. Then will it be found out that it was not the *entozoon* in *evenum* (worms) which made grouse so scarce, but the general and indiscriminate slaughter of prior years. The arms have surpassed the birds. Grouse driving, battues in general, use of sham hawks to keep birds down to the ground, and kid glove and *eau de cologne* shooting generally, will be derided in true, straightforward English of the bluntest and tersest character. If our English friends cannot shoot at home, they are seeking other fields of sport. To-day exactly is the opening of the Baden Grand International Pigeon Shooting-match. It is under the august patronage of an English Duke and some two foreign Princes. Though a Duke of Hamilton and a Prince of Rohan may combine, and to the aristocratic *echel* of the thing add the more material effect of a 5,000 franc prize, we think the time is not far distant, when all pigeon matches will be considered as the relics of a barbarous age.

As nothing can be satisfactorily arranged in England without copious feasting, our English friends had a most pleasant anniversary dinner to commemorate the foundation of the Brighton Aquarium Company, now one year old. It was unfortunate that Mr. Buckland was not present, but Mr. Octopus Lee did the honors, and doubtless Mr. Sala was as funny as the circumstances could allow. An American gentleman present, in answering a toast given to the health of visitors, spoke feelingly of the merits of the *Tortog* (so Mr. Buckland writes it), and Mr. Buckland asks, "Who can tell what a *Tortog* is?" *Tautoga Ameriana* is the proper name, O most distinguished English Ichthyologist! a real Roman fish, as his name denotes, as far as the toga goes; a very good fish to catch and to eat. But whilst talking of eating, has France so fully developed hippophagy, that Lutecia cannot now do without, as a luxury, what once she was forced to gnaw when starving? In 1872, Parisians ate 9,725 horses, 866 asses, and 51 mules, the total quantity of horse-flesh devoured being 2,408,076 pounds. We wonder if a Mustang would not have a superior gamey flavor? Suppose Delmonico should give us a *Macedoine de Mustang* of General Custer's killing?

But to return to England. All the great London cricket matches are ended, though Surrey and Sussex, Kent and Dorset, Royal artillery and engineers, horse, foot, and dragoons, are wielding bats and toppling over the stumps throughout rural England. But move aside, all ye gallant gentlemen athletes, and give place to the brave ladies of England, Scotland, and Ireland. There has been a grand archery meet of ladies, at Dublin. Number of arrows, four dozen at sixty yards, and two dozen at fifty yards. Sir A. Guinness gave the silver cup. Then they have been shooting, too, at Newby, at Hove, and Porvis Castle, and at Birkenhead, and in several matches where gentlemen and ladies contested for the prizes, mostly the gentler sex have won. If the FOREST AND STREAM has a mission, it is to reproduce this beautiful sport in the United States. Perhaps it is too late for this season, but next year we hope to hear from many a grassy lawn, the twang of the bow-string and the hurtling of the arrow. Toxophilic sport must be *a la mode*.

—A correspondent of the *Cincinnati Citizen* gives the following description of the fish jewelry which Denmark contributes to the Vienna Exposition:

"This jewelry is made exclusively of the bones and scales of fish. It is just as dear as if it was made of gold, and it is highly esteemed by the ladies of Copenhagen. It is in many respects the most beautiful class of fine work we have seen. There are earrings, bracelets and crosses, made of fine delicate fish bones, white as the driven snow, and carved fine as gossamer web, and embossed

with beautiful bright red and crimson fishes' scales. There are also large cases of fish jewelry, such as knives, forks, spoons, ladles, etc., carved in the most exquisite patterns out of fishes' bones and ornamented with fishes' scales."

—As shooting tigers is now among the fine arts, the best authorities state that baiting him with a calf or a goat is all nonsense. He will no more come to it, than an elephant after a single blackberry. What he wants is a whole bullock to tempt him. Then shooting him from a hole is declared to be risky, as he can jump down into the hole after you. The only way to bag him, is to shoot from a platform, in case you can tell him on, because he cannot climb after you, and about fifteen feet is the limit of his spring. His familiar name among India officers is "old stripes."

—The French war indemnity was 5,000,000,000 of francs; interest on same for two years, 800,000,000; keep of German troops, 273,637,000; requisitions, 327,581,000; value of objects taken without requisition, 254,172,000 francs; war contribution levied on Paris, 200,000,000, making, in all, the neat total of 6,673,811,009 francs. As the average value of a day's labor in France is not more than thirty-six cents, it is not difficult to count how many days' labor it would take to pay this enormous sum.

The Horse and the Course.

VETERINARY SCIENCE IN FORMER TIMES.

From a Blue-book lately published by the English Patent Office, containing accounts of all ancient inventions, relating to farriery and veterinary matters, we make some brief extracts:—

"No great antiquity can be boasted for the science of veterinary medicine. Ancient nations seem to have paid little or no attention to the medical treatment of their domestic animals. Valuable as the horse was, they necessarily expended great care upon the preservation of his health, but we cannot discover that they used any remedies to cure an animal once diseased. The well-known work of Xenophon (*ippiche* Treatise on Horses) contains many precepts that might with advantage be studied by horse owners of our own time, but he gives no directions for the care or treatment of the horse during sickness. Hippocrates wrote a treatise on equine disorders, Columella (early part of first century) and Vegetius (end of fourth century) both wrote on the same subject.

"But more ancient records relating to the matter seem entirely wanting, and even the above, as might be expected, show extreme ignorance. In searching into the early history of any art, we are almost certain to find very ancient record of it among the Chinese. So it was with veterinary medicine. The late Professor Sewell, in one of his addresses to the Royal Veterinary College, said that he had been shown by Professor Huzard, in Paris, a Chinese work on the subject, with colored plates. The date of it was uncertain, but it was probably not less than 5,000 years old.

"During mediæval times the art was in an equally low state, and entirely abandoned to farriers. The practice of medicine as applied to human subjects was rough and barbarous enough, and that by which horses were treated was even more cruel. Many very barbarous operations were recommended in old French works. At length the assistance rendered by the dissection of animals to the progress of medicine in general, received most notice. Amongst the early veterinary inquirers of note were Ruelli, Solleysel, and Lafosse, whose works are mentioned in the list appended to this book; contemporary with the last-named was a Spanish author who wrote on glanders—a disease said to have been brought by Columbus from America. In England, Snape, Gibson and Bartlett (in or after the times of Charles II.), were the first names of note. But it was not until the middle of the eighteenth century that any great improvement was effected. France then took the lead. A farm near Lyons was converted into a school in 1761, and Bourgelat appointed professor. Three years after this, in 1764, a larger school was opened at Alfort, near Paris, and since then another at Toulouse. Other countries followed the example. In 1792 the London Veterinary College was established, chiefly through the exertions of an agricultural society at Odiham, in Hampshire.

"Going back to the most ancient known records of civilization, the monuments of Egypt and Assyria, we are unable to discover any indication of the use of a protection for the horse's foot. Considering the number of horses delineated in the Egyptian paintings and the Assyrian sculptures, and the minuteness of detail that especially characterizes the artists of these ancient monuments, it is impossible to suppose that any horse-shoe was in use without its being represented, not only occasionally, but frequently. No such representation has yet been found, and we may consequently conclude that horse-shoes were not known to those ancient nations.

"Similar researches amongst Greek and Roman antiquities go to show that horse-shoes proper were unknown to the classical peoples. Horse-sandals of various sorts were used as a temporary protection for the foot, but the plan of nailing a metal plate on the hoof appears not to have been used at all. Mr. Fleming is of opinion, and the arguments he brings forward seem nearly, if not quite, conclusive, that the inventors of horse-shoes are to be looked for amongst the Teutonic or Celtic nations of the north. The Gauls shod their horses, so did the ancient Britons, so did the Scandinavians. It even has been suggested that a principal part of the Druid's office was connected with smiths' and farriers' work.

"In mediæval times the position of the mareschal, or farrier, became a very important one. During the age of chivalry there was nothing degrading in noblemen shoeing their own horses, and the mareschal was held to be on a footing of equality with the chamberlain, falconer, and other household officers of a court. Horse-shoeing was then as universal as now. Pictures of knights and cavaliers always represent the horses as shod, and allusions to the practice of shoeing frequently occur in middle-age writers.

"Strangely enough, very little difference is discernible

between the most ancient shoes and the most modern. Of course some very old shoes are of the roughest workmanship, but as soon as the art of working in iron was brought to a state of comparative perfection, we see shoes exactly resembling those in present use. Numerous as have been the inventions for improved shoes, none of them have been found sufficiently successful to obtain general favor. Over and over again the same inventions have been brought out, tried, and cast aside, to reappear as new a few years later on, and we still use much the same shoes as those with which William the Conqueror's horses were shod at Hastings."

The Fashion stud farm stables at Trenton, New Jersey were burned last week with eleven horses out of the nineteen which it contained. Among the horses burned were two road mares belonging to General Grant; Lapier a valuable animal belonging to Mr. Butterworth of Philadelphia; a large bay horse owned by the same gentleman; a fine stallion belonging to Mr. Hutchinson; Henry B. belonging to William H. Dobie, valued at \$4,000, and five other horses. The following horses were saved: Goldsmith Maid, Lucy, Roslyn, Hotspur, and California mare.

The following horses were also burned: Lizzie Perry, owned by Edward Perry, and a black horse from Bethlehem Pa. Lapier was valued at \$10,000. The stallion belonging to William Hutchinson, valued at \$6,000.

NEW ENGLAND FAIR GROUNDS.—The races at the New England Fair Grounds, Boston, September 3, 4, and 5, were witnessed by 20,000 people, notwithstanding the rain interfered much with the programme. Some fair time was made, Climax and Dustin Jim being among the victors.

GOSHEN PARK ASSOCIATION—Sept. 3.—The second day's trotting attracted a large crowd. Purse, \$500 for running horses. Landlord's Purse, John Brougham's blk. g. Gerald won. Time, 1:48½, 1:49.

Second race. Purse \$1,000 for horses that never beat 2:40. Three horses started. W. E. Week's Goldie won the three last heats. Time 2:41, 2:41½, 2:44.

Third race. Purse \$1,000, for horses that had never beaten 2:33. Four horses started. A. Fleck's s. m. Lady Emma won. Time 2:33, 2:32, 2:35½.

September 4. Third day. Handicap hurdle race. Purse \$500; about one mile and a half over six hurdles. Five horses started, and was won by J. Boughram's s. g. Revenge. Time 3:44.

Trotting. Purse \$1,000, for horses that had never beaten 2:50. Mile heats; best three in five, in harness. Nineteen horses started, eighteen of which were distanced during the race. N. Jennings' b. g. George Miller won. Time 2:39½, 2:34, 2:30½.

FLEETWOOD PARK, September 5. Purse \$100 for horses that had never beaten 2:50; mile heats, best three in five, in harness. Ten entries. Five horses were distanced; C. Heinzell's b. g. Central Boy won in three straight heats. Time 2:48, 2:46, 2:54.

Sweepstakes \$400; mile heats; best three in five, in harness; catch weight. A. Bourett's b. m. Marie Louise won, 2:50, 2:50, 2:49.

DEERFOOT PARK, Brooklyn, L. I. September 8.—Match of \$200; mile heats; best three in five; between Roger's Honest Abe in harness, and William's Unexpected, to wagon. Honest Abe won. Second match for \$500; McMahon's George, to wagon, Thom's Slippery Dick in harness. George won. Time, 2:40; 2:42, 2:48.

—Colonel Russell, the owner of the stallion Fearnought, which died recently, has bought the celebrated horse Smugler, brought from Kansas, and which recently astonished the horse men at Prospect Park, Brooklyn, by trotting three consecutive heats in 2:19½, 2:19½, 2:21. The price is understood to be \$50,000.

—The recent fire at the Fashion Stud Farm, near Trenton, N. J., was very disastrous, and men have been employed in burning the remains of the burned horses. A man that Budd Doble had discharged a few days previous, is strongly suspected of having set fire to the stables. President Grant lost a number of filies, and set great value on them, as he had raised them himself, and would not have parted with them for any money. There were 135 horses, including stallions and brood mares, on the farm before the fire broke out. Fortunately, the most prominent and valuable of the lot were saved. The owner intends erecting a large and handsome stable on the old site.

THE PILLARS OF TATTERSALL'S.

ADMIRAL Rous and Sir Joseph Hawley are state pillars in this aristocratic republic. Their word upon a point of honor or upon a rule of the ring carries with it all the force of law to thousands who know them only as the great twin brothers of the turf. You can read nothing in the face of a thoroughbred man of the turf except perfect self-possession, shrewd intellect, and a will of iron; and you may pick these men out in the subscription room at a glance from the crowd who are purchasing their experience at the expense of their ancestral oaks, and perhaps of something more. Here is one of these neophytes of the ring—a companion of princes, the son of a Minister of Cabinet rank, with the blood of an Eastern Emperor in his veins. He is booking a bet of 100 to 1 to a youth with the down still on his cheeks, the son of one of the most illustrious of the Crimean heroes; and close by, in the centre of a group of bookmakers and aristocratic "legs," stands a young man—still, probably on the sunny side of thirty—who will tell you with the utmost nonchalance that he has sold an estate to a city man for £300,000, to square up his book and to fight the ring. He is the representative of a long line of mailed barons who fought under the walls of Jerusalem, at Cressy and at Agincourt—statesmen and warriors who in their time administered government and war with more than the capacity of Richelieu; and he is flattering himself with the presumptuous hope in these piping days of peace it is his destiny to add one more exploit to the achievements of his race by breaking the Ring.

—The following named gentlemen have been elected Directors of the Jerome Park Villa Site and Improvement Company for the ensuing year:

Francis Skiddy, Leonard W. Jerome, August Belmont, Lawrence R. Jerome, A. C. Monson, William Constable, and William H. Anthon. At a subsequent meeting of the Directors Francis Skiddy was elected President of the Board, William H. Anthon, Secretary, and A. C. Monson, Treasurer.

Sea and River Fishing.

GAME FISH IN SEASON IN SEPTEMBER.

Bluefish, (*Temnodon saltator*.) Striped Bass, (*Labrax lineatus*.)
Land-locked Salmon, (*salmo Gloveri*.) Black Bass, (*Centrarchus fasciatus*.)
Trout, (*Salmo fontinalis*.) Maskinonge.

We have most favorable reports of the black bass fishing in the upper Potomac river, of great catches of fish all along its course that run up to six pounds in weight sometimes, and all the result of the most judicious system of restocking depleted streams that was inaugurated only a few years ago. At Little Falls, eight miles above Washington City, fine sport has been enjoyed all through the season, and will continue until the ice begins to make. It in a beautiful drive up there from town; or one can jump aboard a steam tug that plies on the canal, and soon reach his destination. At Great Falls ten miles further from the head of the aqueduct that supplies Washington with water, the fishing is still better, and at Harper's Ferry, mouth of the Shenandoah better yet. The last named points are not quite as accessible as Little Falls, which accounts for the greater amount of fish. At each locality are sporting houses for guests, where bait is furnished and tackle, if desired. At Great Falls the bed of the river is much filled with great boulders, and the fishing is all done from the shore. At other places boats are anchored in the stream to enable the angler to get better casting room. Use small minnows for bait, a medium-sized hook, with rod and reel. It will pay our anglers to run down to Washington for three days. When they are tired of fishing, they can pass the time by loafing around the Capitol.

Of striped bass (sea fish) we have written at length in our two previous numbers. The fishing has been fair among the islands off Massachusetts and along the east end of Long Island, but we hear of no great catches such as we herewith append. It is the score of a single day's fishing at Pasque Island made by Jacob L. Dodge on July 17th, 1868. The figures given specify the individual weights:

40—37—33—32—27—24—22—20—20—18—17—15—15—15—14—14—14—13—13—11—11—10—8—8—total 451 pounds.

This must have been a hard day's work for Jacob, and would have astonished Peter as well as James, and John, "who also went a fishing." On the 17th of September, 1869, Mr. J. B. Dunlap caught at the same place a bass that weighed sixty-two pounds.

Here is a feather in the sea-side hat of Mrs. T. E. Triplet, whom may the propitious fates forever serve! She took a bass on the 23rd of August just past, 1873, at Pasque Island, that weighed thirty and one-half pounds. The powers this lady has displayed in bringing such noble game to hand should excite the emulation of all the fair sex who go down to the sea in ships, or in railway cars and steamboats.

As respects blue and bass fishing there seems to have been a *hiatus* for both fish and anglers lately. The fish ceased biting altogether for a time, and jolly yachtsmen rigged out their outriggers in vain. But within a few days past some boats have made a fair showing, and the advent of a large run of fish is confidently anticipated day by day. The market fishermen have on occasion taken good fares of bonita and king-fish. By the way the indefatigable Genio C. Scott took eighty-two king-fish outside of Rockaway beach a week ago, which was unusual luck. We met him on the morning of his success, he with his bait and his tackle, and we with our central fire shot gun, and promised to exchange *two* of our snipe for *one* of his king-fish when the day's sport was over; but as we went home early in the day, we lost the opportunity of clinching the bargain.

The most convenient place for Brooklynites to obtain boats for a day's fishing is at Canarsie; for New Yorkers at Jersey city. There is excellent bass and weak fishing at times on the Jersey Flats, and down at the Narrows, and out at Rockway Beach. Among the rocks in the vicinity of Hell Gate, East river, is a favorite resort for some anglers. Boats can be hired at the Club House, Jersey City, at and opposite Mott Haven, New York, at the Penny Bridge, Brooklyn, and at Canarsie landing, the terminus of the East New York Railway. There are over sixty boats and forty yachts constantly on hire at the last named locality. Rockaway Beach is eight miles from Canarsie, and can be reached by a steamboat three times a day—10 A. M. and 1 and 4 P. M. We know of no better place for fitting out or for temporary sojourn than Canarsie. The Bay View House there has a piazza that incloses it entirely on three stories. For striped bass, and, indeed, for nearly all kinds of sea fish worth catching, use a stout two jointed plain bamboo rod, a reel, and a stout line with a float, the whole costing some \$12. If the reader never attempted to cast for bass, let him take his friends out in a *decked* boat when he goes and when he is ready to cast send them all below; then he will catch his hook in nobody's ear but his own, and bang nobody's head but his with the leaden plummet he uses for a sinker, when he swings it around for an elegant effort. A novice, however, will bear some instruction in this practice. It beats throwing cogged dice "all hollow." Use shedder crabs or clams for bait.

One excursion which we wonder is seldom taken is by the 11 o'clock night boat for New Haven. You reach New Haven at daylight and have the day before you, returning the second night by boat which leaves New Haven at 11 o'clock. Thus the angler looses but one day from business and enjoys two nights of refreshing rest. At New Haven,

one has choice of localities and sports. The steam-boat landing is within a few rods of the East Haven marshes where snipe abound. On the hills wild pigeons abound in their season, and quails also. On the ridge that joins the East and West Rock, quail are found in considerable numbers, and on the West Haven side is a series of salt water flats that extend for several miles. These of course are much hunted. But it is of fishing we were speaking. Savin Rock or Light House Point are within an hour's drive by carriage, and both afford good fishing, while by the Shore Line Railroad a few minutes ride by the early train will place the angler at Branford, Double Beach, Stony Creek, Guilford, the Thimble Islands, and other places long known as tip-top fishing grounds for black fish, sea bass, weak fish, lobsters, &c., and now provided with hotels and boarding houses of all classes and every style of pretension. The charges are trifling, and the trip perhaps the most enjoyable and likely to be the most profitable of any immediately accessible to New Yorkers.

A letter from the Saranac Lakes, of September 1st, says that there are many people still in the "Wilderness," but they are not enjoying the same degree of sport as in days of yore. We quote literally: "Raquette river abounds in dead pickerel, and no trout can be taken at their usual places of resort."

A gentleman writes to us from Jordan river, Shelburne county, Nova Scotia, offering to sell us two live moose. By the way we have six of these animals now at our disposal, of both sexes and various ages. He says in his letter:

"Don't imagine the Nepigon is the only place where trout can be caught. I can leave home any day and return in the evening, spring or fall, and bring from thirty to forty pounds of trout, large ones, but not eight pound trout; about four pounds is the largest. September is our best month for sport. That is for trout and moose. Salmon fishing is good from the last of February, until the 1st of June. I have killed with the rod and fly in one day's fishing, morning and evening, twelve salmon from ten to thirty-one and one-half pounds. This Nova Scotia is a good Province for game, but we have but little time to indulge it."

D. H. Fitzhugh, of Bay City, Michigan, took two hundred grayling in Hersey river, of that State, last month. We hope to receive full particulars of this new game fish and his capture for publication in our next number.

Strange how the Chicago *Daily Tribune* should get up a French fish story. It talks of a carp 375 years old who was young in the reign of Francis first (circa 1515). Think too of his having been bought for 1700 francs in 1871, and to have been eaten up, not by a Prussian, but by a pike! Residence of the carp Chantilly. Mr. Frank Buckland has some trouble in swallowing this fish story; as for ourselves we are forced to reject it entirely.

WHAT BECOMES OF THE FISH.

TO THE EDITOR OF THE SPRINGFIELD UNION:

About three miles east of Springfield there has been for years a large rookery—or heronry perhaps it had better be called—where hundreds of night heron have congregated and reared their young annually. This bird is a wonderful fisherman; he fishes in the night and carries his own light on his breast; so he just wades into the pond or shallow stream, and, by the light of this strange torch, seizes his prey as they approach, attracted by its rays. They are great gourmandizers and require a large amount of food, as they bolt it whole. They are not given to economy, for they kill and carry away to their young vast numbers of fish too large for them to swallow, and large quantities are found at their rookery. Last year, while some parties were out to shoot specimens for our Taxidermist, Mr. Horsford, they found baskets of fish from the Wilbraham ponds and brooks,—trout, perch, pickerel, etc. There was formerly a large heronry just east of the one mentioned above, between the ponds in Wilbraham, but the swamp was cleared and the birds had to move their quarters. A large heronry was broken up in Agawam, a year or two since; also one below Hartford, near the Connecticut river. Since I commenced this article I have learned that a large heronry has been discovered in Ludlow the present season. I believe the one east of this city has been broken up this spring. I have indicated some of the habits of the night heron, let me give them more in detail: They are nocturnal, never moving in the day time, and hence the difficulty of finding them; they are gregarious; living and breeding in large communities; they seek the most secluded and inaccessible swamps in the neighborhood of ponds and shallow streams; they live almost exclusively on fish, but sometimes gobble up young chickens, and young birds fall a prey to their capacity. Prof. Horsford informs me that he has found in the stomach of a night heron a chicken as large as a pigeon. Now, the conclusion from the above facts is, that the night heron is catching all the smaller fish from our ponds and shallow streams. Trout, pickerel and perch are growing scarcer every year owing to this nocturnal fisher and I would respectfully suggest to the owners of trout fisheries the necessity of providing a grating screening for their race-ways, to prevent the nightly depredations of this terrible enemy to fish breeding. Especially is this necessary as trout always seek shallow water at night. I would also suggest to sportsmen the necessity of destroying these lawless fishermen.

S. W. HAMMOND.

A disagreeable discovery has been made in Fifeshire, which tends to destroy all confidence in fish, who appear to be quite as unscrupulous as retail tradesmen with regard to their own weights and measures. It seems from the account given by the *Dundee Advertiser* that one day last week a Pittenween fishing boat put into the Dysart laden with skate, ling and cod. One of the cod, of enormous size, was purchased by a ship carpenter who lives in a neighbouring village. On the fish being cut open, the stomach was found to be so exceedingly heavy that the carpenter was induced by curiosity to open it, and to his astonishment found that it contained an iron mallet upwards of six pounds in weight. This article now lies at the building yard where the carpenter is employed, and is an object of great curiosity to large numbers of persons who come to inspect it. The mallet is worth about seven shillings and sixpence, and the carpenter is satisfied that in purchasing the cod he made a good bargain; but if, instead of a useful and marketable article, the fish had stuffed itself with heavy rubbish to increase its weight, its purchaser would have suffered a serious loss. In the meantime, it must be admitted that since the day of the prophet Jonah no more singular instance of the voracity of fish has been recorded than the case of this cod, captured by the Pittenween fishermen. Indeed, nine big fish out of ten would infinitely prefer swallowing a prophet to swallowing an iron mallet.

Shot Gun and Rifle.

GAME IN SEASON FOR SEPTEMBER.

Elk or Wapiti, (*Cervus Canadensis*.) Red Deer, (*Caracus Virginianus*.)
Rabbits, common Brown and Grey.) Squirrels, Red Black and Gray.)
Woodcock, (*Scelopax rusticola*.) Pinnated Grouse, (*Tetrao Cupido*.)
Ruffed Grouse, (*Tetrao umbellus*.) Curlew, (*Numenius Arquaia*.)
Esquimaux Curlew, (*Numenius borealis*.) Sandpipers, (*Tringine*.)
Willetts,
Plover, (*Charadrius*.) Reed or Rice Birds, (*Dolichonyx orizivon*.)
Godwit, (*Limosa*.)
Rails, (*Rallus Virginianus*.)

Wild fowl generally after 15th September, and Ruffed Grouse also in many States.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

Just at this season one of the finest shooting grounds to be found anywhere, is in the vicinity of the Bay Chaleur, in New Brunswick. By taking railway to St. John, and thence 108 miles to Shediac, connection can be made by the Gulf Port steamers with Dalhousie, which is near the mouth of Restigouche river. All through the month of September, the marshy and grassy islands that fill the river swarm with wild geese and other water fowl, and in what is known as Eel river, which is but twelve miles drive from Dalhousie, curlew, brant, snipe, ducks, and geese, and numerous other varieties of wild fowl abound. The place is accessible by a wagon road, and canoes and Indians can be always had at Dalhousie, if not on the spot. It abounds with suitable feed, and here the birds tarry long in their migrations southward to the waters of the Chesapeake and the sounds of North Carolina. The shooting is equal to that found later in the places last named. The journey can be made in three days from New York via Bangor and the European and North American Railway, and the cost of a fortnight's trip should not exceed \$75, all expenses included. The climate of September and October is delightful, though liable to be interrupted by storms. Moreover, when the migratory birds have departed, other resources remain, for the sportsman is here upon the outskirts of the finest game country on the Atlantic. Here are a million and a quarter acres of primitive forest, traversed by many streams navigable for canoes, and abounding with moose, caribou, bears, pheasants, beaver, and various kinds of fur bearing animals.

A party of gentlemen, including Henry L. Brevoort, Esq., of New York, started for this region last week to call moose, intending to return 1st October. They went by railway to Woodstock, New Brunswick, and thence by stage *via* Grand Falls to the mouth of the Grand river, whence they took batteaux and *voyageurs* up the stream fifteen miles to the portage. At this point they find canoes and Indians that have been sent to them from the lower Restigouche, whose waters are reached by a portage of a mile and a half. Descending some twenty-five or thirty miles they reach the heart of the hunting territory. Our readers will some day be favored with an account of their experiences.

Now, as regards grouse shooting, some of our sporting friends make themselves almost ridiculous. Every day men who ought to know, waste sixpence (they always enclose a three cent stamp for answer, which is proper,) by asking us, "where shall we go to shoot grouse?" Why hang it, man, "go West." Sportsmen of Wisconsin generally go to Iowa; residents of Minnesota usually cross over into Wisconsin, and Iowa men *always* go to Illinois. There is no "chicken" ground like Illinois—unless you except Wisconsin, Minnesota, and Iowa. In Illinois, Iowa, and Wisconsin, you can drive an empty wagon at daylight out into the scrub-oak prairie, and bring it back at night filled with birds. At certain periods of the year we have seen them sell at five cents apiece in market—when buyers could be found. In those times a bird is worth just the price of a cartridge. To speak point blank, there is no species of game, except wild fowl and buffalo, so abundant in America as the pinnated grouse. All through the prairies wagon trails lead out to sundry points, and any fine day in September or October the teamster can whistle his lonesome way along, and sitting in his wagon knock over the fowl as they rise from the edge of the road. It is no trick to do it either; for the birds just get up quietly and fly in a straight line over the tops of the scrub a few rods and then settle down. No use to send a dog in for them, for you have only to jog on a bit, and let your horse put up another bird from the road. It is all very well to work a dog, but two men can beat the bush with all the success one could desire. We don't intend to mislead our eastern friends by inducing them to believe that game lies around promiscuously, waiting to be put into the bag, for grouse are like other birds—on some days they are more plenty than on others, and they seem to have their choice of ground. But if any one thinks we exaggerate, let him step into Washington market and he will learn from the dealers in game that tens of thousands of birds are brought to this city every year.

We read of early shooting, and the putting up of *coveys* of birds, and men boast of knocking over three at a shot as they arise from the stubble fields. Doubtless, on occasions, we should follow suit, if we had a gun in hand; but we don't fancy this practice of knocking over coveys, for it means that the birds are still young and under the wing of the hen. Later, they scatter, and are found singly most frequently. They are thus wilder and fly greater distances,

—The New York Athletic Club are to hold their annual fall meeting on Saturday, October 4th, on their track, foot of 133d street, East River. The prizes, as usual with this club, are gold medals, and much interest is being manifested by its members. The 100 yard race will doubtless be very exciting, as two of the entries are closely matched. The club's definition of an amateur is the following: "Any person who has never competed in an open competition, or for public money, or for admission money; or with professionals for a prize, public money, or for admission money; nor has ever, at any period of his life, taught or assisted in the pursuit of athletic exercises as a means of livelihood." Officers of the club—Colonel W. E. Van Wyck, President; Frank S. Babcock, Vice President; John H. Stead, Secretary; Henry E. Buermyer, Treasurer. The programme is as follows, and the list of entries we shall publish as soon as they are out: 100 yard running race; 440 yard running race; 880 yard running race, and one mile running race. Walking three miles, open to all amateurs. There will also be a handicap running race, once round the track (one-sixth of a mile) open to members of the club only.

The Manhattan's played the Staten Island club on the grounds of the latter at Camp Washington, Staten Island, on Friday September 5th, which resulted in an easy victory for the Manhattans. The day was all that could be desired. Many ladies were present, and the wicket unusually good. The bowling of Brewster of the Staten Island club was very effective, as he took six wickets. Ronaldson of the Manhattans made an excellent catch at slip, and will make a dangerous bowler. Hayward and Kersley made double figures for the Manhattans, while Duer, Filmer, and Davis the same for the Staten Islanders.

—The St. George's Cricket Club played the United St. Louis eleven on Tuesday. This was a two days' match. St. George's won the toss and sent in the St. Louis'. The batting was very fair considering they only arrived late at night, and had little rest. H. Temple and Lycett made double figures. The Bowling of the St. George's was unusually straight and effective; the fielding was also very close and steady.

We regret that we were obliged to go to press while the match was still on.

—The Manhattan's played the Zingari on Saturday, on their grounds at Hoboken

—The Athletic and Philadelphia base ball clubs played at Philadelphia on Monday last, with the following score: Athletics, 5; Philadelphia, 6. Each had earned two runs.

On the same day a game in Boston between the Boston and Atlantic clubs resulted in a victory for the former by a score of 15 to 10.

Military News.

Probably the oldest soldier now in the United States is Lieut. M. Moore, (retired) who entered the service on the 30th of April, 1812, joining the Thirteenth Regiment of Infantry, Colonel Peter B. Schuyler commanding, then organizing at Greenbush, opposite Albany, N. Y. Shortly after joining, this regiment was ordered to the frontier, but on arriving at Onondaga, it was divided, five companies being ordered to Buffalo, and five to Niagara. The latter (to which the subject of this sketch belonged) participated in the battle of "Queenstown," where Captain, afterwards General, Wool was wounded. He was with his regiment at the capture of Fort George, the subsequent pursuit of the enemy, and the battle of "Stony Creek," where Generals Winder and Chandler were captured. Returning, the regiment formed part of General Wilkinson's army in the movement down the river St. Lawrence, the contemplated attack on Montreal, and took part in the battle of "Williamsburgh," after which the army went into winter quarters at French Mills. In 1814 Lieut. Moore's regiment was ordered from Plattsburgh to Sackett's Harbor, N. Y., with the army under General Izzard, at which latter place it remained until the close of the war with Great Britain. The Thirteenth was one of those then consolidated to form the new Fifth. In 1821 he accompanied five companies of the Second Infantry, to which he then belonged, to Sault de St. Marie for the purpose of establishing a military post at that place. From here, in 1826, he went with two companies, "A" and "B," to the head of Lake Superior as escort to Governor Cass, who proposed to effect a treaty

with the Indians. Their only means of transportation were batteaux of their own construction, which the men rowed the entire distance up and back, their being no vessels on the Lake at that time. From here the same companies proceeded to Mackinac, when the barracks were rebuilt; then to Fort Gratiot, (a heap of ruins,) which they also rebuilt. In 1832 he was ordered with his regiment to the "Black Hawk" war, or as the late General Scott termed it, the "cholera campaign." In 1837 he participated in the Indian war in Florida enjoying (?) this delight (?) of a soldier for three years. In 1841 he was ordered to the Recruiting Depot at Fort Ward, and continued in this service until his retirement, in 1869. In all this time he was never in arrest or court-martialed. The old gentleman is still hale and hearty, the only regrets he appears to have being that he was not a member of Colonel Miller's regiment at Lundy's Lane, and that he was too old to participate in either the Mexican or the late war.

The reports of General Custer's in regard to the recent skirmishes with the Indians near the Yellowstone river, are exceedingly interesting and characteristic of that distinguished officer. The General must believe thoroughly in the effects of a military band, as to the crack of his rifles he always adds the inspiring strains of "Garry Owen." Suffice to say, that after quite an exciting fight, forty Indians were killed, and many were wounded. Our loss was comparatively small.

The New York Fire Department propose establishing a corps of sappers and miners to be used on the occasion of an extreme conflagration in blowing up buildings, etc., as a means to check the fire. One man from each engine company will be detailed for this purpose, and the corps will be thoroughly instructed by United States engineers in the use of explosives as well as go through a course of drill.

—At the battle of Gravelotte the French numbered 130,000 men, while the Germans numbered 200,000; and at Sedan 230,000 Germans attacked 130,000 French. The casualties in the first battle were 14,000 French and 20,000 Germans; at Sedan the French lost 14,000, while the Germans 10,000. In these two decisive struggles nearly 60,000 men were lost, yet this scarcely holds a candle to some of the little slaughters we had in our rebellion, a record of which cannot help but send a shudder to the heart of every true lover of his country.

—General Ord, commanding the Department of the Platte, is foremost among Department Commanders in rifle practice, and the monthly record shows constant improvement. The cavalry, strange to say, make the best scores as a rule. The system is not the Hythe or that followed at Creedmoor, and there is an effort now being made by the National Rifle Association of this country to establish a uniform system of target practice, both in the army and militia. We trust it will be successful.

—General "Phil" Sheridan, the well known advocate of celibacy, has been giving the Kanucks a chance to "receive" him. The General really enjoys, like all bachelors, these little "stag parties." At one time he had retreated slowly from Montreal, and was "just five miles away" from—somewhere in New Hampshire, the White Mountains, we think, and was fast making cover for headquarters in that Phoenix like city of Chicago.

—There has long been a struggle to abolish the practice of purchasing commissions in the British army. There is an opinion that similar steps will have to be taken in regard to our own army. Still in the British army it is an acknowledged fact, while in our case the fact is covered.

—Among the pleasant institutions of New York city is the rooms of the Army and Navy Club in 27th street. The club numbers 400 members, and is among the most successful organizations of its character in the country. The formation of a special club for army and navy officers is something new in "these parts," and very frequently you may see in the handsome apartments of the club many of our most distinguished officers of the service.

—Second Lieutenant Thomas M. Canton, of the Eighteenth Infantry, has, we regret to announce, been cashiered the army in consequence of drunkenness and conduct unbecoming an officer and a gentleman. It is said that drunkenness is the curse of the army, yet it seems hard to be compelled to cashier for this charge one who has but reached the first step as a commissioned officer of the army. We can but sympathize for one so truly unfortunate.

—Major Thomas T. Barr, Judge Advocate, U. S. A., has been stationed at Boston.

—First Lieut. James E. Bell, First Artillery, has been detailed as Professor of Military Science and Tactics at the University of Vermont, Burlington.

—Second Lieut. Frank H. Edwards, First Infantry, is on duty at the Military Academy.

—The officers at Fort de Russell, under the *soubriquet* of "Artful Dodgers," recently played a national game with some citizens calling themselves the "Ku-Klux." The "Ku-Klux" in this instance came out ahead.

—The Yellowstone expedition, or one portion of it, will return about the middle of this month.

—Lieutenant Colonel Drayson, on the cause and duration of the glacial period, and the probable antiquity of man, thinks he is so exactly right about it, as to place the last English glacier back some 31,840 years exactly. Only English critics say that he knows nothing about dynamics, and either despises or is desirous of revolutionizing modern terrestrial science.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

—The number of yacht clubs in Eastern waters is much larger than the general public suppose. In Boston and vicinity there are the following: Eastern Yacht Club, Boston Yacht Club, South Boston, Dorchester, and Beverly. The Eastern Yacht Club has been organized several years, and was incorporated by the Massachusetts Legislature in 1871. They have forty-five yachts, comprising thirty-two schooners and thirteen sloops. Aggregate measurement, 2,500 tons, o. m. At the latter part of this month they will hold their closing regatta for the season. The celebrated yacht *Faustine*, E. Y. C., which made such a fine run to England lately, is owned by George Peabody Russell, who is now a resident at Binstead, Isle of Wight, England. The Boston Yacht Club has forty yachts, about 550 tons, o. m. Their closing regatta takes place to-morrow.

—The fifth regatta of the Dorchester Yacht Club, of Massachusetts, took place last week over the regular course for the championship of the fourth centre-board class. They have sixty-two boats belonging to the club. The contending yachts were the *Bessie*, *Virginia*, and *Rockett*, each of which had won in its class. The wind was fresh from the southwest, and the yachts were reefed. They started at 4:20 P. M. The *Rockett* was the first to get away, and took the lead, which she held until the yachts passed "Half-tide Rock," when the *Bessie* became the leading yacht, which position she held during the remainder of the race, though the *Rockett*, which came in second, took the prize by time allowance.

The everley Yacht Club, of Massachusetts, has forty-one boats, and held their special regatta on September 6th. The prizes were given by Mr. Soheir, which included a consolation cup for the last boat. This club is practically a Boston club, and the boats are principally small, being under thirty feet water line.

—The annual election of the Oceanic Yacht Club, of Jersey City, resulted in the election of F. Hughes, commodore; Charles Taylor, vice commodore, and James Flagg, rear commodore.

—The schooner *Elsie*, of Boston and Dorchester clubs, was lately sold to Mr. Martin, of Boston Highlands, the latter giving the sloop *Violante* in part payment.

—A new pilot boat, the *Thomas S. Negus*, No. 1, to replace the *Jane*, lost last April, was launched from the yard of Mr. C. & R. Poillon, foot of Bridge street, Brooklyn, on Saturday, the 6th instant.

—The International Regatta held at Toronto on the 3d, 4th, and 5th instant did not fully meet the anticipations of the most sanguine, the proceedings of the second day especially being denominated a fizzle by the Toronto press without qualification. The regatta on the first day, however, for the Governor General's cup, was fair, ten yachts entering, and the contest between Lady Stanley and the *Ina* being a keen one. The latter is owned by Colonel Shaw, United States consul at Toronto. The distance was thirty miles, and the *Ina* was beaten by forty minutes.

—The Amateur Regatta on Saratoga Lake is now in progress as we go to press. The arrangements for boats, and the comfort of the competitors, are of the most perfect order. The Sheriff of the county has given his word that he will do his utmost to prevent any pool-selling or gambling along the lake shore, and has closed the gambling houses in the village. There are two races to-day. First prize for a beautifully designed cup, valued at \$500; pair-oared shells; two crews entered. Second prize a large silver cup; for single sculls; eleven crews entered. To-morrow, Friday, the first race will take place at three P. M.; double scull shells; one mile to stake-boat and return. The second race at four P. M.; junior single sculls; one mile and return. The third race at five P. M.; four-oared shells; one and a half mile and return; six crews entered. The following is the list of crews entered:—

For the Pair-oared Shell Race To-day—Nassau Boat Club, of New York, Oliver T. Johnston, stroke; Frank Brown, bow. Argonaut, of Toronto, Canada, R. Lambe, stroke; H. Lambe, bow.

For the Single Scull Shell Race To-day—James Wilson, Beaverwyck, of Albany; H. S. Truax, Potomac, of Georgetown, D. C.; M. J. Fenton and Charles Pipenbrink, Mutual, of Albany; Robert Leffman, Atlantic, of New York; William Hughes, Friendship, of New York; Charles E. Courtney, Union Springs, of New York; Frank E. Yates, Grand Haven, Michigan; T. R. Keator, Harlem Rowing Club, of Harlem; H. Lambe, R. Lambe, Argonaut, of Toronto, Canada.

For the Double Scull Race, on Friday—Beaverwyck Rowing Club, of Albany, James Wilson and William R. Hills. Mutuals, of Albany, Charles Piepinbrink and William S. Mosely. Argonaut, of Toronto, R. Lambe and H. Lambe.

For the Junior Single Scull Race, on Friday—Frank E. Yates, of Grand Haven, Michigan; A. A. Graves, Jr., Jos. H. Girvin, and A. G. Graves, Jr., of the Beaverwyck; John C. Sweeny, of the Friendship Club, of New York.

For the Four-Oared Shell Race, on Friday—Potomac Club, of Georgetown, D. C., D. Coughlin, stroke; A. J. McBlair, 3; S. L. Cropley, 2; H. S. Truax, bow; Z. T. Carpenter, substitute. Duquesne, of Allegheny City, Pennsylvania, Frank Brannon, stroke; Samuel Moody, 3; Geo. Scharf, 2; John Straub, bow. Pape Borge Club, of Cincinnati, Ohio, Daniel Brown, stroke; John W. Kirk, 3;

Henry Keylish, 2; K. B. Hauser, bow. Argonauta Rowing Association, of Bergen Point, New Jersey, Fred C. Eldred, stroke; Walter Man, 3; E. R. Craft, 2; Edward Smith, bow. Beaverwyck Club, of Albany, James Wilson, stroke; Daniel Doncaster, 3; Richard Gorman, 2; Torrance Gorman, bow. Ballston Rowing Club, of Ballston Springs, New York, J. S. Smith stroke; S. C. Meadbery, 3; Albert J. Reed, 2; J. M. Ramsdell, bow.

—The boat race between Pipenbrink and Moseley, of the Mutuals, and Wilson and Doncaster, of the Beaverwycks, at Albany, September 4th, was one of the prettiest that has taken place on the river for many a year, and while the Mutuals were successful, the Beaverwycks made a gallant race, and may feel proud of the result. The time of the three miles for the winner was twenty minutes and forty-five seconds, that of the losing club but nine seconds later, twenty minutes and fifty-four seconds. This for a three mile race with a turn, is the fastest upon record, the next to it being twenty-one minutes and forty-one and a half seconds.

—The Oneida Boat club of Jersey City will hold their regatta on Saturday, September 13th.

Scullers race for champion badge; eight oared barge race and a seventeen foot working boat race are a part of the programme.

—The Atlantic boat club hold their annual regatta on the Passaic river, New Jersey, on Wednesday, September 17th.

—The Friendship Boat Club will hold their annual regatta on Monday, September 29th, over the Pleasant valley course. Senior and junior sculls, a four oared race, and an open single scull race.

—Brown has agreed to Biglin's proposition for a race at Halifax three days after the St. John regatta, and has signed articles and forwarded them with the necessary money for deposit to New York to bind the agreement. The race will probably take place on the 20th inst.

—Mr. E. Hasee, of the Atlantics, and Mr. D. Roch, of the Nautilus club, will row a sculler's race on the Harlem river on Monday, September 15.

—A number of the members of the New York Rowing and Athletic Club have subscribed for another new medal. The medal must be won three consecutive times by a member in order to become his final property. The race is for single sculls one mile straight away, and to take place on Saturday, September 13.

We reprint from our second number the following rules adopted for the government of the International Regatta to take place at St. John, New Brunswick, on the 17th instant. We shall have a full report of the proceedings from our own reporter:

1. The races shall take place on the Kennebecasis River, on the usual regatta course, on the 17th day of September; or should the weather on that day prove unfavorable, on the first suitable day, thereafter.
2. All races shall be started in the following manner: The starter on being satisfied that the competitors are ready, shall give the signal to start.
3. If the starter considers the start false, he shall at once recall the boats to their first stations, and any boat refusing to start again shall be distanced.
4. No fouling, whatever, shall be allowed.
5. It is in the province of the umpire, when appealed to, but not before, to decide a foul. The boat decided by him to have fouled shall be distanced.
6. It shall be considered a foul when, after the race has commenced, any competitor by his boat, oar, or person, comes in contact with the oar, boat or person of another competitor, and nothing else shall be considered a foul.
7. Any boat taking another's (boat's) water does so at his own peril, and it shall be held that a boat's own water is the straight course from its starting point to its turning point.
8. Each boat shall turn its own buoy, the turn to be made in shore toward Rothesay.
9. If in any race in which more than two boats start a foul takes place, and the boat adjudged by the umpire to have been fouled reaches the turning point first, the race shall be decided as the boats come in; but if the boat fouled does not come in first, or if the umpire is unable to decide which boat has committed the foul, the race shall be rowed over again, unless the umpire shall decide that the boat which came in first had sufficient lead at the moment of the foul to warrant it having the race assigned to it.
10. Whenever the umpire shall direct a race to be rowed over again, any boat refusing to row again shall be distanced.
11. Every boat shall stand by its own accidents.
12. The decisions given by the umpire shall be final, and there shall be no appeal therefrom.

Art and the Drama.

AS an established institution, tragedy has been for years banished from our metropolitan stage, but at Wallack's there continued, until recently, to be presented the best old English comedies. Here was a green spot, where the intelligent and cultured lover of the drama could find an evening's entertainment, be pleased throughout the performance, and go home with the consciousness of having spent an hour or two in the most satisfactory recreation. Now these splendid, and we may correctly say, social entertainments, never lacked patronage—the theatre was always crowded. The lookers-on were literally composed of the very best people of the city. "Wallack's regular patrons" were as thoroughly well-known as were the ushers, and night after night you saw the same aristocratic faces, the same high-toned gentlemen and lovely women, while the young people were models of refinement and good manners. It always was an interesting sight in the palmy days of Wallack's supremacy to witness a large family party enter the boxes and take their seats. First came the mother and father, dressed with exquisite care, but properly old-fashioned, to suit "their style," next the blooming daughters, to whom the fond father assigned the best seats with a courtliness of manner that would have charmed Chesterfield. Then the beaux and brothers were "chinked" in, the "admirers," however, always managing, by the careful mother's direction, to be placed behind or by the side of the girls. All were in the best of humor, their faces rippling over with smiles—the very difficulties of getting packed away in the narrow seats adding to the zest of the affair, and every little annoyance proving a subject of pleasant remark or suggesting a practical but harmless joke. After all this bustle and rustle and suppressed laughter, and after due arrangement of ruffles, shawls, curls, and bonnets, the party would finally settle down into a display of ineffable contentment, the prevailing idea being, "We have a pleasant evening before us, and we are bound to be very

happy." Presently the ladies would timidly put up their tiny, jet-tubed opera glasses and study attentively, whether the equivocal individual across the parquet was a very homely masculine girl, or a young gentleman with his hair parted in the middle. Then the occupants of a private box opposite would suddenly throw signals of recognition to our happy group, and a battery of smiles and congratulations follow that were wonderful to behold. Then the happy father would notice an old gentleman with a great want of hair on the back of his head, encased in an immense white vest, sitting in the orchestra seats, armed with a heavy cane and a "field glass," and said happy father would point out this owner of the huge white vest to his daughters with the remark, "girls, there sits one of your mother's old admirers," whereupon the mother would express her astonishment at such a frivolous remark in the presence of the young people, then her eyes would snap and all would laugh, especially the young ladies. Then three young men, with a quarter of a dozen of white kid gloves on their hands, would station themselves in a conspicuous place in the corridor and attract the young ladies' attention by the affectation of earnest conversation, at which the beaux of the family party would become perfectly indignant, while the young ladies, strange as it would seem, rather liked the idea of being objects of so much attention. The gas by this time would be turned on in full force, the musicians crawl out from a hole under the stage and take their assigned places, when Tommy Baker would enter, looking as if he was abashed at the attention he attracted, then, showing his back in full to the audience, he would wave a piece of pipe stem as a baton, then throw his head over each shoulder, smile approvingly to see so many people present (he presumes for the only purpose of hearing his band), then, tapping the music stand, the overture, generally a medley, was thoroughly well done. Everybody, at this preliminary notice, would now settle down into a listening mood—even the quarter of a dozen of kids felt it imperative to sink into temporary obscurity—a new arrangement was made of the crowded personalities and compressed crinoline—the curtain is up!

Who ever noticed the excitement of a legitimate Wallack audience at this critical moment without a glow of pleasure? Programmes were not needed; the faces and persons of every actor or actors were familiar; in fact, the play was as near the audience as if it had been acted in the parlor and among the occupants of a private house.

Who will say that the legitimate drama failed of support, or that good acting has not its power to command patronage? Who that thinks rightly can otherwise than regret that intellectual entertainments have been thrust aside to be supplanted to "the poetry of motion, and gorgeous attire and splendid scenery?"

That we will ever get back to the "old times" is difficult to predict, but this much is certain, the meretricious character of the stage which is now so popular can possibly be *over done*. The power of capital to create mechanical effects is wonderful indeed, but the triumphs of great minds cannot be ordered as you order splendid attire and gorgeous scenery; they come only through the careful cultivation of God's gifts. At present, the large and most estimable class of people who delighted in the representation of the old English comedies at Wallack's have no place of amusement. To them the drama, as they understand it, has ceased to be presented in this city. How much society and the drama have lost by this fact is difficult to appreciate. Alas, for the day when Wallack's succumbed! But echo answers back, "it pays to succumb," and the manager's conscience is at rest.

On Tuesday evening The Wandering Jew was formally installed at the Grand Opera House, its merits being heralded as an entirely new and most powerful, romantic, and spectacular drama! If the greatest possible variety of scenery, and much of it done with most artistic style, will fill the great interior in which it is exhibited, then Mr. Daly's aspirations will be rewarded. Close upon this appeal to the eyes, follows on—

Thursday evening, September 11th, the opening of the new Lyceum Theatre, with a romantic spectacular drama, entitled Notre Dame, with a full chorus and corps de ballet.

We now have five first-class theatres appealing to the public for patronage, in all of which only the eye is appealed to. The notion among managers seems to be that all intellectual representations that will pay are impossible. The struggle for supremacy in the use of paint, ballet girls, minstrel music, and startling scenery, is gigantic! Look out for wrecks at the close of the season.

Italian opera in its grandest estate will soon be inaugurated, and the city, when this is done, will be fuller of operas, theatres, and other places of amusement than at any time in its history. Signor Salvini, accompanied by Signora Piamonti, will reach this city this week, and will open on Monday, the 15th instant. Mr. Max Maretzek announces the coming of Mme. Lucca, Signor Tamberlick, Mme. di Murska, with innumerable others of great fame, who are to establish once more the grand opera. Mme. Nilsson Rouzeand, with the expected arrival of Mr. Strakosch's stars, complete the extraordinary list of singers who are destined in a few days to be pouring out their musical notes to New York audiences, with the expectation that they (the audiences) will be most lavish with their notes. We promise to be overwhelmed.

* BROOKLYN.

The Brooklyn Academy of Music, which possessed from the beginning most of the requirements of a first-class building, was, from the unfortunate character of its interior, always dingy and uninviting. No force of gaslight

could remove the impression that it was a great cave, very cleverly arranged for dramatic representations. The men who originally colored the ceiling and selected the upholstery, must have looked forward to the time when the building could be used for some penitential purpose, possibly a monastery. For years this radical defect has remained, and the Academy has ceased to be of any practical value, except for some extraordinary use—a charity fair or a trumpery exhibition. In the summer just passed important changes have been made throughout. The seats have been renewed, the private boxes ornamented with crimson satin lambrequins, with rich draperies to match. But the most important and desirable work is in the substitution of new gas fixtures and the washing out of the old india-red wall, and the introduction of a light-pencil gray tint, set off with a due amount of golden stripes. A new era of usefulness promises to open, and we trust that the building, in most respects excellent, will become, as it should, a popular, and if anything a fashionable, place of amusement.

The new Park Theatre, late Mrs. Conway's, was opened on the 9th instant with a most excellent company, and so thoroughly "reformed" in its interior designs, decorations, and scenery that but little is left save its location to remind one of its for years most deplorable condition. Brooklyn is morally in great need of the inspiring effect of good, cheerful amusements, and it seems likely to be provided with them this coming winter. Mr. Samuells, though a young man, as a manager has a genius for his business which is even of more importance than experience; he will be a success.

The Brooklyn Theatre, under the management of Mrs. Conway, will open on next Saturday night with Othello. Mr. Edwin Booth, Mad. Jannauschek, Mr. and Mrs. Barney Wilhams, and Mrs. Chanfrau are named among the stars.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

BREECH-LOADERS. By GLOAN. New York: George E. Woodward. Orange Judd & Co., 1873.

If we are quite familiar in the United States with breech-loading rifles, perhaps better acquainted with them than any other people in the world, it is none the less true that we know hardly anything at all about breech-loading sporting guns. Such special works as have been written on this particular arm, of which W. W. Greener's book was the best, were rather to be regarded in the light of catalogues of breech-loaders; therefore any practical work on this subject, of a wider scope, must be of interest to the general American public. Gloan's book, is cleverly written, is to the point, and can only be the production of one who has thoroughly mastered, not only theoretically but practically, everything in regard to what must inevitably be the arm of the future. In books of this character, it is sometimes quite puzzling for the critic to determine exactly whether the work under review is, or is not the production of a gun maker, or written in the interest of gun makers, and Gloan's Breech-Loader, is a work of precisely this uncertain character. It is true, a certain prominence is given to those most excellent English gun makers, Messrs. Dougall, Greener, Westley Richards and Lang, and even our American makers, Parker & Brothers have some slight comment made about them, (though the Remington gun, is entirely ignored), but after a careful perusal, we are only too glad to give the book the highest praise for fairness. If the book does have the peculiar smack of an English book, and may or may not be written in the interest of the English gun makers, it by no means detracts from the excellence of the compilation. In fact there can be nothing objectionable in this. If English breech-loading guns are better so far than those of American make, if they shoot harder, have more range, are less liable to get out of order, by all means let us have them. Sportsmen have nothing to do with patriotism, they accept only the best arms, no matter where they are made. But where we differ from Gloan, and think he is mistaken, is where exercising somewhat of a prophetic power, he seems desirous of inculcating the idea, that breech-loading guns equal to the best English guns, can hardly ever be produced in the United States. If we have made the best breech-loading rifles in the world, not only for sporting but for military purposes, is there any reason why we cannot turn out breech-loading fowling pieces? A gun is not more difficult to make than a watch, and to day, American skill has triumphed in this special art of horology after but a few years practice. Arguments as to the greatest excellence of hand-made locks or even of barrels, have only a comparative degree of force. If a pistol or a rifle lock on military arms, can be made perfect enough to pass rigorous ordnance examinations, there is no possible reason why the same pieces in a breech-loader cannot be made equally good. Of course there is a *dilettantism* about these things, and we are the furthest possible from deifying it. If a man has the money to spend, his gun should be a perfect piece of art. We cannot paint by machinery it is true, and between a cup carved by a Benvenuto Cellini and a Colt's Revolver, there is a wide difference. If in the artistic inspirations, this more prosaic century has retrograded in the mechanical instinct we have fully progressed. Gun making has its secrets; it is a combination of the highest scientific and mechanical powers, but it is by no means the great mysterious art, in which so many writers try to enshroud it. The solution of perfect gun making has been found in many new mechanical devices, which now supplant the old hand work. In the United States, breech-loaders must drive out muzzle-loaders, and as soon as the demand sets in, not one manufacturer, but a dozen will make them, and there is no doubt that that good guns will be made. They may be plain guns if you please, democratic ones if you like. You may not be able to pass the thumb all over them without the finger nail catching, but they will undoubtedly be sound, honest and *square* guns. If the perfect sportsman lucky enough to combine unlimited means and elegant tastes, should want a \$1000 gun, there is no doubt that in a very short time, the American gun maker, will be perfectly able to make him a breech-loader fully worth the money. We entirely disclaim any idea of rivalry, and are free to acknowledge what was before asserted that so far English breech-loading sporting guns are superior to our own, but the idea we wish to convey is that this superiority cannot always be maintained. In the last ten years, England has taken more from us, in gun mechanism of every kind, than we have received from her. Having we trust in no captious spirit advanced our opinion, we now return with great pleasure to the intrinsic merits of the book. Every subject is discussed with singular good judgment, and the advice given is excellent. In fact, we have so good an opinion of Gloan's Book on Breech-Loaders that we trust to use it frequently for subtle points of gun lore, and we have no hesitation in recommending it to the attention of all American Sportsmen.

The best use you can make of seventy-five cents will be to buy a game of Avilude, the most instructive and delightful games ever published. If your dealers have not got it, send the money to West & Lee, Worcester, Mass., and it will be sent by mail, post paid.
"The best of its class.—Boston Evening Transcript."

Publications.**THE TWO SUCCESSFUL BOOKS OF THE SEASON.****I.****Hallock's Fishing Tourist,**

The Fishing Tourist, Angler's Guide and Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association."

ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who write a book mainly for the reason that they have something to write about—have something to tell the public which the public desires to know. The shortest routes to pleasure are laid down, and correct information is given as to the best means of conveyance, the expense of the trip, the secrets of the commissariat, etc. The author has avoided the use of technical terms, and thus made his volume all the more acceptable.—*Turf, Field and Farm.*

II.**Prime's I Go A Fishing,**

I Go A Fishing, by W. C. PRIME, author of "Boat Life in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vigorous descriptions of scenery and character, is distinguished by a refined wit, a droll humor, a strong love of the beauties of nature, and an enthusiastic devotion to the piscatorial sport. This book will please all who admire heartiness of style and exuberance of animal spirits in their authors. There are some interesting and well-told stories scattered through the volume, which exhibits on almost every page the handiwork of a man of graceful culture and wide reading.—*Boston Daily Globe.*

Published by Harper & Bros., N. Y.

HARPER & BROTHERS, will send either of the above works by mail, postage prepaid, to any part of United States, on receipt of price.

FOREST AND STREAM,

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Co.,
103 FULTON STREET, NEW YORK.

Terms, Five Dollars A Year, Strictly in Advance. A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns; nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which, if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yachting news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that de-alizes or brutalizes, nothing that is regarded as sport by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented *Downing* for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home," and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even *clamor* for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

Mr. SIMON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

For Forest and Stream.

MEXICAN SCENERY.

HIGH on a bare, volcanic cliff,
Above the sailing clouds I stand,
And gaze o'er many a shining eagle
Of outspread, flowery Mexic land.
Beneath me ancient forests lie,
Their green tops rippled by the breeze,
Their massive foliage heaves and swells
Like tumbling billows of the seas.
So thick they weave their leafy screen,
That scarce a broken sunbeam falls
Thro' the green arches to illumine
The sombre shadows of their halls,
And many a grotesque swinging vine,
Like glittering serpent climbs their tops;
The cactus twines its color'd crowns,
The aloe its red garland drops,
And tropic birds on spangled wings,
Flit thro' the fairest openings.

And here the browsing deer-herds roam;
Now scouring the extended plain,
Now lost in arbor of the wild,
Now wandering by the tumbling main.
Far thro' the thick, umbrageous depths,
The shy wild turkey leads the brood,
And swarms of chattering monkeys sweep
Along the summits of the wood.
High soaring in the upper air,
Vast cones volcanic rise like clouds,
Each with its vapory flag of smoke,
That ever the white crown enshrouds;
The Indian ages long ago,
Long ere the Spaniard trod the shore,
With awe beheld these mystic flames,
And hearken'd to the crater's roar;
Dreaming that goblins of the mine,
With incantations wierd and dark,
Mingled their orgies in the gloom
Of night, and lit each lurid spark.

Far down, amid the valleys green,
Soft scenes outspread the fairy land;
Flowers of gay hue and fragrant smell,
Broadcast are sown by Nature's hand;
All the rich colors that entwine
The rainbow, here celestial shine,
Each radiant with eternal bloom,
Each aromatic with perfume.

Afar I hear the tinkling bells
Of the slow caravans ascend;
And voices of the muleteers,
In soft, harmonious cadence blend.
Far off, o'er Guatemala's plain,
O'er peasant huts I see the smokes,
And from each rustic chapel hear
The evening bell-chimes' measur'd strokes.
And twinkling in the setting sun,
The distant city glistens white,
Belfry and cupola sublime,
Transfigured with the streaming light.

ISAAC McLELLAN.

A Day with the Naturalists.

STEAMER BLUE LIGHT,
PEAK'S ISLAND, ME., August 16, 1873.

EDITOR OF FOREST AND STREAM:—

I write you from Peak's Island, a place the existence of which is perhaps to you, as it was to me, not long since, unheard of.

But that was our bad luck. The denizens of Portland and of the adjacent towns know, and knew, of it and in its evergreen groves seek the relief which its constant, cooling breezes and delightful climate offer during the "heated term;" for up North and down East though it be, Portland does have its "heated term."

It is easy of access, for a trim little steamer, the Express, commanded, clerked, pursered, and steered by a most popular captain, makes a number of regular trips daily; with great groves of grand pines, and here and there a noble elm, furnishing shady, romantic walks and snug nooks for resting; with a craggy beach on its further side, against which the broad Atlantic drives its billows, and in an easterly storm, dashes surf furiously to its highest cliffs; with here and there, in the magnificent view seaward, scat-

tered dots of rocky islets, where, clear from man, the little petrel, the gull, and tern make their nests and rear their young in safety. Here, at sunrise, one can commune with Nature, and hardly realize that within a gunshot, just across the belt of pines, civilization is amusing itself. For on this side there is a quiet sheltered anchorage where the smallest boat can stay secure in the heaviest storms.

Each end of the island, two miles apart, is given up to merry-making. Restaurants, where, since the Maine law took effect, nothing stronger than coffee can be obtained—unless the landlord knows you. Strictly temperance houses, but if a gentleman *will* drink, why, they don't like to disappoint him. Swings, rustic seats, croquet grounds, bowling alleys, &c., furnish amusement to the crowds of pleasure seekers who come over to the island for a day's picnic. Sprinkled about among the groves are the white tents of many families who seek relaxation in a "week's camping out," with chowder, clams, and fishing *ad libitum*; and on a warm, sunny day, the scene is very cheerful. The woods are gay with white frocks and red ribbons; and boys and men bedecked with blue flannel shirts with great white anchors embroidered on the bosom, (for it is the "swell" thing here to be a yachtman;) and two boys with a punt and shelter tent, are happy in considering that they are yachting and camping out. Bands of music and singing parties enliven the evening.

But there is another side to this; now and then a cold easterly wind, with its inevitable accompaniments of fog and rain, comes upon us, and then, chilled and miserable, our gay campers take to their tents, wrap up in rubber, and happy if their roof sheds water, solace themselves with cards and pipes and pray for a shift of wind, which must come sooner or later. In the midst of the last driving storm, when all nature was clad in dismal gray, trimmed with water colors, I accosted a weather-beaten old fisherman with, "How long is this thing going to last, Captain?" (it's very safe to call a man "Captain" here—they don't aspire to General or Judge.) "Wall, I guess it'll tucker out after a bit. I never knowed but one of these sou'easters that didn't come to an end sometime." "Why, when was that?" said I. Said he, "This one," and I went my way sadly and sold.

The central parts of the island, though, on its western face are as quiet and retired as the ends are gay, and here with every facility at its disposal for successful work, the United States Fish Commission has established its headquarters for the summer. A large workshop on the wharf has been fitted up as a laboratory, the adjacent houses are occupied as quarters, and the wharf itself is turned into a first class dissecting table, where sharks, sword-fish, skates, and other great fishes, surrender their jackets and bones to the keen knives of the "Doctor" and his pupils.

And the little "Blue Light" lying quietly at her anchors of nights, bears daily, either to sea, or into some of the many sounds and bays into which Casco Bay is subdivided, a party of young men, enthusiastic in the cause of science, bound to search out, and with their own eyes see, the mysteries that nature has tried so hard to conceal.

Clad in many-hued and ancient garments, it is evident that "dress" is not their forte. Yet, when on Sunday, a "boiled shirt, stove-pipe, and frock coat," take the place of the daily costume; and some, quietly writing or working up their notes, others filling the pews of our little church, and some even the pulpit, it becomes equally evident that "dress" is not an infallible criterion, and that an educated gentleman can bring any dress to his level and not sink to its.

These, though, are not the views of a damsel, island-born and "raised," who asked me, "What is professors, anyway; and what do they do?" I told her; she mused, and then thoughtfully remarked: "Well they may be smart enough, but they don't dress up much; they're all married, I hear—I don't think much of 'em, anyhow."

She thinks better of them now, though, since one Sunday evening, when a "professor," hearing her really magnificent voice raised in a grand old hymn tune, with melodeon accompaniment, went into the kitchen and joined his fine

bass to her soprano. That Professor never got cold coffee again.

Armed and loaded with trawls and dredges, harpoons and fishing gear, at 9 A. M. the Blue Light sounds her whistle, and runs in by the dock, and then a string of hurrying men, with green buckets and scoop nets, bottles and sieves, take possession, and away we go, if it is a fair smooth day, right out to sea, till the color of the water proclaims deep soundings. Then in sixty to seventy fathoms of water we go to work to find what sort of bottom is there, what sort of fish, what sorts of animal life.

The lead shows soft bottom, and over goes the trawl, a large bag net, with a beam some ten or twelve feet long across its mouth, fastened at each end to an iron runner.

This machine is strung with a bridle to which is attached a towing line, and is lowered to the bottom. A good scope is given to the line, which is led in through sheaves on an iron crane to the drum of a small windlass on the fore-castle of the steamer. When ready, the ship is backed slowly, and the trawl drags along the bottom. It may catch on some unexpected obstacle, and perhaps be broken and torn to pieces. A simple contrivance, however, obviates much of the danger. When the tow-line, a three-inch hemp rope, is paid out its proper length, a piece of small rope is fastened to it just outside the outer sheave, and then the towing line is slacked out until all of the strain comes upon the small line, which is made fast inboard. A good lookout is kept, and should the trawl catch, the small line will break; immediately the engine is stopped and reversed, the larger line is slacked out, and before any damage can take place, the vessel has moved ahead toward the trawl, which is immediately hauled in for examination. Steam here saves hands, and our little deck engine soon rounds in a hundred fathoms, and the big net comes to the surface, is gathered inboard, and its contents dumped out upon the deck for investigation. And a motley collection it sometimes presents. In its pockets odd fish such as flounders and skates are entangled, and among its meshes strange crabs and starfish; while from the closely netted pouch tumble out anemones, sea urchins, and shrimps, with no end of varieties of crustacea and mollusks.

Once we brought up a great rock fully six hundred pounds in weight, and our little engine had to puff hard to get it safely up. Its presence in a soft mud plain, as the bottom here seems to be, some three hundred feet from the surface, was an anomaly, but probably ages ago it was torn from its birth place in the frozen north, and slowly drifted to the southward by an iceberg, until melting clear, it dropped, and there has lain, while countless generations of *terra brachalina* and other inhabitants of deep cold water have made it their resting place and home. A bottom temperature of 37°, while at the surface the mercury stood at 63°, seems to confirm my idea that we have struck here a little branch of an Arctic current. We have found here in this cold water belt several specimens that have before been supposed to exist no nearer to our coast than on the Georges Banks in 400 fathoms depth.

The dredge is a smaller and stronger apparatus, on the same principle, and is used on stony bottoms where the trawl would be torn and cut to pieces. It is a strong net bag that will hold two bushels, made fast to a pair of flat iron jaws; this is also dragged, but at a less degree of speed. When either is brought to the deck it is an amusing sight to see both professors and non-professors gather eagerly about the mouth, and as the contents emerge forty fingers go poking and picking at the heap; and the worms and clams, if not already as indignant as their nature will permit at the rough usage they have received, most certainly must become so, could they but hear and understand the hard names they are called. "*Myra aranaria*," sings out a voice, and a poor clam finds himself bucketed. "*Asterius vulgaris*," "*calista convexa*," "*nereus*," are called out rapidly, and the note taker puts them down, and a little white shell, a starfish, a clam, (to ordinary eyes,) and a big red worm are popped into bottles.

Or perhaps we have struck mud bottom, and the dredge comes up with a quarter ton of it. To an unscientific eye it seems of no value; but wait a bit; the load is emptied into

a big rocker sieve, a stream of water turned into it, and like gold diggers we cradle out our "find," till perhaps a gallon or so is left, and with it a harvest of worms and small crustacea. In one haul of the dredge, in which it was down but a few minutes, we sorted out eighty-three varieties of animal life; and I have been assured that over one hundred and fifty varieties have been taken in one haul.

If the day be rough, we run up into some one of the numerous smaller bays or sounds, into which three hundred islands and many long narrow peninsulas, subdivide Casco Bay, and we can always find a sheltered spot to work.

While the dredge is down forward there are more or less fishermen busy with hand lines aft, and according to the nature of the bottom, with more or less success. Let the dredge bring up a rocky bottom, with star-fish, crabs and shrimps, and ho! for codfish aft. The same kind of bottom, not quite so rocky though, with perhaps gravel, worms, and small shells, and silvery haddocks, the chief of chowder-fish are soon slapping our decks with their tails. Muddy bottom, and only hakes and flounders reward us. If with the cod-bottom we find a deep red sea weed, beautiful rock cod live there, but every where are pollock and skulpins, (*blanked* pollock and *blanked* sculpins, they are always called) eating away our bait and annoying us.

After a good day's work, and a dinner when the chowder and boiled cod would suit the most fastidious, and we return to our moorings in Blue Light Cove, with buckets and bottles full. And after a light island tea of hot biscuit, fried cakes, sponge cake, preserves, cold meat, fried fish, blueberries, clams, lobsters and mince pie, we retire and sleep under blankets. I say "we," but here do not include the Professors. Till midnight and an hour after, the glimmer of their lamps can be seen, as they, with their books and microscopes, study into the nature and habits of their prizes.

And here I will leave them at their midnight toil, and if you wish, tell you more next week of our island life.

PISeco.

THE WININNISH—CAMPING ON THE SAGUENAY.

NEW YORK, September 8, 1873.

EDITOR OF FOREST AND STREAM:—

I was much interested in the letter of Mr. J. U. Gregory, published in the FOREST AND STREAM of September 4th. So little is known of the wininnish that any information concerning that exceedingly gamey and plucky fish must be acceptable, and it is therefore to be regretted that your correspondent did not enter into details with reference to this comparatively unknown member of the great *salmo* family. I only wish it were in my power to add as largely as could be desired to the knowledge thus far obtained regarding a fish which, in my opinion, surpasses the salmon in succulence and delicacy of flavor, and is its equal in gameness and endurance. I have caught the wininnish, and bear cheerful testimony to the high claims which have been set up on its behalf, particularly by that veteran of the art, Genio C. Scott, who, by the way, is the only author who has treated of this "rare delicacy of the frozen latitudes of the Canadian forests." [Excepting Hallock's Fishing Tourist, pp. 179-82.]—Ed.

As I have not only had the good fortune to catch the wininnish, but to have eaten of it, fresh from the foaming rapids of the Saguenay, I must take the liberty of correcting an error into which your correspondent has fallen with respect to the color of the fish, which, he says, "is white instead of being pink-color, like that of the salmon." Probably this is a typographical mistake, as the flesh of the wininnish is really a deeper pink than that of the salmon, and certainly more *pronounced* than any trout I have ever seen. As to its pluck and endurance and game qualities generally, it is hardly possible to say too much for it in this respect. It is no easy matter to play a four-pound wininnish, and requires no ordinary patience and skill to land him after a contest not unfrequently of more than half an hour in duration. I have heard of wininnish repeatedly leaping over canoes in their desperate efforts to escape, and I have a vivid recollection of their saltatory performances while fishing at the Grand Discharge during a part of the summer of 1872.

Having been informed, while spending a few days at Tadousac, of the fine sport which some of the visitors at that picturesque resort enjoyed on the banks of the Saguenay, near Lake St. John, I determined on making the trip and satisfying myself. Arriving at Chicoutimi, which is at the head of navigation, I took a private conveyance to the foot of the first rapids, and crossing at that point in a canoe, manned by two stalwart and experienced *canotiers* of the well-known Savard family, was, after many a hard jolt, and an hour and a half of the roughest sort of riding over the roughest kind of road, set down at the mansion of my guides. It was about eight o'clock in the evening when we arrived, and a pleasant company of woodsmen, with a sprinkling of fair Canadiennes, were assembled in the one-room mansion of Savard *père*. A portion of these were on the floor, treading the mazes of a regular old-fashioned country dance, and keeping admirable time to the music of a rustic Paganini. Then there were hornpipes and jigs that for variety of steps and grace of movement would have done no discredit to the Terpsichorean performances of some of our best "minstrel" companies. Take it all together I doubt if in the great city of New York, with all its boasted enjoyments, a happier party could be found than the party assembled that evening within the four wooded walls of the *habitan's* humble dwelling.

The following morning, bright and early, we left the Savard domicile, and squatting in the best canoe, paddled by the two *canotiers* aforesaid, swept over the broad, still reaches of the Saguenay, hooking an occasional pickerel as we proceeded on our way to the place of destination, some twelve miles up the river, and about six from Lake St. John. For two of these miles the Saguenay is broken into a fierce and boiling torrent, along which no canoe has ever passed in safety. We had, therefore, to disembark, and traverse two miles of the roughest, rockiest, most intolerable of roads which I have ever travelled over, even in Canada. Imagine the banks of a river strewn for miles with stones of all conceivable sizes and shapes—some as round as a ball, and as unsteady under the feet, some sharp and angular, affording scant hold even for the sure-footed Capricornus himself—imagine all this, with here and there huge rocks fifteen or twenty feet high, with faces almost as flat as a smoothing iron, and up which we had to clamber as best we could, and you can have some conception of the approach to the Grand Discharge. However, we got there in course of time, and were repaid for the labor and fatigue of the journey. It was evening when we arrived, and we had little time for piscatorial pleasure, but the scene alone was worth the ordeal through which we passed. Here at the head of the first rapid below the Grand Discharge the Saguenay flows along as placidly as a meadow brook, and here we were gladdened with the sight of many a dorsal fin protruding over the surface. In this respect, but in no other, does the wininnish resemble the shark. "*Voilà le wininnish!*" exclaimed our guides, as they pointed to several small triangular objects moving slowly on top of the water, and almost invariably against the current.

Our camp was erected on a beautiful green sward on the edge of a forest of spruce and birch, and our bed was made of the tender, aromatic branches of the spruce, that diffused a peculiarly agreeable odor. Except at this point the river is thickly wooded down to the water, and the forests on either bank, we were told, are "full" of bears. Indeed, we had evidence of their whereabouts in the footprints within a few yards of our camp—a rather close proximity, it must be admitted, but if they did take a peep under the canvas we were blissfully ignorant of their visit. To bed at eight and up at four, after such a sleep as fully rewarded our toil of the previous day. A hurried breakfast took the edge off our appetites, and a few steps brought us to our casting place, on the flat surface of a small boulder, just where the rapids begin. Hastily putting together an eight-ounce split bamboo, and selecting two favorite flies—red body with light grey wing and crimson tail—we made our first cast within a few feet of a small, black, moving object some fifteen yards distant. Again and again we place the tempting lure right before the eyes of the coveted treasure, but all in vain. With a provoking indifference, wininnish after wininnish sails slowly on, and we have our trouble for our pains. Surely there must be something wrong. We suggest in as good French as we can command that our fly is not of the right kind or color.

"*Oui, oui, monsieur, ne changez pas les mouche.*"

And following our guide's advice, we do not change the fly, but resolve to test it to the end. At last, after repeated casts, and at least an hour's pacing up and down, now above the rapids in the still water, and then in the foam-flecked torrent, we have hooked our first wininnish. Taking the fly beneath the surface and hooking himself, he ran out about ten yards of the line before the reel ceased to revolve. Judging from the spirit and strength displayed I concluded that I had hold of a four-pound fish, and being fully apprized of his reputation for gameness I prepared to deal with him accordingly. Reeling up as the line slackened I had hardly ten feet gathered in when the handle of the reel was reversed with a jerk that set my fingers a-tingling, and out went twenty or thirty feet more of my woven waterproof. This was something more than I expected, and as I had but a few yards left, I had certain serious misgivings whether my grilse rod was not better adapted to this kind of work. Fortunately, however, my fish was more accommodating than I had hoped, and after walking me up and down the bank of the river three or four times, a distance of a hundred feet or more, and making various little excursions in tangential directions, he consented, after some floundering and splashing, to be taken ashore in a landing net. And what a beauty he was! A few ounces under three pounds, he gave me as much sport as a five-pound grilse. There, as he lay on the green sward, no salmon could look brighter or more beautiful. With the exception of the forked caudal, the resemblance to the *salmo salar* was most striking. There were the irregular, black markings above and below the lateral line and on the gill cover, but if my memory is correct the head of the wininnish is a little larger in proportion to its size than that of the salmon. It is this marked resemblance which has doubtless suggested the title of land-locked salmon; but as you are, of course, aware, the real salmon is found in the same river with it, and goes up the tributaries of the Saguenay to deposit its spawn. The wininnish has therefore the same means of egress to the sea, but I understand it is not found in the St. Lawrence, and, I have been informed, spawns either in Lake St. John or in the streams which debouche on that magnificent sheet of water.

Several captures rewarded my efforts that day, but owing to the lateness of the season, or some other cause, I was not favored with an abundant take, and after three days' fishing, during which I netted a couple of dozen wininnish, I concluded to strike camp and return to the great metropolis.

I should state here that of these, I caught three or four

with an artificial minnow in trolling, but all were under three pounds. The wininnish, however, attains much larger proportions, and I was assured by several dwellers on the Saguenay that it is no unusual thing to catch them weighing six and seven pounds, and they have been caught something over eight pounds. Cooked fresh from the river they are, to my taste, sweeter than the salmon, and, as I have stated, their flesh is of a deeper pink color. The dorsal fin and tail are much larger in proportion, the latter being more forked than that of the grilse. As to the number of rays in the dorsal, pectoral, and caudal fins, the structure of the gill covers, palate, maxillaries, pharynx, &c., those points I leave to the anatomist to determine. It is to be hoped, however, that they will be found all right on proper inspection, and that nature has made no mistake in these particulars. And so I leave the wininnish to the tender mercies of science, trusting that it will think none the less of it if it fail in the requisite number of rays, and if its pectoral and ventral fins are not as correctly located as they might be. One thing is certain, that it a most worthy member of the salmonidae, that it is inferior to none of its varieties, that it should be better known to the piscatorial fraternity, and that its introduction to some of our northern rivers and lakes would be a decided advantage. You can do a great deal yourself in this direction, Mr. Editor and as I have heard that it is your intention to get up a museum of the finny tribe, I trust among the first contributions thereto will be one of these beauteous denizens from the deep brown waters of the profound, placid, turbulent, and foaming Saguenay, for it is all these together, and "more too."

Let me say, in conclusion, that there are some huge pike, or pickerel, in the still waters of this grand and gloomy river, and that on my way homeward to the Savard mansion I caught with a troll seven fish, weighing in the aggregate forty pounds—two of a pound and a half each, two of five pounds each, two of seven pounds and a half each, and one of twelve pounds. Three escaped, and of these one was estimated at about twenty pounds. One of the seven captured had a deep scar on its side, the result of an effort on the part of a bigger *esox* to assimilate the smaller unto itself. Truly yours,

J. MULLALY.

THE EAGLE AND THE TOM CAT.

A COMBAT IN THE AIR.

EDITOR FOREST AND STREAM:—

I'll tell you how an eagle lost its mate, and how we lost our old white tom cat. Away down in the southern portion of Monmouth county, New Jersey, one beautiful autumn morning, two sportsmen armed and equipped for a day's partridge shooting, emerged from the door of a country tavern. A resident of the village, a capital shot and a thorough good fellow, accompanied them as guide. They had scarcely crossed the threshold when an object high up in the air arrested their attention, an object that never fails to bring a thrill of pleasure to a naturalist, or even a casual observer. It was a noble specimen of the bald eagle. The fish hawk, or osprey, on whose industry he had lived so bounteously all the long summer had migrated to a more congenial climate, and now our eagle had left the neighborhood of the sea to seek further inland, by his own exertions, his daily fare. How splendidly he sailed over our heads; with what ease his powerful pinions enable him to sweep around the whole horizon. A moment motionless in mid air, as something arrested his attention, then swooping down with swiftest dash, to rise again disappointed or dissatisfied with the object. We watched him a long time, as in concentric circles, now higher, and then lower, he hunted the country and finding no breakfast there, sailed away, and we saw him no more.

"Well," Lanning, I said at last, "that was a grand sight, and I never weary at looking on our noble emblem bird; and then only is he fit to be called such when he seeks and captures his prey by his own bold, free flight and by his own exertions. At other times I despise him, as when I see him sit for hours on some dead limb by the sea, watching the active fishhawk capture his prey, and then turn robber; or when I sit in my blind on Chesapeake Bay, and see him perched on the tallest tree by the neighboring shore, listening for the report of my breech-loader, and looking if I have struck down some noble "canvas back," to fall dead beyond the reach of my recovery. In the event I do not have to wait long, (his eye is more unerring than mine;) he launches himself at once, and only avoiding the spot from whence the fatal shot was fired, is over the duck with almost the speed of thought, poises a moment, then grasps the object by the neck, carries it back to his accustomed perch, where in sight of my eyes and almost in sound of my curses, he picks its bones." Turning to Abrams, our country guide, I asked if the eagle frequented the neighborhood, and if so where was his mate, for you rarely see a solitary eagle in an out of the way place. In reply, he said:—

"There were a pair of eagles here in the spring; in fact that pair had been around the neighborhood a good many years, and had their nest always in the big woods you see on your left. Well, we got kind of used to those eagles, and I liked to see them sailing around even if they did sometimes pick up something they oughtn't to. But one day last spring the eagle you saw just now lost his mate, and we lost our old white tom cat, that we set great store by, at the same time.

"I'll tell you how it happened. The spring had been a very cold one, snowing and raining almost every day, and

freezing hard at nights. We had our sheep under shelter, a long pen with a sloping roof, thatched with straw, but the weather was so severe that when the early lambs came they froze to death as soon as they were dropped. In throwing out the first dead lamb it happened by accident to fall upon the sloping roof; but it didn't stay there long I can tell you. Those eagles were about every day and were mighty hungry. I had hardly got away from the stock yard, when one of them came out of the sky like a flash of lightning, and picked up that dead lamb before you could say 'Jack Robinson.' I was rather glad she (for it was the female, you can tell that by the greater size), took off the lamb, for it would save me the trouble of burying it when the warm weather came. As the other lambs died, and there were a good many of them, we threw them on the roof, knowing the eagles would soon carry them away. At last the weather grew warmer, and no more lambs died. Still the eagles paid us daily visits as usual, for they seemed to like 'spring lamb' as well as city folks, even if it was a *little off*. I had just come out of the door one sun-shiny morning, and saw the eagle sweep out of the woods, then suddenly turn in her flight, directing her course towards the sheep pen, as she had often done before. Aha, I said to myself, no 'lamb chops' for you; but swifter than my thought, she dashed down, and before I had even time to wonder, the whole thing was out. Our old white tom cat had gone on the sloping roof to rest himself, after a night's mousing or courting, and lay there all unconscious of danger, stretched out in the sun. Of course the eagle had gone for another lamb. She only woke up a small lion. I tell you there were fur and feathers at once. With a terrific scream, the eagle struggled to rise in the air, her claws planted deep in old tom's stomach. With a horrible squall the surprised and infuriated cat clawed and scratched, and drove her fangs in the eagle's neck. The screams of the one and the squalls of the other, were something frightful. The feathers drifted one way and the fur floated another, as the eagle bore the cat higher and higher in the air. But it didn't last long, that fight. Like a rough and tumble fight, something is bound to happen soon, and it did happen sooner than it has taken me to tell it. A hundred yards in the air, the cat had given the eagle a fatal bite. In a moment her head drooped, her wings collapsed, and swifter than they had ascended they fell together on the frozen ground. When I reached the spot they both lay dead in a sort of fatal embrace; the force of the fall had killed the cat and he had killed the eagle. And that you see is how that eagle lost his mate, and how we lost our old white tom cat.

CANVAS BACK.

BASS IN TROUT WATERS.

HONEOYE FALLS, September 10th, 1873.

EDITOR OF FOREST AND STREAM:—

Since the publication of my article in which I placed the plebian bull-head next to the lordly trout as a profitable fresh water table fish, I have been expecting some one to take up the gauntlet thus thrown down, in order that we might have this subject well ventilated, but as no one has seemingly cared to break a lance in any such tournament as that, I have concluded to try again. First, to correctly define my position, I will say, in all that I have ever written upon fish, the question of *profit* is the one ever uppermost, for, as is well known, fish breeding is my business, and although I love it, it is not my pleasure. With the sport of angling, which has so many enthusiastic votaries, and whose able pens so well recount and describe its pleasures in the pages of FOREST AND STREAM, I do not propose to interfere; but having paid some attention to the increase and profitableness of many of our fresh-water fish, I will give my opinions always as a fish culturist and not as a sportsman.

In your issue of September 4th, "Piscator" enters his protest against the indiscriminate introduction of all kinds of predatory fish into the waters of the State, and especially the introduction of bass in trout waters.

No doubt but what the Commissioners believe they were right in putting bass in the Racquette, but with all deference to those gentlemen, to whom the State of New York owes much for their invaluable services, I am among those who think that they made a serious blunder in this matter, and will be glad to hear from the other side of the question and be set right, if wrong, as the truth in these matters is of far more value than any man's "ideas."

One of the reasons given at the time that the bass were put in, was that the trout were being exterminated, and consequently but little fishing was done there compared with former years, and that the bass would be more valuable to the inhabitants of that region than the trout (?), that there would be ten pounds of bass to one of trout, and so the people could have plenty of fish all the year round; also, that the pleasure of a few sportsmen who visited that region for a few months in the year was not to be put in comparison with this; all of which would be very good if it were not for the fact that those transient sportsmen whom the few trout lured farther into the wilderness than any amount of black bass could ever do, employed the people as guides, boarded with them, were transported by them, and left money enough there in those few months to support them the rest of the year, and in this way more than compensated them for any difference in the number of pounds of fish. The Commissioners refer to this matter in their report for 1872. They say:

"Some species live on the product of vegetable matter, being the harvesters of the fields of the sea, in which there is a yearly growth of this nutritious food of an amount rarely estimated.

"Of these species a few, such as the whitefish and suckers, are themselves fit for human food, but they are principally useful as furnishing the support of more desirable varieties. On the land grain and grass are grown to feed cattle, which are again converted into butcher's meat for the human race. In the water the same course may be pursued, or it may be carried one step further. Analogous to the system of tillage by plowing in clover for manure, the product of water vegetables may be consumed by crustaceous and inferior fish, which again may be left as prey to larger and more marketable kinds. While on this analogy, it may be suggested that rotation of crops may be as advantageously introduced in pisciculture as in agriculture. In a portion of France where the land is low, and can be overflowed at pleasure by a system of dyking, crops of grain and eels are alternated, the latter being the more profitable; but this is only the germ of the true principle. When one sort of root or grain or vegetable is repeated on the same land it is found that the soil is exhausted of its food, while its enemies are augmented in number. Identically the same thing occurs with fish that are kept in one locality. They use up their food and increase the list of their foes.

"So soon as this happens they suffer, and should be supplanted by a different species, living on different food, and having a totally different class of enemies. Wherever this has been done the effect has been surprising, the new species increasing enormously for the first few years, and then meeting the same fate as their predecessors.

"It was on this theory that your Commissioners acted in introducing black bass into some of the lakes in the wilderness of this State which were once inhabited by speckled trout, but which have long since been practically depopulated, and a similar benefit is confidently predicted."

This theory is very plausible, but let us see how it is supported by fact. In the first place, it is hardly fair to compare the culture of fish to that of grain, or reason from analogy when the objects are not analogous; but to dig right into the case, what are the enemies of trout? Loons, kingfishers, wading birds, mink, otters, man, parasites, &c. And are they not all the enemies of bass as well? And concerning the question of food, are not both fish piscivorous and insectivorous in about an equal degree? What article of food does the trout consume that the bass will refuse? And where has this been tried with such surprising effect?

If the Commissioners, acting on this "theory," had stocked these waters with whitefish, siscoes, smelts, or even carp, they would have conferred all the benefits alluded to above without injury to the trout.

It would be as well before closing this article, to look at this "theory" a little.

The waters of the Adirondacks have been the home of trout perhaps hundreds or even thousands of years, and when the white man first came they were swarming with them; they have been decreasing perhaps twenty years, certainly not more; and is this attributable to the failure or exhaustion of their food supply? If so, it is singular, as the insect breeding woods still remain, and the waters are undiminished. The fact is that there is more fishing out of season than there should be; the demand in the cities has stimulated those inhabitants for whose benefit the bass were put in to catch trout in the winter, when the weather will permit them to be transported, and a false taste among monied parvenus who will buy them out of season encourages it.

The last two winters I have seen the fish stands in Albany filled with them in January and February, and two years ago, while there, I called on several sportsmen and tried to stir them up about it. They, however, did not take any action in the matter, and so Albany is well supplied with brook trout all winter.

This is the real reason why the trout are decreasing; and while I disagree with the Commissioners about their using up their food, I fully concur with them that one enemy at least has increased, and that one is *man*.

FRED. MATHER.

PRAIRIE CHICKEN SHOOTING.

TREMPELAU CO., WIS., September 13, 1873.

EDITOR FOREST AND STREAM:—

Remarkable are the powers of locomotion. I have been shooting chickens for the last two days in Trempeau Co., Wisconsin, with an enthusiastic English friend, who, disgusted with the opening of the season in Argylshire, absolutely packed up guns, sporting rig, and all, and with a dog, took steamer from Liverpool on the 14th of August, and on the 8th of this month telegraphed me in La Crosse from Chicago, something to this effect: "A dog, a gun, and a man lost in Chicago. Please provide for me." An hour later I should have missed his telegram. Two days ago my friend made his appearance, and we have been hard at work ever since. Last year I had left a brace of dogs with a farmer friend of mine in the neighborhood, and was delighted with the excellent training they had gone through. Nothing could have been more amusing than their conduct towards their green English cousin, a fine specimen of the English pointer. I prefer very much open prairie shooting, and rarely follow the birds into the corn ridges, and both my dogs had been taught to jump occasionally clear up out of the high grass to show themselves. The English dog seemed at first fairly amazed at this performance, but whether from force of example or not, yesterday, having got over his astonishment, we were both surprised to see him make one or two futile attempts of the same character. Yesterday evening, however, we withdrew him from action. His long travel must have made him footsore, and not understanding how to manage the tough resinous grass, he cut himself a great deal. His performances were, however, in the highest degree creditable, and the methodical way in which he worked up every foot of ground, showed his admirable training. I am pleased to say that Lion is to

end his days in this country, and some day I trust to inform you of the good deeds of his offspring.

My English friend used a gun I have never yet seen in the United States, Mercott's breech-loader, which has no hammers. Its shooting was admirable, and its mechanism simplicity itself. I had a Purdy C. F., 12 bore, bought for me by my friend, and I have been delighted with its performance. I somewhat surprised my companion by the weight of shot and charge of powder I used. Chicken shooting and the characteristics of the bird, I need not describe, as I suppose most of your readers are familiar with it. I think birds are getting more shy, and less plenty every year, even in this neighborhood. Our bag has been however, remarkably fair. Yesterday was our best day, my English friend taking to it naturally, and dropping his birds in splendid style. To day birds have not been quite as plenty. Our total for the two days has been thirty-seven and a half brace. Birds in tip-top order, with a fair proportion of old birds. Grass thicker and tougher than I have seen for some years. My English friend says that he is very certain that the condition of the game in the old country must bring over here a number of English sportsmen. Perhaps I may induce him to drop you a line giving you an Englishman's experience in the field. He is inclined to think that English shooting theory is all very fair, but that in some respects American practice is quite as good. Strange to say, he is enthusiastic over my dogs, and well he may be. What higher compliment could he pay them than by wanting to take a six months puppy of mine, born and bred within six miles of where I am writing this, back with him to old England. He says our dogs have a toughness and rapidity of gait which might be useful in England. This is rather a letter about dogs than birds.

T. S.

AMERICA'S GAME AND FISH SUPERIOR TO THOSE OF EUROPE.

A PARTRIDGE, fat and tender, is as good as a mushroom. Truffles do not improve woodcock. The birds can afford to go it on their own hook without any assistance whatever. So with such fish as the pompano, the mountain trout, the Jack salmon and the shad. They are able to stand alone. Over here they don't stand at all. Their best fish is the crawfish and the snail, for the lobster is indigenous everywhere, and is not to be counted in the list at all. They know nothing of the soft-shell crab, of the terrapin, or of the oyster as a cookable viand. Their turbot will not compare with our halibut, nor their sole with our shad. The English white-bait is simply a minnow, and only a trifle better than a smelt. In soups, which is a thing of condiments, they do excel us. As a general rule their service is neater than ours. But you can give, on a few hours' notice, a better dinner at the St. Nicholas, in Cincinnati, or at Rufer's, in Louisville, wines included, than you can give in Paris, at the Café Anglais, or in London at the Burlington. The American prices will range somewhat higher, certainly. But we pay high duties on wine, and it is there that the figures will chiefly tell in the bill. Not much difference will be found as to the dishes.

A word or two about these prices. To be sure, there is considerable art in ordering a dinner, involving both a knowledge of the French language and a knowledge of the particular restaurant where you are dining. The American who understands neither may expect to pay thirty per cent. more than other people who do. Ignorance of every sort, and all over the world, has to be paid for. But, at the best, he who expects to dine like a swell must also expect to settle like a swell. I have never heard of a good, first-class cheap dinner in Paris. At the Diner de Paris, where they charge you six francs (\$1 50 in greenbacks), the food is all messed, and the wine is sour. There is no thoroughly good *table d'hôte* at a fixed price in Paris. When you order *à la carte*, you will have to take the consequences, and \$3 or \$4 a head will secure a square, well-served meal—not gorgeous or elaborate—and that is all. It is sheer nonsense to talk about cheapness. If one is to live like a nabob he must fetch plenty of money with him and spend it freely.—H. W. to Louisville Courier-Journal.

—What is the difference between an angler and a dunce? One baits his hook; the other hates his book.

—A good many people have expressed the belief that Professor Wise is half crazy, but according to last accounts he isn't by any means as *flighty* as he was.

—They are building snow sheds, Rocky Mountain fashion, at the Cobequid Mountains, in Nova Scotia, on the line of the Intercolonial Railroad.

—Prolific copper mines have lately been discovered at Antigonish, Nova Scotia, and new coal veins about four miles from Port Hood, Cape Breton.

—The Blooming Grove Park Association has been presented with four deer, six English pheasants, and two geese, from the estate of John Magee, Watkins, New York.

—In Smileytown, Kentucky, a watermelon has been found without any vine. It grew directly from the roots within one inch of the ground. The seed was brought from Nicaragua.

—It is stated that in all the country between the valley of Truckee and that of Salt Lake, a distance of nearly 600 miles, there lived, when the Central Pacific Railroad was commenced; but one white man. Its civilized population is now nearly 100,000.

—San Francisco institutions are especially flourishing. The population is estimated by Mr. Langley to be 188,000, of whom 12,000 are Chinese, leaving 176,000 liable to make deposits, which now aggregate \$43,731,223. This gives a depositary representation of \$248.50 to every individual in the community, and is far in excess of any other portion of the globe. The number of actual depositors being 49,305, the average to each is \$886.95 gold, equal to \$1,020 currency.

From the Canadian Monthly.

THE MOCKING-BIRD.

BY CHAS. SANGSTER.

THE mocking-bird sits in the old apple tree,
Jovially, jauntily singing;
Who trills a daintier song than he?
With a wilder gush, or a deeper glee,
Fresh from his glad heart springing?
Up steps my passionate oriole,
And sings till you'd think the bird had a soul,
So mellow, and deep, and rich the strain—
Song-mist and sweet showers of music rain.

He has a rare touch of rich humor, too:
Up in the maple perching,
Hiding, and singing a score of songs,
Until the birds appear in throngs,
Each for its own mate searching.
Now like an absolute bird of prey,
Scaring the terrified flock away;
Sudden the flutter, the flight absurd—
Is he not laughing, the jovial bird?

My robin peers out from his cage in the hall.
Strutting, and fluting loudly;
Rapid and clear is his morning call,
Graceful and cheering his madrigal,
Bird never sung more proudly;
Back to the apple tree flies my thrush,
Strikes a fine chord through the calm and hush,
'That follows my robin's melodious strain,
And gives him his strophes all back again.

Bobolink whistles his treble note,
Rossignol sings a minute;
Delicate airs up the ether float.
Melody pours from each vocal throat,
Tanager, jay and linnet.
Let them all flutter in plumage bright,
Warble and sing from morn till night,
Still, my plain mocking-bird there in the tree,
Proves himself master of minstrelsy.

AMPERSAND MOUNTAIN.

A BIRDSEYE VIEW OF THE ADIRONDACKS.

Dr. W. W. Ely, of Rochester, whose valuable map of the Adirondack region is well known and properly appreciated by most sportsmen in this part of the world, has lately addressed a letter to the *New York Commercial Advertiser*, which we are conferring a benefit upon our readers in copying. Such emanations from gentlemen "who speak by authority, and not as the scribes," are rare, and ought to be widely circulated and carefully preserved. The Doctor writes in this wise:—

"Those who are familiar with the Saranac lakes and their surroundings will at once recall the position of Ampersand Mountain, lying southeast from the Middle Saranac, or Round Lake, from which its base is about two miles distant. The Stony Creek Mountains, which extend westward from Ampersand, form with it a barrier, which obstructs the view of the higher Adirondack ranges from this central lake and its vicinity.

"Ampersand is one of the lesser mountains of the western range, of which Whiteface, Seward, Sandanona, and Mt. Emmons are the principal peaks. Its altitude has not been ascertained. It may prove to be somewhat lower than Blue Mountain (or Mt. Emmons), whose height is 3,595 feet. Notwithstanding its inferior altitude, being comparatively isolated, its position makes it favorable for observations.

"For general description, we may say that the long axis of the mountain is about three miles east and west, while its base transversely is narrow, so that the slope of the sides is steep, and in many places precipitous walls of rock, scarcely concealed by a sparse growth of evergreens. The outline of the mountain is irregular, the higher part consisting of two rounded peaks, separated by a sharp sag, the eastern peak being the higher. These peaks are traversed by gorges, which, being concealed by trees, are not distinctly seen at a distance. The north side rises from a level forest which separates the base from the Saranac Lakes and river. The south side is made up of parallel ridges, through which the sources of Coldbrook flow eastward, and from this valley other mountains rise abruptly, over which are seen still others in close proximity as far as the eye can reach. At the foot of the western half of Ampersand, south, lies the solitary and picturesque Ampersand Pond, so named from some resemblance to this alphabetic character. On the eastern shore of this pond are the remains of the 'Philosopher's Camp,' a log hut erected many years ago for Agassiz, Lowell, Holmes, and others. This spot is sufficiently retired, being five miles in the deep woods, and ten from a base of supplies. It is a gloomy place, and we are not surprised that 'philosophers' of their stamp forsook it for more genial associations.

"From the Valley of Ampersand Pond outlet, running west, and another valley intersecting it running south, rises the majestic Mount Seward, which, with its three grand peaks, is thus visible from crown to base.

"On the north side of Ampersand the lumberman has pushed his way as far as his labor could be made available or profitable. Beyond this the line of the trapper may be seen, while the deer hunter has followed his game still higher along the base of the mountain. But above this there is no evidence that the foot of man had ever trod. In olden times it was ranged by the moose, whence its former name of Moose Mountain, and later the panther and the beaver have enjoyed its rocky recesses undisturbed.

"At Bartlett's 'Sportsman's Home,' between the Upper Saranac and Round Lakes, the mountain is a prominent object. One never tires of watching the contrast, in varying lights, of the dark evergreen with the hardwood foliage of the intervening hills. Here also, clouds and mist, blue haze, and the purple light of the setting sun, may be seen and enjoyed, although certainly not on so grand a scale as in some other parts of this mountain region.

"It is not strange that such an object, habitually seen during visits to the woods, should excite the desire to become more intimately acquainted with it, and with the prospect which might possibly be enjoyed from its summit. Accordingly, last year (1872), a preliminary exploration was made, which, in the time allotted to it, sufficed only to reveal the precipices in the line of the route then selected.

On further consultation with an experienced woodsman, it was determined to make another trial on the opposite side, from near the site of the Philosopher's Camp. This consumed two days, and was rewarded with the discovery of the highest peak, a flat-topped cone, having a surface twenty feet wide and thirty in length, from which the view on both sides was found to be of great extent and interest. Postponing further explorations, for want of time, until the present year, on the 31st of July we ascended the mountain again by the old southern trail, reaching the top at six o'clock P. M. We slept on the summit without shelter, the wind howling wildly over our heads, while drizzling rain towards evening, with a dense fog, seemed as if intended to discourage our efforts. As this visit, however, was intended chiefly to open a path down the north side of the mountain to Round Lake, so that the extended circuit of the southern ascent and its difficulties might be avoided, the unfavorable state of the atmosphere was a hindrance only to sight-seeing. Having previously determined on the course, the path was selected with the aid of the compass, while our men blazed the line and cut out the obstructions. As we were seven hours in making this trail, it may be inferred that it was thoroughly done—two hours now being sufficient for the descent. The trail scarcely deviates from a northwesterly course coming down. It is free from precipices or difficulties of any kind, except those incident to forest paths and steep ascents. It is two miles distant from Bartlett's, and may be reached by boat in half an hour. The mountain may be ascended in three or four hours, returning the same day, or the night may now be spent comfortably on the summit.

"Meeting my friend Dr. William Read of Boston, on the 12th of August, on his return from camping, I informed him what had been done, and of my purpose to clear off the top of the mountain, and erect a shanty for the use of visitors, &c. He at once expressed a desire to join me in the enterprise. We started accordingly on the morning of the 13th, with three men, and pack baskets with blankets, provisions, &c., and reached the top after noon. The day was consumed in building our shanty of logs and bark, which at nine A. M. was in a condition to protect us in case of storm. The next day our Tip Top House was completed, being nicely covered with bark, the chinks filled with moss, so that it subsequently proved a perfect defense against rain. Being nine feet long, with an open front and southeastern outlook, a party of six will find it very comfortable, and, for the woods, an elegant structure of its kind. Our blazing fire at night was seen at different and distant points, and was signalled at Bartlett's by volleys of fire-arms and other demonstrations which the distance prevented us from noticing. Our stalwart and obliging men were now set to work with their axes in all directions—on the edge of precipices, in deep gorges, anywhere—as trees interfered with the prospect. We spent three nights on the mountain, and three days at this work, returning at the close of the fourth day.

"I may here note that on the second day (14th), a well-known gentleman from Boston, and his daughter, made us a visit. We were happy to welcome the first lady to the top of our mountain and the shelter of our shanty. They expressed themselves delighted in the highest degree with the outlook. After finishing our clearing we had an extended horizon, losing only the portions lying in the axis of the mountain east and west. The views on the north and the south sides are entirely different in character. On the south, Ampersand Pond and the whole of Long Lake are the chief visible waters, while innumerable mountains of the loftiest class are seen in all directions, as Seward, Sandanona, Emmons, McIntyre, and other mountains in Keene and North Elba. It is mountains, mountains everywhere. On the north side there is more of the picturesque. In a semi-circle, with a horizon twenty-five miles distant, are also mountains without number, and a vast spread of forest, with lakes and ponds, of which not less than thirty are seen in different directions. Here we look down upon the beautiful valley of the Saranac river, with its hamlets and ponds, down to Franklin Falls; the Lower Saranac and Round Lakes, with all their islands and tributaries; the Upper Saranac Lake also, with Cox's Hotel at the head and Bartlett's Settlement on the outlet, are distinctly visible. The lower half of Tupper's Lake, Mount Morris hiding its southern part, Raquette Pond and the farm buildings near it appear in the west. Big and Little Clear Ponds and St. Regis waters are visible. At the Lower St. Regis Paul Smith's is hidden by trees. Here and there in the forests we notice sparse settlements, and the isolated, solitary dwelling of backwoodsmen. Great swamps, with their sharply defined outlet of trees, look in the distance like farm clearings. Large fire slashes break the continuity of the green woods with their brown, dusky hues. Such a panorama, of which only some general points can be noticed, is well worth the time and labor spent in reaching the summit of Ampersand.

"The Adirondack wilderness, formerly visited by a few adventurous sportsmen, and almost unknown to the people of the State in which it lies, has, within a few years, become one of the most popular resorts for tourists. Hotel accommodations have been multiplied, but they are still scarcely adequate for the demands of visitors during the travelling season. Of the throngs who resort to the woods, but few can enjoy the pursuits of hunting and fishing. Besides, game no longer exists in its former abundance. Sporting must continue to afford less and less inducement to visit the wilderness, and must be superseded by new objects of interest—the climate, the peculiar local institutions, the boating, the rough and salutary exercises and exposures, and the unsurpassed natural scenery will remain. There will ever be wild passes to traverse, and rugged and difficult mountains to climb. The grand mountains of Essex, such as Dix, Marcy, McIntyre, Whiteface, are well known to the tourist. It is believed that the less lofty Ampersand is destined to attract attention as well as the old favorites, now that the way has been opened and the outlook has been tested and approved. The ascent of this mountain requires no deviation from the usual route through the Saranac waters. It may be made an incident of travel, involving but little delay, to those who are passing in or out of the wilderness in this direction.

W. W. E.
"Upper Saranac Lake, August 18th."

—On Gringley-on-the-Hill, in Yorkshire, England, a pair of three year old horses were bought about 1864. They have been worked ever since, and the distance they have travelled has considerably exceeded 30,000 miles. They have worn out six sets of carriage wheels, and are going along as merrily to-day as five year olds.

AN OLD SPORTSMAN OF THE SEVENTEENTH CENTURY.

IN the *Connoisseur* of 1755, there is a portrait of a brave old sportsman of the time of Charles the First. There is a truthfulness, a strength, a fidelity in the way it is rendered, that makes it a picture as vivid as if worked up by the pencil of a Wouvermans or a Terburg:

"In the year 1638 lived Mr. Hastings; by his quality, son, brother, and uncle to the Earls of Huntingdon. He was, peradventure, an original in our age; or rather the copy of an ancient nobility, in hunting, not in warlike times.

He was low, very strong, and very active; of a reddish flaxen hair. His clothes always green cloth, and never a worth, when new, five pound.

His house was perfectly of the old fashion, in the midst of a large park well stocked with deer; and near the house rabbits to serve his kitchen; many fish-ponds; great store of wood and timber; a bowling green in it, long but narrow, full of high ridges, it being never leveled since it was ploughed. They used round sand bowls; and it had a banquetting house like a stand, built in a tree.

He kept all manner of sport hounds, that ran buck, fox, hare, otter, and badger; and hawks, long and short winged. He had all sorts of nets for fish. He had a walk in the New Forest, and the manor of Christ-church. This last supplied him with red deer, sea, and river fish. And indeed all his neighbors' grounds and royalties were free to him, who bestowed all his time on these sports. He was very popular, always speaking kindly to the husband, father, or brothers of the manor on his estate, and the men were very welcome to his house; whenever they came they found beef, pudding, and small beer in great plenty. A house not so neatly kept as to shame him or his dirty shoes; the great hall strewn with marrowbones, full of hawks, perches, hounds, spaniels; and terriers; the upper side of the hall hung with fox skins of this and the last year's killing, here and there a polecat intermixed; game-keeper's and hunters' poles in great abundance.

The parlor was a large room, as properly furnished. On a great hearth, paved with brick, lay some terriers, and choicest hounds and spaniels. Seldom but two of the great chairs had litters of young cats in them, which were not to be disturbed; he having always three or four attending him at dinner; and a little white stick of fourteen inches lying by his trencher, that he might defend such meat as he had no mind part with to them. The windows, which were very large, served for places to lay his arrows, crossbows, stonebows, and other such like accoutrements. The corners of the room full of the best-chosen hunting hawk poles. An oyster table at the lower end, which was of constant use twice a day all the year round. For he never failed to eat oysters, before dinner and supper, through all seasons; the neighboring town of Pool supplied him with them.

The upper part of the room had two small tables and a desk, on the one side of which was a church Bible, and on the other the book of martyrs. On the tables were hawks-hoods, bells, and such like; two or three old green hats with their crowns thrust in so as to hold ten or a dozen eggs, which were of a pleasant kind of poultry he took much care of and fed himself. Tables, dice, cards, and boxes, were not wanting. In the holes of the desk were store of tobacco pipes that had been used.

On one side of this end of the room was the door of a closet wherein stood the strong beer and the wine; which never came thence but in single glasses; that being the rule of the house exactly observed. For he never exceeded in drink, or permitted it.

On the other side was the door into an old chapel, not used for devotion. The pulpit, as the safest place, was never wanting of a cold chine of beef, venison pasty, gammon of bacon, or great apple-pie with thick crust, extremely baked.

His table cost him not much, though it was good to eat at. His sports supplied all but beef and mutton, except Fridays, when he had the best salt-fish, as well as other fish, he could get; and was the day his neighbors of best quality most visited him. He never wanted a London pudding, and always sung it in with 'my part lies therein.' He drank a glass or two of wine at meals; very often syrup of gulliflower in his sack; and had always a tun glass, without feet, stood by him, holding a pint of small beer, which he often stirred with rosemary.

He lived to be a hundred; never lost his eyesight, but always wrote and read without spectacles; and got on horseback without help. Until fourscore he rode to the death of a stag as well as any."

A DEFENCE FOR SCIENTIFIC EDUCATION.—In speaking of scientific education, M. de Quatrefages, President of the French Association for the advancement of science, stated as follows:

"That the devotees of literature accused science of stifling sentiment and imagination; she kills, they say, the ideal and stunts intelligence by imprisoning it within the limits of reality; she is incompatible with poetry. The men who speak thus have never read Kepler the astronomer, Pascal the geometer, Linnæus the naturalist, Buffon the zoologist, Humboldt the universal savant. What! says the President, science stifles sentiment, imagination, she who brings us every hour into the presence of wonders! She lowers intelligence, who touches on all the infinities! When *litterateurs* and poets know science better, they will come and draw from her living fountain. Like Byron of our time, like Homer of yore, they will borrow from her striking imagery, descriptions whose grandeur will be doubled by their truth. Homer was a *savant* for his time. He knew the geography, the anatomy of his era; we find in his verses the names of islands and capes, technical terms like *selavicle* and *scapula*. None the less he wrote the *Iliad*."

The French aeronaut, Pointevin, took up, suspended from his balloon, a spirited horse. As soon as the animal was off the ground, he became as still as though he had been paralyzed, but when he came down and dragged slowly through a cornfield, he bit at the ears of corn, though in a peaceful manner. It is said that a horse, when off his feet, loses his viciousness and puts himself completely under the control of whoever has him in charge, whereupon it is suggested that an aeronaut voyage is a capital manner to tame vicious horses.

Darwin's missing lynx may be found in America.

Woodland, Lawn and Garden.

HEDGES AND THEIR USES.

No. V.—THE RED CEDAR, (*Juniperus Virginiana*).

"—Strength may wield the ponderous spade,
May turn the clod and wheel the compost mould—
But elegance, chief grace the garden shows,
And most attractive is the fair result
Of thought, the creature of a polished mind."

COWPER.

Years ago, the hedge question was considered among the *impracticals* of the time, something much to be desired, and was then in the years 1835 to 1840, but little known practically, in this country. True, some tolerably good specimens of hedges could be found, but they were of not much account otherwise than giving a clue or specimen of what might be accomplished in the making of the hedge row in later years.

When the subject of the evergreen hedge was brought to the attention of our farmers, particularly in the western country, for the first time, they encountered their disbelief if not direct opposition from those who should have been the very first to have encouraged and readily engaged in the planting of hedges, "in this new thing" entirely. One extensive land owner who was possessed of one of the finest grazing farms in the West, said "we did not know anything about what we were writing about, and if we ever had good tree hedges, we should have to go to the English gardener to produce them." We were led to a very close study of the whole subject of hedges; and much that is valuable in our after acquired knowledge, we frankly confess, was in a great measure owing to this severe rebuff from our old Pennsylvania farmer, with his strong predilection for everything European.

In our investigation of the hedge question at this period, we learned from conversation with men of the first intelligence, and consultations with the most practical English authors, that the idea of any other hedge than the English *hawthorn*, at that time could scarcely be tolerated. *Arbor vitæ* now so freely used, was not known as a hedge plant, scarcely at all. Even many attempts to make a good hawthorn hedge proved unsuccessful. This want of success in those early days, we think to have been owing more to neglect and the slovenly treatment accorded to the plant than any inherent quality or defect of the thorn plant; subsequent judicious treatment, having proved it to be easy of cultivation, and a good reliable hedge plant.

The cultivation then bestowed upon the hedge, was next to no cultivation at all; left almost entirely to itself after planting, no wonder the hedge row, once so trim and neat, became the "awful scraggly" and irregular, unsightly row of bushes of all heights; without order or beauty; an eyesore, an offence to every attribute of the beautiful.

An English hawthorn in those days even, was not considered as the pride of the village, the odoriferous sweet blossoming, neatly trimmed avenue of beauty that it became in after years, and of which we shall speak in its due place in our papers on hedges.*

We make these brief remarks upon the hawthorn, as an early, and one of the first hedge plants used in the towns of which we speak, before the days of our evergreens, a continuation to the use of the different kinds of which we now return.

As shelter from the regular cold currents of our winter months has become of so much importance to the husbandman, the agriculturist, florist, and ornamental gardener, we naturally look about for the plants best adapted for this purpose. There are, as we have already shown, several plants well adapted for this purpose, but the cheapest to use, to any extent, is common red cedar. (*Juniperus Virginiana*.) This well known plant is easily grown from the seed, which are produced abundantly, and if properly planted will be large enough for planting out in the hedge row in two years from the planting. By the third or fourth year being a hardy compact plant, it will by this time present quite a firm barrier, as well as a shelter hedge. This plant bears the "shears" or clipping remarkably well; as well as any one of the evergreen hedge plants we have used. Its tendency being of an uniform upright growth, we have seen it growing remarkably well, with but little or no attention at all. It will under any ordinary circumstances make a compact evergreen wall of protection, sending out its evergreen branches even from the very ground. Any one who has carefully noticed the upright, hardy tendency of this red cedar plant, will have observed it to be a remarkably clean and compact growing tree in its natural woods and forests. It should be more extensively used than it has been, for it is a long liver, and one of the best plants that can be used for an outside fence, where cheapness and durability are the chief questions under consideration. The red cedar is found in many portions of our country, and it readily springs up from the berry even in the most arid and unpromising situations. The birds plant a great many trees, and of this cedar berry, they are truly the great planters. We have seen acres of this beautiful tree at all heights and sizes running up like a perfect cone, green, and beautiful to behold, and always commanding our especial attention. From Maine, throughout Massachusetts, all along the Hudson, and on Long Island, may be seen this hardy plant growing profusely, and scattered over a vast extent of field and past-

ure land, as though inviting every thrifty well informed yeoman to make at least one experiment in the cultivation of this valuable adjunct of civilization.

Every one has seen or heard of what in some portions of Long Island, are called "lop fences," made originally in this manner: It being desirable to apportion off a certain portion of the lands, either for pasturage, clearing, or tillage, a row of small trees of white and red oak, sometimes the "scrub oak," was pressed into service and made to do duty as live posts for our line fences. Then the operator with his axe commenced to trim along the side of his future fence, the short undergrowth of shrubs, whortle-bushes, and undergrowth of plants, reserving the small trees of white oak, which were at this stage about the size of hoop poles, for his "lop fence." These latter were then by a slight blow of the axe on one side partially severed, and the top of the sapling bent over about two feet from the ground and tied down in a longitudinal manner, with withes to keep them in position. Aided by a few stakes as further support, the primitive outline of the "lop fence" was initiated. This "lop fence" in after years being the resort of birds of various kinds, who deposited the seeds of the numerous kinds of trees upon which they fed, planted the same along the line of the fence,† a large portion of their favorite feeding ground being the red cedar groves and cherry trees of Long Island. Soon our fence became the resting place of the feathered planters, who deposited the seed with a liberal bill the whole length of the "lop fence" line.

Having used to a considerable extent the red cedar, and from careful observation of the growth of this hedge plant in different sections, of our country, we have no hesitation in saying that as a protection, nothing in the nature of an enclosing, strong, permanent hedge, is found superior to the red cedar hedge when rightly planted. Mr. reynard or rabbit, cannot get through this impenetrable, smoothly trimmed green; the field mouse can scarcely find a shelter within it; nor will ox, cow, or horses get through it. Hens and turkeys, those pests, often, of the farm-yard, try it once or twice, and leave it after a few vain attempts to penetrate it, as something they cannot understand.

For a winter screen, this kind of hedge is the *sine qua non*, you can make it compact as you please by sowing the seeds thickly along the row, and then thinning to a desired distance apart. As they grow very straight you have only to keep your eye upon them to have a perfect straight evergreen, true hedge. The element of shelter from the wind is soon obtained from this hedge, and who does not know from experience, how comfortable he feels, on a cold, raw November day, to seek the sunny side of just such a screen.

And then again the long undulating line of beauty to be found in such a well kept hedge is charming. Imagine such a hedge as this upon an uneven surface of landscape, as it rises and falls with hill and vale, in easy natural curves,

"Nature assuming a more lovely face,
Borrowing a beauty from the works of grace."

Really there is grace and beauty in the sturdy old hedge, as well as plant power of resistance to the elements, or the encroachments of bird and beast. Then when we add the ornamental elements of beauty and attractiveness, always found in variety around us, we feel a new love of the beautiful within us, if not a desire to make all men appreciate in some higher degree than before, the loveliness of this glorious world that God has called into existence for the pleasure of man.

OLLIPOD QUILL.

*We merely introduce the natural "bird fence," or "lop fence" in this place as an illustration of the hardy, tenacious character of the red cedar as a hedge plant. Many very interesting and highly instructive facts, relating to this kind of fence, and all particulars relating to the same, together with curious and amusing incidents connected with it, will make the subject of a separate paper, upon "lop fences" and their use in a future number of FOREST AND STREAM.

The Magazines.

PERSIAN MANNERS.

The natives of Persia do not recline on cushions, in the luxurious manner of the Turks; but in an erect posture, on thick felt called a *numud*. They have seldom, if ever, fires in their apartments, even in the coldest season, and in order to keep warm, fold themselves in a fur pelisse or a *barounee*, which is a handsome robe of crimson cloth, lined with shawls or velvet. Like other Oriental nations they rise with the sun, and having dressed and said their prayers take a cup of coffee, or perhaps a pipe. They then enter upon the business of the day, if they have any; and, if not, smoke and converse until about eleven o'clock, at which time they usually have breakfast, and then retire into the harem. There they remain until about three o'clock; when they retire to the hall, see company, and finish their business; for with these people the most important affairs are discussed and transacted in public. Between nine and ten the dinner, or the principal meal, is served up. This chiefly consists of *pilavies*, and of mutton and fowl, dressed in various ways, of which, however, they eat but moderately. Wine they never taste before company, although in private they are the most notorious drunkards, and invariably drink before they eat. They are passionately fond of tobacco, which they smoke almost incessantly from the moment they rise until it is time for them to retire to rest; it constitutes, indeed, the principal source of amusement to a man of fortune; and were it not for his *calcan*, I am at a loss to imagine how he would spend his time. In this respect, indeed, there seems to be something peculiarly inconsistent in the character of the Persians. When without an inducement to exertion, he resigns himself entirely to luxury and ease; and the same person, who with his *calcan* in his mouth, would appear to pass the day in a sort of stupor, when roused into action and mounted upon his

horse, will ride for days and nights without intermission. Hunting and hawking, as well as various gymnastic exercises, are favorite amusements of the Persians. By these means their bodies become hardened and active, and as they are taught to ride from their youth, they manage their horses with great boldness and address. They frequently use the warm bath, but seldom change their linen. They are as bold and daring horsemen as I have seen, and delight in showing off their dexterity. One of their great amusements is shooting from horseback, and they show wonderful skill in thus bringing down ground game at full gallop. This is most remarkable, as they have no idea of shooting at a bird on the wing: indeed never attempt it, but wait until they can get a shot on the ground. They are excessively fond of horses, and, although unsparing of their powers in the field, take much care of them in the stable, where, strange to say, a pig is often kept for their protection, on the supposition that should an evil spirit pass the threshold it will take up its quarters in the soul of a beast so loathsome to the nostrils of a true son of the Prophet, and leave the horse unmolested. Much faith is likewise laid in the efficacy of charms, and the favorite animal of the stable has generally a turquoise, which is held to bring luck, strung to his tail. Oats and hay being almost unknown, the horses are fed on barley and chopped straw, and a course of green fodder in the spring.

LE ROI S'AMUSE.

That his sacred majesty of Persia must be somewhat of a wag is evidenced by the following account of one or two illustrations of his love of practical joking. The Shah had invited some Europeans to breakfast and display their skill in skating at one of his country palaces. "His Majesty, surrounded by his court and some of his ministers, stately long-bearded gentlemen, in flowing robes and tall hats, took much interest in it, and highly applauded the performances of the two English engineers in his service. After a time, however, his interest flagged, and urged no doubt by the *espieglerie* inherent in the character of all Persians, he expressed a wish to see his courtiers try their feet on the ice. . . . The dignitaries of the court cast deprecating looks at their sovereign when his wish was made known to them. But the more reluctance they showed, the more the idea seemed to tickle his majesty, and the more he insisted: so the skates were attached to their feet, and they were carried on the ice. I refrain from attempting a description of the scene that ensued; its counterpart might perhaps be imagined by conceiving several Lord Chancellors in their state robes taking their first skating lesson on Virginia Water.

The other incident occurred not long after.

The Shah took such a fancy to a portable inda-rubber boat, that its owner, one of our officers, who had got it from England with a view to explore some of our rivers, begged, and of course obtained, permission to present it to him. It was at once transported to the palace, and, when inflated, my friend had the honor of paddling royalty about on one of the tanks. The amusement pleased his majesty, and he took to paddling himself; the courtiers followed suit and eventually the King caused a throne to be erected near the bank, in order that he might be at his ease to watch their progress in their new accomplishment. It was probably too slow to afford him satisfaction, for one day he announced that he should like to see how many persons his boat was capable of carrying. Three could sit comfortably in it, but there was room for a dozen, and accordingly a dozen A. D. C.'s and chamberlains, in their handsome shawl dresses and gold brocades, stepped in. Meanwhile, some one in the royal confidence had secretly opened the valves. The boat was shoved off toward the middle of the tank, and as the air escaped, gradually sank lower and lower, and finally disappeared with its gorgeous unsuspecting freight in the water. In a moment there was nothing visible on the surface of the tank but lamb's-wool hats and linen skull caps; for a moment, too, there was silence. Then a dozen shaven heads were seen wagging their tufts and sidelocks, and a dozen mouths and noses were heard puffing, blowing and snorting as the owners struggled slowly to the side. The Shah laughed long and loudly, and was so much pleased with the success of the stratagem, that when his victims emerged, all dripping and crestfallen, before him, he deigned to inquire, what news of the fish? Persians can take a joke as it is meant; and though no doubt the courtiers wished the boat and the donor a speedy descent to the warmer climate, I dare say they all afterward joined in their sovereign's laughter.—*Mounsey's Persia*.

THE FLIGHT OF THE EAGLE.—It is some fourteen or fifteen years since I first watched an eagle through a telescope.

Not to go back too far, as I must trust to memory, I was two or three years ago, on the summit of a long-backed solitary hill, 500 or 600 feet high, in the Coimbatore plains of Southern India. There was a light breeze blowing, and I saw an eagle stemming it, on the leeward side of the hill, which was steep. Sometimes he was within (say) fifty yards, and having a good glass at hand, I rested it on a stone heap, and watched him. It was frequently possible to see him thus, stationary in a motionless field of view, at an apparent distance of ten or twelve feet. Not a feather quivered: the head was turned from side to side as he scrutinized the hill-side; occasionally a foot was brought up to the beak: the roll of the eye was perceptible: but otherwise he was at rest to all appearance. They may have been quivering, but they looked as steady as those of a stuffed specimen. And here I may observe, that for this appearance to be compatible with an unperceived vibration, the position of rest must have existed alternately with successive excursions, and the time occupied by the latter must have been insignificant as compared with the duration of rest. I find it impossible to accept this explanation, even as a first step, and need not inquire how it would produce the supporting effects. The tail, I should mention, was not at rest. It was frequently feeling, as it were, the passing breeze.

It is to be understood that in the course of the frequent changes of general position, I had the bird under examination from different directions—not always of course so favorably.—*J. Herschel, in Nature*.

—Storm signals are raised on the citadel at Halifax, when notice is given by the Dominion Meteorological Bureau.

—Isn't the sea-serpent likely to prove a boa?

—Was the can-can co-existent with the do-do!

*There are now in the United States many miles of this kind of hedge, and they have stood the climate well, particularly in Ohio, Indiana, and Illinois.

Natural History.

THE GURNARD AS AN EDIBLE FISH.

AMONG the fish that may be classed as edible, but which are entirely neglected here, is the *Sea Robin*, *grunter*, or *gurnard*. This curious, but rather forbidding creature, is, in reality, one of the most delicate morsels that can be laid before an epicure, the flesh being snow-white, firm, and fully as good as that of the *king-fish* or *whiting*. In fact, it would be hard to distinguish them when placed on the table.

In Europe every one of the various kinds of *Trigla*, or gurnard family, is sought after eagerly, and finds a ready sale on the fish-stalls. They have eight or ten kinds of the group there, and we have but six here, all but one different from the European kinds, though belonging to the same family. We shall not attempt to describe all these fish, which resemble each other very much in all but the color. They all have large heads, sheathed with rough, bony plates, and armed with many acute points, and their dorsal fin has also several sharp, thorny rays. These prickles are all erected by the fish when taken alive, and they inflict painful, though not, as many say, a poisonous wound. The broad mouth is furnished with rough, but not sharp teeth, the pectoral fins in most of the species are very long, and can be expanded like a fan, whence they are sometimes called *flying-fish* and *butterfly fish*. It is doubtful, however, whether they can actually fly like a flying-fish; but they have been said to skip from wave to wave, a peculiarity often alluded to by *habientie* poets.

They also emit a grunting sound, which can be distinctly heard in still weather while lying at anchor on a shallow, which they frequent. At such a time the sound resembles the distant lowing of kine. When freshly taken from the water they grunt quite loudly, whence their popular name of *grunter* or *cuckoo fish*.

The gurnards live on crabs and delicate fresh food, taking all such baits readily, on a clean bottom, and they sometimes annoy fishermen hugely by their voracity. They play well on the hook, and a large one tugging at a rod is often supposed to be a game fish and a prize, till the ugly sea robin, with his spiky helmet, shows himself at the surface.

The gurnards of our coasts do not reach a large size, at least we have but rarely seen any that weighed over a pound, while in Europe some of the species, such as the Tub fish (*Trigla hirundo*) has been found, weighing eleven pounds, and those of seven or eight are common. The red gurnard or rochet (*T. cuculus*) and the piper (*T. lyra*) reach three or four pounds, averaging about two, while the other European kinds resemble ours as to size.

Small as our species are, they are not the less delicate when cooked, and we have often verified this fact.

They are sold in England by the number, and not by weight, for their large heads are inedible, while they add, perhaps, one-quarter to their weight.

The English fishermen take them almost everywhere along the coast in large trawl nets, constructed for their capture, though other bottom fish may find their way into the net. These trawls are generally twelve or sixteen feet wide at the mouth, with a bag proportioned to their beam, which has one or two labyrinths like a fyke net inside. The trawl is managed from a large sail-boat with a block and tackle, and is hauled in water as deep as eight or ten fathoms.

We do not recommend this special fishery to our coast fishermen, as our gurnards are small; but wish only to call attention to the edible qualities of this generally despised fish.

Piscator (the anonymous author of the *Practical Angler*), in his excellent little treatise, entitled "Fish; How to Choose and How to Dress," published in 1843, says of the gurnard, that their flesh is "white, exceedingly firm, and shells out into snowy flakes, and is of a remarkably agreeable flavor, and that they keep well." He recommends them to be boiled—that is, the large ones—while the small ones may be split and fried.

We have no popular names for each of the species that are found in our waters. All are called *sea robins*, *flying-fish*, *grunters*, &c.

The *Trigla cuculus* is the only one of the genus enumerated by Professor Theodore Gill, in his catalogue of the "Fishes of the Eastern Coast of North America, &c." This one may be the same as the European species, but a closer comparison of them is needed before this can be affirmed. This is the true *sea robin*, being the only one that is red like its feathery and distant relative. The other species of *Trigla* named in the above catalogue belong to the genus *Prionotus*, but the distinction is a slight one. Of these Gill names five species, which it would be useless to quote here.

Having drawn attention to this first as one that deserves a place on our tables, we leave his fate hereafter to the tender care of a good cook and a discerning palate.

J. C. BREVOORT.

THE SEAL A GOURMAND.—If the sense of smell is exceedingly acute in the seal his taste for food may be judged by the keenness with which he relishes his food. "The mouth of the greatest gourmand," says Cuvier, "never waters more at the prospect of a rich repast than of the seal when in expectation of its common sustenance. A copious saliva fills and flows from its mouth during deglutition, and not less so the moment the seal perceives its prey."

FISH PROTECTION IN CHINA.—What a good people the Chinese are. If they do roast a missionary occasionally, they preserve the fish laws. Let us have some mandarins at the head of our Fish Commissions. Listen to the worthy actions of the Chinese in regard to fish:—

Some 1222 years before the christian era, an Emperor of China had expressed a desire to go a-fishing with his consort. It was then the fourth moon—the spawning season. One of his chief ministers, rejoicing in the name of Tehangsyne, threw himself on his knees before his majesty, and showed him that by carrying out his proposal he would violate one of the most important laws of the kingdom, and would have heavy accounts to render to history for setting the example which might cause the ruin of the public resources of food in the shape of fish. "You are right," answered the emperor; "he to whom heaven has confided the Government of a people must conform to the laws of the country and watch over the interests of his subjects, otherwise he is not fit to reign." Another emperor had set out fishing once during the close time in one of the ponds belonging to the place, when one of his councillors, named Lyke, came quietly up and cut the net in pieces before his astonished sovereign's eyes, explaining, in answer to the imperial threats and angry demands for his reason for so acting, that he was merely fulfilling the duties imposed on him by the law. This brave minister, we need hardly add, was, of course, richly rewarded by the erring but repentant emperor.

SNAKES SWALLOWING THEIR YOUNG.—A correspondent of the *New York Tribune*, writes as follows:

When about twelve years of age, I met a small snake about two feet long, on a dusty road in Central New York, whose singular motions at my approach attracted my attention. When within a few feet of it, I discovered four little ones, five or six inches long, hurrying towards the large one, and one by one disappearing in its widely opened jaws. The old snake then attempted escape, running toward the side of the road, by which ran a small brook. My curiosity being excited, I killed the reptile, and cutting it open found the little ones coiled up in some kind of cavity, (I cannot say what, for at that age few boys have much idea of anatomy.) The little fellows being thus rudely turned out attempted to effect a hasty escape. I am not certain whether it was an ordinary striped or a water snake.

—The Hon. Thomas James Bernard, member of the Council, has related to me a very curious fact of the yellow snake. Lately his laborers in the Pedro mountain district, St. Ann's, killed a yellow snake containing some ten or twelve grown young ones varying from eight to ten inches in length. The negroes expressed their surprise at this circumstance, because they knew that this boa produced its young from eggs. A phenomenon like this was well calculated to call forth from negroes their usual 'golly' of surprise, but it should have excited in intelligent observers and professional naturalists some other idea than that snakes have a 'local option' in bringing forth their young, by eggs hatched in the ground, or by incubation, or by 'bearing them alive.' Mr. Hill timidly ventures the remark, 'Is this to be received as a case of snakes that retire upon alarm into the mouth and stomach of the parent?' It is stated of the rattlesnake in "Hunter's Memoirs of a Captivity among the North American Indians," that, when alarmed, the young ones, which are generally eight or ten in number, retreat into the mouth of the parent, and reappear on its giving a contractile muscular token that the danger is past. Credible eye-witnesses say the same of the European viper. (See Charlesworth's *Mag. Nat. His.*, Vol. I., new series, 1837, p. 441.)

KATONAH, WESTCHESTER CO., September 11, 1873.

EDITOR FOREST AND STREAM:—

Yesterday, when walking through my fields, I was attracted by the vigorous barking of my dog, and noticed that a huge frog was exciting his ire. Calling the dog off I secured the frog, and taking it by the leg, was about carrying it to a pond in the place, when I observed something hanging from his mouth. Taking what seemed to me to be the tail of some creature, between my fingers, from out of his mouth, I extracted a very large field mouse, fully three inches long. I was not before aware that frogs would prey on mice.

Seeing Professor Goode Brown's inquiries in regard to snakes swallowing their young, I beg to add that, two years ago, while picking berries, I observed a black snake, fully four feet long, near me, which on my approach made for the bushes. With a stick in one hand, the other engaged in picking berries, I kept on at my occupation, when suddenly the snake made a dash at me. Expecting an attack, I struck at her as she sprung, and with a blow of my stick, almost cut her in two. Imagine my surprise when I saw five or six small snakes, about as large as rye straws, inside of her. They presently emerged from the body of the snake, and took to the grass. I killed two, but the rest being quietly, escaped.

Yours truly,

J. W. A.

—A new and important fact in silk culture has been developed by the Acclimation Society of France, namely: That silk of varied color can be produced by feeding the silkworm on different leaves. Worms fed on vine leaves produce a silk of magnificent red color. Lettuce has been found to produce an emerald-green colored silk. Of course, then, if fed on the leaves of the indigo plant the product would be indigo blue.

—A farmer in Washington county, Ky., has found a practical use for a snake. For two years he has had one shut up in his corn-crib, and during all that time not a live mouse has been seen there.

—A man in Fayette county, Pa., while gathering blackberries, heard a rattlesnake's peculiar note of warning, and looked around on all sides before discovering that he was standing with both feet on the reptile, but so close to its head that it could not bite him.

—In Ireland, with less than 5,400,000 inhabitants, the two shillings licence duty was paid in 1872 on 290,796 dogs. The British government will not object to the continuance of this grievous tale so long as the Treasury is benefitted by this tax on a nation of wags.

—Lester B. Platt, a Yale divinity student, who has been spending his vacation on the western plains, accepted an invitation to hunt with the Pawnees, and was with them when they were attacked by the Sioux recently on the plains and so many of them slaughtered. Platt fought bravely, but was captured. He wore the Pawnee dress, and would have been scalped, but the Sioux chief forbade it, and, pointing to the Republican river, bade him run for his life. He did, and saved it.

The Kennel.

THE FOX-HOUND.—The fox-hound, of all dogs used in the field, is by far the most numerous. It is generally supposed that the modern fox-hound derives its origin from the old English hound, and its various points of perfection from judicious crosses with other breeds. There are various breeds of dogs which are remarkable for the great development of some peculiar faculty—such as speed in the greyhound, courage in the bull-dog, delicacy of scent in the bloodhound, sagacity in the poodle, &c., so when a breed of dogs begins to fail in any of these points the fault is amended by the introduction of a dog belonging to the breed which exhibits the needful quality in greatest perfection. The fox-hound has not only the greatest sagacity and the most refined powers of scrutiny, but is far superior in bottom and stoutness to any other breed of the hound race. Only consider the immense distance a hound travels over during the many hours that he is frequently absent from home. The country he travels over is generally of the very roughest description, such as sharp rocks, scrub-oak, brambles, &c., and he frequently takes to the water. For the authenticity of the following anecdote we think we may safely vouch:—"Mr. Phillips, of Bergen Point, has a singularly fine old dog. He had been hunting with a friend of his in New Jersey, and the hound had been running a dog-fox nearly all day, when at last the hound turned him toward water; the varmint, instead of taking to water, however, ran up a branch of an old dead tree that was overhanging the stream, the hound waiting a second or two as if undetermined what to do. In an instant he jumped on the but of the tree, and, walking up carefully, the limb snapped, and both fox and dog fell into the water. Now came the struggle for life. The hound rose to the surface first, and immediately espied the fox, who was swimming for dear life to the other side; the hound turned on the fox, both going down together. The hound again rose first to the surface, and once more, making a kind of leap in the water, seized the fox by the back of the neck, and held him there until he had absolutely drowned him, and then swam ashore, bringing the dead fox with him, to the utter astonishment of Mr. Phillips and his friend, who witnessed this curious scene from the shore." The best breed for fox-shooting is the English fox-hound, crossed with the American hound. The English-bred hound is too delicate. The ground you ride over and the ground you shoot over are totally different. The English dog is too finely bred to suit our rocky ground; its pace is too fast, as, unless it runs in the open, it is apt to overrun the scent. A dog running at thirty miles an hour cannot be expected to hold the scent as strongly as one running at fifteen miles an hour. The speed which can be attained by fox-hounds may be estimated from the well-known match which took place upon the Beacon course at Newmarket, England. The length of the course is four miles and 352 yards, and this distance was run by the winning dog, Bluecap, in eight minutes and a few seconds. The famous racehorse Flying Childers, in running over the same ground, was little more than half a minute ahead of the hound. Now, if we compare the dimensions of the horse and the hound we shall form a tolerably accurate idea of the extraordinary speed to which the latter animal can attain. In the match no less than sixty horses started, together with the competitors, but of the sixty only twelve were with the dogs at the end of this short run. The English hound is of the utmost importance to our fox-shooting friends, as what they require in a hound is a good nose, hard feet, padded with a thick sole, strong propelling powers behind, and more endurance than excessive speed, not forgetting a musical tongue, which can only be attained by the cross of the American hound with the English. As there has been so much breeding "in-and-in," and very little fresh stock imported, the fox-hound is sadly deteriorating, as we only hear of a few instances of fresh blood. In the South they have some splendid new blood, which they have crossed with the southern fox-hound, and have produced the perfection of a hound for their purposes. The best breeds of fox-hounds in the North are owned in Buffalo; Guernsey county, Ohio; Mr. Taylor's Connecticut farm; the Leatherstocking Club, of Oswego; and the Blooming Grove Park Association. The latter have two bitches, crossed by a Connecticut dog, and the whelps, if properly trained, will undoubtedly come as near perfection as possible.

—There is a knowing dog (and a "yaller" one at that) in Washington who complies with the letter, but not exactly with the spirit, of the law in relation to muzzling canines during the dog days. He is never without a muzzle, but instead of wearing it strapped over his nose, as other dogs do, he carries it in his mouth, and is never seen on the street without it. When he halts to rest he drops it between his fore legs, but whenever he starts he picks it up and jogs along quietly, looking as if he would say to all policemen, "I am a law-abiding Tray; as you see, I have a muzzle; so please don't molest me." When he is at home he deposits his muzzle in his kennel, but whenever he is going out walking with his master or any of the family he goes regularly and gets his muzzle, and it is never necessary to remind him of it. Smart dog that. He is a good-natured old fellow, too, and doesn't bark like Kelly's now famous cur. He don't belong to that breed of dogs.—*Washington Star*.

—We weighed a day or so ago a puppy, twelve weeks old, a cross between a mastiff and a Pomeranian dog, and he turned the scales at fifty-two pounds. We think this weight is hard to beat.

The Horse and the Course.

TROTTING-GAITS.

RUNNING is undoubtedly the horse's natural gait, as it is his swiftest, but for carriage driving, and for the thousand and one business purposes for which the horse is used, trotting horses are far superior, and running horses almost useless. Probably this fact first brought the trotting horse into such universal favor, for, before the use of carriages became general, the gait was almost unknown. Since their introduction, however, it has become the universal gait, so much so, in fact, that even on the race-course it predominates, and a majority of the fall meetings in this country are devoted to trotting matches, with occasional running matches sandwiched in between, just for the excitement of the thing. Besides these two distinct gaits, there are several modifications, to some one of which occasional horses are addicted. Thus Pocahontas, one of the fastest horses this country has ever produced, was a pacer—that is, stepped with fore and hind foot on the same side together, or, as old horsemen generally say, “stepped all on one side.” Other nags have a habit of swinging their feet in and out, or racking, giving their bodies a motion something like that of a ship in a heavy swell. Others still have a mixed gait. Some trot squarely with their fore feet and run behind. Others have an uneven step, half way between a trot and a run, the legs neither moving together nor shooting out together at exact intervals. Of this latter class was Flora Temple, who trotted a mile in 2:19½, when tracks were some seconds slower than they are now. All of these gaits, however, are simply imperfect approximations to the trot, the ideal of which is an alternate, accurately-timed stepping; the body swaying neither to the right nor the left, and with the least possible motion up and down. This latter motion is one of the most common faults of the trotting horse, and, when an animal is free from it, he is said to “trot level.” Another common failing is a dragging of the hind legs, especially noticeable when the trotting horse begins to tire. As running is the natural gait, most horses take to it without difficulty, and the main differences in the gait are in the length and rapidity of the stride. Most of the great trotters began their trotting education after they were well matured. The record of these best animals also goes to show that, so long as they are sound and their joints limber, they have continued to improve with age, and have done their best work between the ages of ten and fifteen, and generally after they were twelve years old. The cause of this is twofold, and is found in the fact already stated, that the trot is a forced gait, and therefore always susceptible of improvement; and in the other fact that the trotting muscles harden with age and get that steely quality that never tires, and enables the horse to hold his gait through the number of heats needed to win a race.—*Springfield Republican.*

HOW THEY CATCH MUSTANGS.

The editor of the Pleasanton *Stock Journal* gives the *modus operandi* of capturing wild horses in Texas, which will no doubt prove instructive to many. It will be perceived that all the popular notions in which the lasso and fleet-footed charger play an important part, have little foundation in reality.

As soon as a herd of horses is discovered, the party of hunters divide, one portion striking camp, while the other sets off in pursuit of the herd. The frightened animals go bounding across the prairie through the prickly pear and dense chapparrel, leaving a trail which the hunters steadily pursue at an easy gait until they come in sight of the herd, which scampers off as before. These tactics are kept up by pursuers and pursued for days, the mustangs returning to their first starting-point—which they are sure to do—when the camping party takes the place of the tired pursuers and thus follow the herd, until the poor, wearied, half-starved creatures, with swollen and bloodshot eyes, give up the struggle and submit to be driven anywhere. The object of the hunters has been merely to keep close enough to the mustangs to prevent them grazing. Starvation soon brings them to terms, and the prairie monarch, with drooping crest and dejected look, leaves his native wilds henceforth to become the slave of man. That is what hunters call “walking mustangs down.”

A remarkable trotting match took place at Point Breeze Park, Philadelphia, on Thursday last, between Mr. John Miller's bay mare Dollie, and William Kendall's handsome bay horse Spot. The former gentleman's horse was driven by Mr. Scofield, to a light sulky, while Mr. Kendall drove his horse to a Germantown wagon, containing four persons, \$200 having been staked by the latter gentleman against Mr. Miller's \$100. The contest was won by Spot, who is a very large and powerful animal, by about six lengths, completing the distance, one mile, in 3:30, which, considering the great weight he had, must be regarded as very astonishing time. A number of prominent gentlemen were spectators of the race, and were greatly surprised at the result. No similar instance is on record in the world.

A sale of fine horses took place last week at the farm of George C. Hitchcock, Esq., New Preston, Connecticut, conducted by Colonel Barker, of the New York “Tattersals.” There was a fair sprinkling of New Yorkers, notably among them “Hark Comstock” and Clarence C. Collins. Mr. Collins bought a pair of geldings for \$600. The amount received for twenty-eight horses was \$10,795. The highest price obtained was \$1,500 for Highland Queen. The lowest \$100, for Highland Maid. The average, \$385 53.

In the last seven months the number of horses exported from England was 1,320, of which 543 went to France. The value was £77,025. In the same period last year the number was 1,888, and the value £104,913. In seven months of 1871 as many as 4,104 horses were exported to France.

FLEETWOOD PARK, September 15.—Sweepstakes \$500; mile heats best 3 in 5, to wagon; owners to drive.

W. Johnson's b. g. Bay Dan.....	2	1	1	2	1
W. Lynch's b. g. Billy Lynch.....	1	2	2	1	2
P. Daley's br. g. Tony Hartman.....	3	3	dist.		
O. Murphy's b. s. May Morn.....	4	4	dist.		
J. Millane's b. g. Bay John.....	Drawn.				

Time—2:57½, 2:52½, 2:50, 2:50, 2:51½.

SECOND RACE—Sweepstakes \$500; mile heats, best 3 in 5, to wagon; owners to drive.

O. Murphy's b. g. Tassy Torney.....	1	1	1
M. Ryan's b. m. Belle Jones.....	2	2	2
J. Ryan's s. m. Lady Ryan.....	Drawn.		

Time—3:04, 3:00, 2:56½.

The regular fall meeting of the Fleetwood Association began on the 15th. The premiums are liberal, and the entries embrace some of the best blood of the trotting horses of the country.

Robert Bonner's famous stallion Startle again appeared on the track September 13th, and trotted three-quarters of a mile in 1:43, which is the fastest time ever made on the track.

WHITE PLAINS, N. Y., September 15th.—The unfinished trotting race of September 13th, for a purse of \$500 for horses that had never beaten three minutes, best 3 in 5, was completed to-day. At the time of postponement eight heats had been trotted, and three more were required to arrive at a result. Eleven heats in a race of this character is very remarkable. Ben Wilson's brown mare Carrie at last proved the winner.

PHILADELPHIA, September 11th. The sport commenced with the unfinished 2:33 race, postponed from the evening before. Purse for \$2,000; for horses that had never beaten 2:33. Mile heats, best three in five in harness; \$1,000 for the first. There were thirteen entries. Five horses were distanced. J. K. Leavitt's Star won. Time 2:33, 2:34; 2:30½. The first race on the regular programme was a purse of \$3,000, for horses that never trotted better than 2:24, mile heats, best three in five, in harness; \$1,700 to the first. After three exciting heats Crown Prince proved the winner. Thomas Jefferson, Jr., taking second money. Time 2:37½, 2:26½, 2:26½.

Winding up the meeting was the free-for-all purse of \$4,000, mile heats, best three in five, in harness; \$2,200 to the first, \$1,200 to the second and \$600 to the third horse. Entered for this was Budd Doble's bay mare Goldsmith Maid, Ben. Mace's bay gelding Sensation, J. J. Bowen's black gelding Camors and A. Goldsmith's black gelding Gloster. Won by Goldsmith Maid in three straight heats. Time 2:22, 2:25½, 2:24.

HARTFORD, Connecticut, September 12th.—The Plainville Park Association closed a very successful fall meeting. There were about 4,000 people present. The weather was fine and the track in fine condition. In the 2:50 race for \$1,000, four heats, Commodore Perry, of Providence, was the winner. Time, 2:39½. In the two 2:29 race, for a purse of \$1,500, four heats, Commodore, of Newburg, N. Y., won. Time, 2:33½. In the free-to-all race, for the \$2,000 purse, four heats, Judge Fullerton won. Time, 2:25.

LEXINGTON, September 12th.—The races of the Kentucky Association were the best during the week. The first race, two mile heats, was won by Wither's entry, Stanford, in 3:40½, making the last mile in 1:40½, and distanced his competitor, Mandarin, in the first heat.

Second race—Colt and filly stakes; two-year-old; \$50 entrance; play or pay; \$250 added; one mile. Three started, and the race was won easily by Robinson's Astral colt, by Asteroid, in 1:44½, being the fastest time for two-year-olds ever made. Letoler came in second, and Lagrange third.

LONDON, September 12th.—This was the fourth and last day of the Doncaster September meeting. The great race of the day was for the Doncaster cup, value 300 sovereigns. Mr. Savile's br. c. Uhlan, 3 years old, was the winner. The b. f. Lillian, 4 years old, belonging to the same gentleman, came in second, and Mr. R. N. Batt's ch. c. Thorn, 3 years old, third. There were five starters. The betting was three to one against Uhlan, three to one against Lillian, and six to four against Thorn.

Athletic Pastimes.

A cricket match was arranged to take place at Hoboken, September 13th, between the second eleven of the Manhattan Club and the first eleven of the Zingari Club. Only five of the Zingari's put in an appearance, so a scratch match was called, Messrs. Rutty and Ronaldson choosing sides. There was no difficulty in selecting two elevens, as a number of the first elevens of the Manhattan and St. George's Clubs were present. Rutty having won the toss, chose Hosford, Lewis, Tilly, Hayward, Oakley and Tucker, of the Manhattans; Green, of the St. George's, and Lendrum, Mooney and Boddy, of the Zingaris. Ronaldson chose Smith and Talbot, of the St. George's; Peters, of the Prospect Park; Parker, of the Staten Island; Lonergan, Bishop, Franklin, and Beattie, of the Manhattans; Orton of the Newark, and Roche, of the Jersey City Clubs.

The game was an exciting one, the batting of Tilly, Hayward, and Oakley on Rutty's side, and Ronaldson and Peters on Ronaldson's side being excellent. The bowling of Hosford and Ronaldson was also worthy of notice. The following is the score:

RUTTY'S SIDE.	
Hosford, c. Ronaldson, b. Lonergan.....	6
Tilly, b. Ronaldson.....	12
Rutty, b. Talbot.....	10
Lewis, st. Lonergan, b. Talbot.....	0
Hayward, b. Ronaldson.....	19
Lendrum hit wicket, b. Talbot.....	4
Mooney, c. Peters, b. Ronaldson.....	6
Oakley, c. Smith, b. Lonergan.....	24
Boddy, run out.....	2
Tucker, not out.....	4
Green, b. Beattie.....	2
Byes, 4; leg byes, 4; wides, 4; no balls, 1.....	13
Total.....	102

RONALDSON'S SIDE.	
Ronaldson, c. Mooney, b. Hosford.....	29
Smith, c. Rutty, b. Mooney.....	5
Peters, b. Hosford.....	7
Talbot, b. Hosford.....	1
Lonergan, c. Boddy, b. Hosford.....	0
Franklin, b. Richardson, b. Hosford.....	0
Bishop, c. Hayward, b. Lewis.....	0
Parker, not out.....	3
Roche, c. Boddy, b. Lewis.....	0
Beattie, c. Rutty, b. Hosford.....	2
Orton, b. Lewis.....	8
Leg byes, 1; wides, 3.....	4

Total..... 59

—The sixth game of the championship series between the Mutuals and Philadelphians was played September 13th, on the Union Grounds in the presence of an immense assemblage. The game was an exceedingly good one and free from errors, the Philadelphians charged with only six and the Mutuals four. A feature of the game was a magnificent running catch by Cuthbert, the equal of which is seldom seen on a ball ground. Holdsworth and Start carried off the honors of the infield for the Mutuals, the latter putting out no less than seventeen men. The Mutuals won, scoring seven to the Philadelphians two.

Captain Thomas Dean, of the thirteenth Regiment, Brooklyn, and late drill-master of the Brooklyn Police, is to open a billiard room about the first of November, in the new iron building, corner of Smith and Fulton streets. The room will contain fourteen tables, and surpass in some respects any similar place of resort in the two cities. Mr. Dean is a favorite, and remunerative support has been pledged him by many gentlemen not usually known in billiard circles.

What is the difference between a chime of bells, and a back salary grabber?—One peals from the steeple; the other steals from the people.

Important to sportsmen—The domestic hen is a good setter; so is a grocery loafer.

Motto of the Professional Nines—“Base is the slave that pays.”

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

FELIX, Baltimore—Mocking-birds begin to moult the last of July. The moulting season ought not to last more than three weeks, providing the bird is in good condition. If not well cared for, it may take three months before he gets his voice back. Keep birds out of draft, feed with nourishing food, not too plentifully. Bird must have quiet, and not be fretted.

YOUNG SPORTSMAN—Deer abound in McKean and Warren, but not in Forrest. All are good counties for game. No fear of roughs.

CONDU—Collies can be had in England from three guineas to ten pounds. Unless you have a friend to purchase, it is a risky business. Have tried English dog biscuits and do not like them.

H. R.—Reeves' gren felt is a preparation of gum cotton. The fibre is felted, then treated. In France a similar material made into paper pulp is used. Have tried it and found it excellent. It may, in time, be extensively used. It can be bought here. (See Gloan).

L. D., Brooklyn—The book you want will be published shortly in California, by Carmany & Co. Address them.

W. H. K., Boston—A handy book is Newhouse's Trapper's Guide. The very best is an English work, “Lord and Baines' Shifts and Expedients.”

A. A., Boston—Will give the whole subject our best attention next month, with character of game, methods of conveyance, hotels, &c. It is too early yet to go, being decidedly the most unhealthy season of the year in that section.

T. L., Jr.—Chap. XL, Revised Statutes, 1871, §41, says: “No mascal-longe, pickerel, pike, sun-fish, or bream, yellow perch, or black bass shall be introduced, by means of the live fish or spawn, to any waters where they do not now severally exist. See fourth number FOREST AND STREAM.

PISCATOR—Will Piscator be good enough to send his address? We and others wish to communicate with him on matters in the interest of science.

GAMMA—You ask how to load an 8 bore breech-loader so as to shoot hardest for brant. Clean and load shells yourself, as follows: Five drachms powder, two felt wads on top, one and a half ounces No. 2 shot; then pasteboard wad on top of powder. Do not drive too hard on shot so as to alter shape of shot. The use of oil in shot tends to lump them.

B. O.—You can get a caribou skin from Kaiser, Granville street, Halifax; cost, \$4 to \$10, according to size.

CALEB—Pilot fish (*Naucrates Ductor*). Facts as to its piloting the shark not fully established.

L. H. & N. U.—One dollar a day and found is what you ought to pay your Indians. You will want not more than four, two for each canoe. Five hundred dollars is ample for the trip.

D. S.—A gun made expressly for pigeon shooting will cost fully \$400 before it reaches you.

X. Z.—English decoys not as good as ours.

ORXITHO—Should think it was the cedar bird, from your description of plumage, yellowish brown, with a darker colored head, and the slaty blue of the wings, most especially from the red waxen tip on the wing, *ampelis cedrorum*. Consult Wilson.

BOYTOX—The Gadidae family are distinguished by having the ventral fins beneath the pectorals. The cod is of this family.

OVUM—In number four FOREST AND STREAM, you ask if a trout will “go back on its paternity, by eating its eggs.” We say yes, not only young males, but females also. Can see the thing often while lying on the covered spawning race watching operations below through the cracks in the boards. Mr. Fred Mather, of Honeoye Falls, informs us that he takes all his spawn on the Ainsworth screens now, and claims that he gets stronger and healthier fish, and though the percentage of impregnation is less than by handling the fish, he claims that he can raise more fish from a thousand eggs laid in the natural manner, than can be done by the hand operation.

[We must again beg correspondents to give us their names, as we will for the future give no replies to any anonymous questions, or return answers by letter. Time too much occupied.]

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

AT
103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, SEPT. 18, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

This paper sent gratuitously to all contributors.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Managing Editor.

Calendar of Events for the Current Week.

FRIDAY, Sept. 19—Kansas City Association, Mo.—Central Pennsylvania Association, Altoona, Penn.—Winfield Union Fair, Herkimer Co., N. Y.—Agricultural Fair, Bangor, Me.

SATURDAY, Sept. 20—Boat clubs, foot of 133d street, Harlem—East Saginaw Fair, Mich.—Grand Rapids, Fair, Mich.—Kansas City Fair, Kansas City, Mo.

MONDAY, Sept. 22—Topeka Fair, Kansas—Waverly Fair, New Jersey—Milwaukee Fair, Wis.

TUESDAY, Sept. 23—Prospect Park Association, Brooklyn, N. Y.—St. Paul Fair, St. Paul, Minn.—North Adams Fair, Hoosick Valley, Mass.—North Eastern Fair, Waterloo, Ind.—New York Western Fair, Rochester, N. Y.—Pennsylvania Central Fair, Erie, Penn.—Somerset Central Fair, Skowhegan, Me.

WEDNESDAY, Sept. 24—Prospect Park Association, Brooklyn, N. Y.—Albany Agricultural Fair, Albany, N. Y.—Murfreesboro Fair, Central Tennessee.

THURSDAY, Sept. 25—Prospect Park Association, Brooklyn, N. Y.—St. Paul Agricultural Fair, St. Paul, Minn.—Somerset Central Fair, Skowhegan, Me.

A WORD IN SEASON.

TWO very valuable papers the FOREST AND STREAM has given to the public since its birth, both of which relate to regions almost unknown and until recently unexplored by sportsmen. One descriptive of Anticosti Island was concluded in our last number; the other, relative to the Nepigon, remains to be completed. We trust our readers will appreciate their value, and realize that they may at some day not distant, be of practical utility for reference. Through our numerous available channels of information, we are enabled to supply gentlemen sportsmen with an unlimited fund of knowledge pertaining to the shooting and fishing grounds of America, of which most of them have hitherto been ignorant, and we can conscientiously assure our readers that this paper will not reach the climax of its effort and of accorded merit until it is made as indispensable a *sine qua non* to our own people as the London "Field" and "Land and Water" are to the gentlemen of England. In the course of the two coming months we shall be placed in a position to redeem this pledge.

We wish, moreover, to impress upon the public that the material of this paper is made up directly from resources which are tributary to its requirements, and not from matter collected from contemporary journals in the interest of out-door sports. The aid that we have secured from official and semi-official sources, as well as from private contributors, is calculated to make the FOREST AND STREAM an accepted

and reliable authority on most of the subjects that come within its scope. Our subscription list already includes some hundreds of leading naturalists, sportsmen, and "gentlemen in general," most of whom, in sending their favors, affirm that they have never yet been subscribers to any sporting journal (so called), and that this paper exactly meets their views and requirements. Our sole ambition is to merit a continuance of their confidence and approval.

MIGRATIONS OF FISH.

IN Sweden, in 1556, there was a *Land-stotning*. That is, the fish, having emerged from the deeps, appeared in incalculable numbers in the Skargard, and thus continued until 1587, a period of thirty-one years, when they as suddenly absented themselves. During the period of glut, the fisheries are described as having been more productive than at any other on record. Old chroniclers state "that for a space of fifty or sixty miles the shores of the main land, and the adjacent islands, were scattered with curing and salting-houses, many of them two and three stories high, and inhabited by vast multitudes of people who had congregated there from various and distant parts, and whose sole occupation was in connection with the fisheries. That herrings were there so very abundant that thousands of ships came annually from Denmark, Germany, Friesland, Holland, England, and France to purchase fish." This would not seem to be a very exaggerated account, as from the small town of Marstrand alone, no less than 600,000 *tunnor*, or some 2,400,000 bushels were yearly exported.

The disappearance of the fish in 1587, which reduced the fishing people to penury and misery, was, according to the belief of the age, foreboded by the capture of a herring—the queen of the family, as it was supposed—of such enormous size, that two men could with difficulty carry it suspended on a pole! During a space of seventy-three years, the herring appeared again, but in small numbers, when, in 1663, there was another arrival, though not comparable to that of 1556. In 1774 was the last great advent of herring, which lasted until 1804. In 1803, herring again as mysteriously left the coast, and have never again visited it in an overwhelming way. Swedish naturalists, deputed by the Government to account for the absence of the fish at that time, imputed it to various reasons. Among them "to the noise and uproar when the fisheries were flourishing, caused by the tens of thousands of congregated people, which noise, in calm weather, or when the wind was off the land, might be heard miles and miles at sea; the enormous quantity of refuse of all kinds cast out from the curing and boiling-houses into the sea, which on sinking, destroyed all submarine vegetation, and masses of which resembling floating islands, emitting a dreadful stench, which might, at times, be met with far away from land. Though more than half a century has since elapsed, the places where this filth deposited itself in any considerable quantity, are still quite visible, and by the fishermen called *lod-bottnar* or death-spots.

These interesting facts just stated we have compiled from various sources. We have not a very high opinion of the astuteness of the Government naturalists of that day, although as respects one of the causes attributed—that of the putrid offal—it doubtless had a decided effect to diminish the quantity of fish. The chief reasons, probably, were the great destruction of fry and lesser fish by the small size of the meshes of the nets and the use of a drag net of gigantic proportions, which swept the bottom and destroyed all the grass and plants amongst which herrings are accustomed to spawn.

The whole subject of the migration of fishes is most interesting, though their movements are not more mysterious, perhaps, than the migration of deer, buffalo, and other wild animals, only that they are hidden from observation by the unsearchable element in which they live. The whole family of fishes is divided into pursuers and pursued, and the instinctive effort to escape may lead the pursuit to localities far beyond the climatic and natural range of the pursuer. Change of temperature in the water has also its most important effect, and the same organic laws that have made some races of land animals extinct, and driven others far beyond the boundaries of old established haunts, operate equally upon the denizens of the sea. Caprice, too, has something to do with changes of habitat, and we cannot think it more strange that the salmon should desert rivers that it has resorted to for generations than that wolves, deer, or wild turkeys should suddenly disappear in this place and present themselves in that.

Bluefish, and many others both nomadic and stationary, have made an unexpected appearance on our northern coasts from time to time, and we have already remarked in previous numbers of this paper that several species peculiar to equatorial and semi-tropical waters have, within two or three years, been met with here. Perhaps the temperature of the sea is changing in this latitude. As regards pursuit, however, if we could determine the advent of the food fish by the coming and going of the small fry, an important and useful scientific point could be gained; but, as it happens, the shoal of bluefish, herring, or mackerel in salt water, or the whitefish, herring, and salmon-trout of the lakes do not incessantly follow one single shoal of small fry until they have incontinently consumed them. The mood may take the pursuer to suddenly dart off in a different direction after other fry, and so, after following this chase and that for a time indefinite, the haunts that knew them familiarly once may be deserted for a long period of consecutive years, or, possibly, "know them no more forever."

Still, with the most plausible, theoretical accounting for of facts, it does seem singular that these immense shoals of fish, incredible in number and extent, should visit certain points on the seaboard and inland coasts, not periodically, but sporadically; and their advent is always recorded as a marvellous phenomenon of the times. The most extraordinary of these occurrences ever mentioned was witnessed on the southern shore of Lake Superior about the 10th of June, 1870, just off the harbor of Marquette. A letter of that date, in our possession, says:—"The lake was filled by a large body of salmon-trout. They presented a front of *sixty miles*, facing Marquette and extending out into the lake to 'Stannard's Rock,' forty miles distant from shore. A steamer was chartered, and a party of men, women, and children started for the rock; they fished for four hours, and took four hundred trout, weighing from six to forty pounds each. The next week another party started, and in four hours took eight hundred trout, weighing from six to forty pounds each. It was then discovered that there was no use in going such a distance, as the harbor was full of them. I and my youngest son took a yawl and started to try our luck in the harbor. In less than three hours we loaded her down to the water's edge. We had small oars, and rowed with one hand and held the trolling line in the other. We used a spoon. One young man went out in a yawl to see how many he could take, and he caught one hundred and fifty and then gave up."

This is no fish story, but can be authenticated in a hundred ways. The fish filled an area of forty miles by sixty in extent, and were off the harbor of Marquette two weeks. The prevailing winds during the visit of the shoal came from the southwest, with occasional thunder showers.

With regard to the feeding of the trout, it was observed that most of them threw from their stomachs, on being hauled into the boat, from three to four small herring six or eight inches long. The herring were fresh, and seemed to have been taken but a few minutes before the trout were caught. It is possible that this shoal of trout followed a shoal of herring, feeding on them as they travelled south, as that appeared to be the direction in which they were moving. The trout averaged twelve pounds each in weight. There must have been millions of them in the school.

ENGLISH EDUCATIONAL SCIENCE COMMISSION.

A MOST important discussion is now going on in England in regard to the introduction of scientific studies into the Universities, and the report which has been just published is well worthy of our attention. Especial attention is directed to the remarks of Sir Benjamin Brodie, who stated in order to show what a demand there is to-day for scientific laborers of the highest quality, that in England "almost every scientific man is caught up instantly for educational purposes, for the object of teaching alone; and in the next place a very great draft indeed is made upon Science for economical purposes; I mean for purposes connected with practical life. In sanitary matters we have numerous examples of the vast amount of work done by scientific men for public and practical objects. So that the supply of scientific men is not equal to the demand, for those objects alone."

The smattering of science, distributed in small doses over the English University term of instruction, according to Sir W. Thompson, is productive of the smallest possible amount of good. The emulation of the student directed to no special point of research, he fails to see the immense advantages that a more profound knowledge in any particular branch would give him.

Another subject dwelt especially on by the committee is in regard to Fellowships, and the creation of them with some small salary sufficient to give its recipient, if not ease, at least independence, during a course of scientific research. When Mr. Tyndall was in the United States, he told us quite feelingly how hard it was for the man of patient study, the scientist who ought to be for years giving the best days of his life to the elucidation of some fact, to have to eke out his existence through the drudgery of teaching. If advantages of this character, such as Fellowships, are given in Scotland, such does not seem to be the case in England. The foreign methods adopted in the *Ecole Pratique des Hautes Etudes* are particularly recommended. In regard to it, the Committee state that "the course pursued by this institution is to take young men who have completed their preliminary scientific studies, and allowing them an annual stipend to defray the expenses of their maintenance, to place them under the care of competent professors, who give them assistance and advice in their first researches, and to whom they afterwards become useful. This plan appears to us so excellent in itself, and at the same time so academic in its general character, that we desire to recommend it for adoption at Oxford and Cambridge. To insure due attention to both classes of students, it would be proper that the laboratories intended for training in the methods of research should be distinct from those in which more elementary instruction is given."

There is even, it seems, in conservative England some idea of giving Doctorates of Science, in imitation of the German universities. That there is a grand awakening on this subject of university training is very certain. Slow to move though the English may be, some radical changes are quite likely to be effected.

—On the tip end of "Anthony's Nose," Lake George, appears conspicuously the advertisement of "Vinegar Bitters." Is this a desecration of nature, or is it according to nature, that this infallible sign should thus assert itself?

THE SARATOGA REGATTA.

IF some familiar names known among our amateur oarsmen were wanting in this contest, the race itself was in every respect a model one, and well worthy of putting on record. Aside from the spirited nature of the struggle, there was one excellent element about it, the perfect harmony with which everything went off, and the absence of all strife and bickering. The unpleasant feeling which was manifested in the Springfield race did not occur, and to the conquerors were instantly adjudged their well earned rewards. Such accidents as may arise about stake-boats and buoys, from ignorance of crews, and incompetency of judges, we trust will no longer mar the pleasures of our amateur contests. Saratoga Lake is, perhaps, one of the best waters in the United States for boating contests. Three quarters surrounded by woods, the wind has but very little effect, so that the water is rarely lumpy, and of course influences of currents are unknown. We again have to commend the fact that no gambling was allowed, and that the authorities had combined with the managers of the race to entirely exclude anything like pools. Efforts of this kind are in the highest degree proper, and must tend to elevate the sport to that high position which all gentlemen desire amateur boating should assume in the United States.

There can be no possible grumble at the victory gained by the Messrs. Lamb. They showed themselves thorough oarsmen. It is exactly by meeting rivals of this calibre that true proficiency will be acquired by our own men. Of course our amateur friends will do wisely to profit by the lesson they have received.

With a little more care and judgment by beginners to train our boys at an earlier age to athletic sports, the time will come when we will put our English friends up to their mettle.

WHAT THE GERMANS SAY ABOUT WOOD CUTTING.

THE Germans, who have made a science of arboriculture, with their admirable powers of scientific analysis, have determined pretty exactly how much water is preserved by the soil covered by their forests. They do not, however, indulge only in simple speculations in regard to this self-evident fact, but, in some cases, have brought the calculations down to a question of gallons. From the *Ausland* we translate as follows: "The woods, thicket, and herbage which cover the ground, we all know, hold the rain-water which falls on them. The sole reason for this is, that there is less chance of the water evaporating. The best idea that can be had of what would be the effect of cutting down the woods, would be presented by supposing we denuded the Spessant Mountain of its trees, which mountain rises in the right side of the Mein (Maine) on one side of the valley which divides it from the Odenwald. The cutting of the wood on this single mountain would prevent the formation of a river as large as the Mein before Aschaffenburg, whose flow would be continuous during a period of sixteen days."

Here is shown, in that admirable practical way the Germans have of imparting knowledge, exactly the facts the FOREST AND STREAM is so desirous of making public, in regard to indiscriminate, senseless wood cutting. Data of this character we think are essential, and if reiterated, must at last have their effect on the public mind. Cut down the Adirondack region, and it is no exaggeration to state that the volume of the Hudson will be appreciably diminished.

TRESPASS.

A VERY proper amount of prejudice exists in the United States in regard to the stringency of the English game laws. As was justly remarked by a prominent English statesman, "that miserable animal, the rabbit, has been the cause of more class-hatred in Great Britain than any of the most obnoxious acts passed by Parliament." If Herbert Spencer, in some of his admirable essays, has quite clearly proved that almost all the modern efforts of legislation have been directed towards diminishing the vigorous character of certain laws imposed on us by generations that have gone before, such arguments hardly hold good in this newer country of ours. Game restrictions in England may be sometimes rigorous, extending not only towards the game itself, but taxing pretty roundly those who carry guns; but without advocating any extreme measures we must nevertheless animadvert if not to the singular laxity with which our game laws are administered, at least to the indifference in regard to trespass.

This matter of trespass seems to be now a growing evil, and the cases of individual injury are so frequent that we are in receipt of numerous letters requesting us to use our influence to prevent it. Each year, just about this time, men with guns (not sportsmen) assemble from every quarter of the United States and track the Western corn-fields and prairies in search of the pinnated grouse. They shoot right and left, without leave or license. The farmers of our prairies are as generous a set of men as ever lived, many of them good sportsmen, and, actuated by no dog-in-the-manger motives, are now up in arms at this violation of their grounds. Every year they see their grounds destroyed, their birds slaughtered, and they can find no redress. They ask us what are they to do. Some even go so far as to intimate a desire to take the law in their own hands. Such measures we must deprecate. The redress lies in taking the laws made against trespass out of the civil courts; which is a tedious and ineffective process of law,

and of having cases of trespass tried by the more prompt action of the criminal courts. Privileges to shoot should be considered as property, and might be sold by our Western prairie owners, and without any idea of money being made out of them. With the proceeds of the sale of such licenses men might be employed to guard the grounds, who could prevent trespass. We doubt very much the efficacy of having State officials to attend to these duties, something like the French *garde de chasse*. Such duties could be better undertaken by men paid for this purpose. That trespassing, all over the country, is a growing nuisance is very certain, and that prompt measures for correcting this evil are necessary, is equally evident.

MOCCASINS.

WE have received some letters from friends *en route* for Nova Scotia and the Dominion of Canada, intent on moose and caribou hunting, who are desirous of obtaining some information in regard to moccasins. Such moccasins as we find at Saratoga, are only proper to use in a bed-room. The real hunting moccasins, which can stand any amount of usage are an entirely different thing. There are two kinds of moccasins used in the Canadas, one which may be called the shoe moccasin, low cut, fitted for going over smooth ground, the other coming up higher, proper for rough country, and where brambles are found, and commonly called the shoe-pack. Both kinds should be made of the hide of the caribou. The skin of the caribou contains within itself a great deal of natural oil, is remarkably tough and moderately elastic. The hide should be regularly tanned in oak bark; all preparations containing alum destroys its excellent qualities. The hide of the caribou, especially in the male near the neck, is almost an inch in thickness. The hair itself is very close and curly, looking like grey moss. In tanning, hide and hair should be cured together. In making a pair of moccasin boots, have the sole broad and the heels low, and sew the seams with the sinews of the caribou. Moccasins dipped in the melted fat of the animal makes them almost impervious to snow and water. The boot should by all means have a tongue of caribou hide, not a thin one, but one which will fully cover the instep and ankle. It should invariably be laced with caribou thongs. If a boot of caribou hide is rubbed with the ordinary preparations of tallow and Burgundy pitch or dubbing, it seems to retain such substances longer than any other kind of leather. All village shoemakers in the Provinces can turn out a servicable pair of moccasins, and know how to make a good fit. Never wear high boots in hunting moose or caribou; they make too much noise in those still woods. Besides boots are rapidly worn out, going over the rocky ground, and become soon useless. An excellent sole is made, and a most lasting one, by taking a piece of hide with the hair on, doubling it on the skin side, leaving the hair outside, and then sewing it together. The durability of a sole of this character is remarkable.

In camp when coming home from a wet hunt, never put either boots, shoes, or moccasins too near the fire. It is better to hang them up above your head, and let them dry slowly. The smoke of the camp fire seems to improve them. Sometimes moccasins may be frozen stiff; they must then be completely thawed out, and whilst not too near the fire rub deer fat into them. No one who has hunted in moccasins takes again to the boots or shoes of civilization without regret. In fact nothing can be made more unphilosophical than our boots and shoes, as to their construction. The writer has frequently shot on the prairies, for a whole season, following the grouse over the tough wiry grass, with a single pair of Canadian moccasins, while his companions have worn and cut out two pairs of ordinary hunting shoes in the same time. Perhaps, had the learned Chancellor of England, Erskine, known about moccasins, he might not have said, what Rogers declares he did say on his death-bed, which was: "When that dread hour comes when all our secrets will be shown, then only shall we know the reason why shoes are always made so tight."

AMERICANISMS IN SHAKSPEARE.

FROM Dr. Charles Stearn's clever book on the wisdom and knowledge of Shakspeare we select the following fragments, from a chapter with the above caption. Such fossil words as have remained with us should be treasured. Brought over here three centuries ago, they still defy all attempts to cover them over with the fresher alluvial deposit. We note particularly these that follow:

"Siely fingered from the *deck*." 3 Henry, VI. V. I.—A similar use of the word "deck" for a pack of playing cards is common at the present day throughout the Western and Southern States.

"When I cried Ho! like boys in a muss." Antony and Cleopatra, III. 2. Muss is a familiar word to Americans, as meaning a slight brawl, or disturbance.

Then again *flapjack*, is Shakspearian, too, for what do the fishermen say to the ship-wrecked Prince Pericles? "Moreover, puddings and flapjacks," that were promised him. "Flapjacks," are those broad, thin and extemporaneously prepared cakes, now called pancakes, and consecrated in Old England to Shrove Tuesday, but which are yet known in New England by their Shakspearian name. In regard to horses, Dr. Stearns quotes from Macbeth to show that the Mexican *stampede* was not unknown to him. Duncan's horses are said to have "Turned wild in nature, broke their stalls, flung out, contending 'gainst obedience."

The critic says, "this sort of panic is probably unknown in England at the present day, and could only have hap-

pened in parts of the country comparatively thinly settled. In a newly settled country, stalls for horses are little more than small sheds fenced about with wooden palings. Duncan's horses could not "break" or "fling out," from well built brick stalls. Again of Duncan's horses: "'Tis said they eat each other."

Dr. Stearns states that "this language, used of horses, sounds like poetical exaggeration. Yet it happens to be true. Horses when loose and engaged in deadly conflict with each other, use only their teeth, and aim to get at one another's throats, but never use their heels. They kick only when quarrelling, or if they are tired and hampered in some way."

KILLING A GRIZZLY BEAR.

A CORRESPONDENT of the *Tribune* on the Hayden expedition writes as follows:

"On this beautiful green meadow, all our three divisions encamped. Not that it was wholly destitute before of an occupant and owner. Unmistakable signs in great abundance and freshness showed at once that it was the pasture and play ground of a large bear. To avoid any strife as to the rightful possession, one of the party shot his bear-ship yesterday. It was a good sized grizzly bear, old and tough beyond the average of his kind. His teeth were well worn, one or two of the front ones even giving way and decaying, and his skull was completely ball-proof. He was really killed by the first shot, one of Meigs's explosive bullets taking effect just behind the head and blowing the first cervical vertebra to pieces; but as he stilled moved, two or three solid shots were, by way of precaution, fired through the head, as was supposed, from a good Remington rifle at 30 yards' distance, but they simply flattened against the bone, without penetrating it or leaving a mark. People may look incredulous, but I have in my pocket one of the flattened bullets taken from between the skin and the maxillary arch, and the skull may be examined by any one in the Smithsonian collection next winter."

A gentleman attached to the Hayden expedition has called on us, and on our asking about the flattening of the balls, when fired at this bear, he states that the gun used in this particular case was a light Remington sporting rifle, that it was loaded with the regular army cartridge, and that the distance was about fifty yards. He states that the balls struck the bear just where a heavy dense muscle covered the grizzly skull, which muscle was fully four inches thick. The bear weighed 1,000 pounds, and being in prime order, was excellent food. He repudiates all stories of the stabbing a bear with a knife, insisting that the hide is so thick that no steel will penetrate it.

THE UNITED STATES FISH COMMISSION.—The gentlemen named below comprise the United States Fish Commission, whose headquarters are at Peak's Island, Maine. They all serve without any compensation whatever, and pay their own expenses. They give the Government the first choice from the specimens which they collect, and furnish gratuitously all professional services required of them. In return they receive merely the advantages of the outfit and the facilities thereby afforded for collecting. Science is always enthusiastic, generous, self-denying! The names are here-given:—

Prof. S. T. Baird, Assistant Secretary Smithsonian Inst.
Prof. A. E. Verrill, Professor Zoology, Yale College.
Prof. S. I. Smith, Assistant Prof. Zoology, Yale College.
Prof. J. E. Todd, Professor Zoology, Tabor College, Iowa.
Prof. E. Y. Nelson, Ohio Wesleyan Union, Delaware, Ohio.
Prof. Wm. Rice, Wesleyan Union, Middletown, Conn.
Prof. J. K. Thatcher, Tutor, Yale College.
Mr. J. B. Goode, Curator Museum, Wesleyan, Union Middletown, Conn.
Dr. E. Pulmer, Curator, Smithsonian Institute.
Mr. J. H. Emerton, Artist, Boston Soc. Nat. Hist.
Mr. H. Benner, Student, Yale College.
Mr. H. E. Rockwell, Phonographer, Washington, D. C.
Mr. Spencer Biddle, Philadelphia.
Dr. Scovil, Indiana.
Dr. J. B. Holder, Central Park Museum, New York.

TALL FIGURES.—The sale of the famous New York Mills stock took place on the 10th, three miles from Utica. The origin of the herd was the purchase made by Mr. Samuel Thorne of New York of several animals of the Duchess tribe at the famous sale of Earl Ducie in 1852, which he bought for his father, and for Col. Lewis G. Morris.

Among the English breeders present may be mentioned the Right Hon. Lord Skelmersdale, whose seat is near Liverpool; Mr. Halford, of Papillon Market Harbor; Mr. Calthorpe; Mr. Richardson, who represents Sir Curtis Lampson, of Sussex; Mr. Berwick agent for Lord Dunmore, but who buys for Earl Bective, recently of Lord Kenlis, of Underly Hall, Lancashire, and Mr. Kello, agent for Mr. R. Pavin Davis, of Horton, Gloucestershire. Messrs. Cochrane, Christie, Miller, and Beattie of Canada were also present.

The three year old bull, second Duke of Oneida, was sold for \$12,000, to Mr. McGibbon of Cynthia, Kentucky. First Duchess of Oneida was bought by Lord Skelmersdale, for \$30,000. The tenth Duchess found a purchaser, Lord Bective, at \$35,000. Eleven cows of the same august family, \$238,800. There were 111 animals presented, realizing \$481,585. Some day we will send horses and dogs to England.

We understand that the manufacturers of the Ballard rifle have ceased making them, and sold their machinery. Messrs. Smith & Squires, 523 Broadway, purchased some time ago a large number, and have a few left. It is a good opportunity for those who desire one of these excellent breech muzzle-loaders to purchase one at once, as no more will be made.

News from Abroad.

OUR English friends are just over the St. Leger. Doubtless it was an exciting event, and was cleverly won by Marie Stewart, against such a field as Kaiser, Doncaster, and Gang-Forward. Perhaps fortunes were won and lost on it. It was, however, not what is called in England a betting race. From the first it was pretty certain that one of the four favorites would be sure to win. There must, however, always be a certain amount of glorious uncertainty about "dice on four legs," not only as to whether a horse can win, but sometimes as to the probable existence of the horse, for just now the English sporting fraternity are quite exercised about a railroad accident. Not that some hundreds of common people were smashed, but because two famous young colts, the possible favorites at Oxford, came to an untimely end in a late collision. Of course human casualties of this character are quite insignificant; but as a leading English authority has it, "the horses will appeal to the Company in their most sensitive part—their pockets." It is neither refreshing nor consoling, but it seems to us they smash up quite as much in England as they do in the United States. Sometime ago, in regard to the transportation of dogs in the United States, we mentioned the trouble and risk attending such shipments, and now, in England, they state exactly the same thing. When one learns that there are no less than seventy dog exhibitions in England, it seems difficult to understand how railroads can be at fault; we see, nevertheless, a circular letter in the *Field*, addressed to all the leading English railways, issued by the National Canine Society, Eldon Chambers, Nottinghamshire, imploring the British Railway directors to give better accommodations to the traveling dog. At present in England, there are in full blast, no less than eight agricultural shows, four dog exhibitions, and six poultry collections; and the journals are filled with descriptions of the many wonderful excellencies of the animals and birds. As we expected, the first volume of the Grouse Encyclopedia has presented itself to the English public, to be followed by a whole British museum of such volumes a little later. English sporting advertisements alone present a world of information. From them can be gathered the epitome of their pastimes. Just now the coming hunting season shows itself, by wants, such as for Huntsmen, Kennel-men, and Fielders. How many American lads could fill the following place, with its various functions?

WANTED—A WHIP for the Taunton Vale HARRIERS; a smart active man, light weight, a good rider across the country, and a good groom; one who has been whip to a pack of foxhounds, and could hunt hounds if required, would be preferred; he would not have to assist in the stable, but a kennel-man kept; none but men of good character need apply.

—News from the grouse does not improve. The Earl of Stramford, after the second day, stops all shooting, and we look forward to an obligatory closing of the shooting season. In Ireland, however, birds are plenty, and there is an exodus of sportsmen there.

—Of Polo, very possibly the ponies are not yet over their hard spring work, but during a period of leisure the Carlton Club have had time to issue a set of rules governing this game. One rule of hardly an amusing character we copy in full: "Any player may interpose his pony before an antagonist, so as to prevent the latter reaching the ball, whether in full career or otherwise, and this despite the immediate neighborhood of the ball." That means that should the ball be going, and a man put his horse broad-side to it, to stop an adversary coming on, it is perfectly legitimate to ride over him, if you can, providing you have the heavier mount. We wonder if Frenchmen have tried their hand at this game? People are inclined somewhat, and we think very ignorantly, to underrate French equestrianism. They may not be rough riders in the English sense of the term, though we have seen in our time a stag sent through Fontainebleau with a skurry of riders after him, when not only a good deal of courage and pluck was shown, but some very famous English gentlemen riders were left at the fag end of the chase. A very interesting portion of the English papers is that devoted to the report of the select committee on horses. It seems to show that neither thorough-breeds, nor racers, nor hunters, nor carriage horses have diminished, but that the dearth is to be found among agricultural horses. In 1870, in England, there were 977,707 horses of all kinds used for agricultural purposes, and in 1872 there was a decrease of 15,159. The causes assigned are the exportation of horses, and the increased profits on the raising of sheep and cattle rendering the rearing of horses less profitable.

—The "*Field*" (London) notes a decrease in gun accidents every year, although we may take it for granted that firearms of every description are now more used than ever they were before. Considering the number of volunteer riflemen, who are practising daily or weekly with their weapons, we may even feel surprised that accidents arising from this source are so few and far between. As to shooting on the moors, especially since the introduction of the breech-loader, it is fortunately seldom indeed that we are called upon to record a catastrophe at the grouse hunts. But there is in connection with guns one fertile source and cause of manslaughter, against which we would reiterate a caution and protest. There is absolutely no excuse now for leaving a gun loaded in a house, and it is a downright criminal act of negligence, morally if not legally, to place a charged double-barrel in the way of servants or children.

—English yachtsmen are getting into bad repute. They are netting salmon in the Scotch estuaries, which is a shameful act.

—The number of deer kept in Windsor Great Park, England, on an average of the last ten years, is 1,658, as appears from a return just issued; the number killed is 128, and sixteen are annually required for the Royal Hunt. The net cost is estimated as under £1,500 a year. In Richmond Park, Bushy Park, Hampton Court Park, and Greenwich Park, the number of deer kept is 2,889; the number killed per year, 372; the estimated cost annually, £4,894. At Phoenix Park, Dublin, 780 are annually kept; 106 are annually killed, of which thirty are given to the poor and sold; the remainder for distribution in Her Majesty's service. The average net annual cost is £203.

HONORS THROWN BROADCAST.—The Shah of Persia was so much delighted with the *Jardin des Plantes*, as to be desirous of distributing decorations among the great Parisian scientists who direct it. Unhappily the Persian monarch somewhat dashed the pleasure of the decorative men of science by an awkward blunder. Mixing up the living and the dead, men with animals, in his royal note book, while M. St. Hilairé got a "sun" in rubies, the *Dinotherium* was enobled with a "lion" in diamonds. Milne Edwards and the *Megatherium*, were both made happy in one and the same gift.

AN EARLY ELECTRICIAN.—English papers record the death of Sir Francis Ronalds in his 89th year, at Battle, in Sussex, during the last month. Sir Francis was well known, many years ago, for his experiments in electricity. In 1823 he published a pamphlet containing an account of some of his experiments, and explaining his plan of an electric telegraph. He had erected in his own garden, a number of poles supporting eight miles of wire, and through this wire he sent his messages. Each message was read at the further end by means of two needles moving on a dial plate much the same as that which afterwards came into general use. The spark in his telegraph system was, however, created by an electric machine, and not, as in existing systems, by a galvanic battery. In recognition of the value of his discovery, the Government bestowed on him the honor of knighthood in 1870, when the same mark of appreciation had been conferred on Sir Charles Wheatstone for his improvement of the telegraph.

Shot Gun and Rifle.

GAME IN SEASON FOR SEPTEMBER.

Moose, <i>Alces Macchis.</i>)	Caribou, <i>Tarandus Rangifer.</i>)
Elk or Wapiti, <i>Cervus Canadensis.</i>)	Red Deer, <i>Capreolus Virginianus.</i>)
Rabbits, common Brown and Grey.)	Squirrels, Red Black and Gray.)
Wild Turkey, <i>Meleagris gallopavo.</i>)	Quail, <i>Ophrys Virginiana.</i>)
Woodcock, <i>Scolopax rusticola.</i>)	Pinnated Grouse, <i>Tetrao Cupido.</i>)
Ruffed Grouse, <i>Tetrao umbellus.</i>)	Curlew, <i>Numenius Arqutata.</i>)
Esquimaux Curlew, <i>Numenius borealis.</i>)	Sandpipers, <i>Tringine.</i>)
Plover, <i>Charadrius.</i>)	Willetts,
Godwit, <i>Limosa.</i>)	Reed or Rice Birds, <i>Dolichonyx orizivon.</i>
Rails, <i>Rallus Virginianus.</i>)	

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—The cool weather of mid-September is scattering the coveys of partridge and grouse, and soon the persistent pursuit of the sportsman will have broken up still more the old family connections, and thousands of the toothsome birds will have gone to pot and bag. Already reports begin to come from our correspondents out West. See our very interesting letter from Wisconsin to-day.

—The same frosts that are painting the foliage of our northern forests with crimson and yellow hues, are setting the blue in the livery coats of the deer, and infusing new blood and vigor into the courtly stags that roam their wilderness domain. The royal blood of the old bull moose is aroused at the call of his stately dame, and the crash of his antlers is heard through the brush and dead limbs as he rushes in headlong career, with eyes half blinded by love to respond to the wooing. Now the hour of the hunter's opportunity begins, and with a trumpet of birch bark ingeniously fashioned, he hies forth to familiar stamping grounds, and with nicest imitation calls up the noble game by its siren notes. Eager are the yearnings and kindling anticipations of the old bull moose; and as certain his doom by fatal rifle-ball! What grand old experiences of moose-hunting we shall have to recount to our readers during the winter months! What wars of rival monarchs! What subterfuges to circumvent by counter-wiles the artifices of the hunter! What shifts to pick a precarious living among the crusted snow drifts that cover the ground a fathom in depth! What curiosities of natural history are associated with this mighty monarch, the largest of the *Cervi* family, and the sole survivor of the ancient race of giants that once inhabited Europe and America!

Then the caribou, too, will claim some share of the hunter's attention, though not so much valued in the chase, or for his flesh, which is by no means as succulent and toothsome as that of the moose, or even the common red deer. There are no viands comestible equal to a juicy moose steak, and no tidbit so worthy the school of epicures as the "muffe" of the moose. Between a beaver's tail and a moose's muffe, a connoisseur in backwoods economy would be scarcely able to give a decided preference. However, as the one is an appendage caudal, and the other of the nose, nasal, it is not strange that he should be unable to pass so abruptly from one extreme to the other in the matter of expressing a choice. But, speaking of the caribou, and throwing jokes (real or intended) aside, we will soon find his grizzled contour blending with the grey granite boulders of

the upland barrens, whither he will go to gather mosses when the frost has bared the trees of browse. Meanwhile we will have good sport stalking him in the hunt; all of which matters will receive full attention in our columns, in due course of time; for as we do not hunt out of season, neither do we give much space to description of unseasonable species.

We propose now to open to the notice of our not always thoroughly informed readers, one of the finest hunting grounds to be found in any part of America; and as the season progresses, to introduce them to other localities in various parts of the country. Old sportsmen will graciously bear in mind that our paper is prepared with especial reference to the information of novices and the uninformed, and that if we repeat what they already know, it need not be construed into a reflection upon them, while it may be of essential service to those not so well posted.

The region we refer to lies in New Brunswick, and embraces one million and a quarter acres of wilderness comprising the county of Restigouche, the same being traversed in all directions by the Restigouche river and its tributaries, which afford easy thoroughfares for canoes to its innermost penetralia. To reach this district, the main artery, the Restigouche, must be made the objective point, either at its mouth or at its upper waters. For the former, take railway or steamboat to St. John, thence railway to Shediac on the Gulf of St. Lawrence; and the Gulf Port line of steamers thence to Dalhousie. Twenty miles above Dalhousie is the celebrated hostelry of Daniel Fraser, Esq., where really elegant accommodation is provided for gentlemen and their families, not in a log house, or old-fashioned farm house, but in a modern commodious structure, with the convenience of a post office, telegraph line, and, when the Intercolonial Railway is completed, of a seat in the first train for home at your very door. Here can be obtained canoes, guides, and provisions, for the journey up the river; and in case sportsmen come into the wilderness at the upper end of the route, goods and necessities must be sent up from here by a previous timely order to meet the incoming party. Mr. Fraser has this month already sent six canoes for parties of Brooklyn and New York gentlemen, who have gone there upon our own recommendation. It is about eighty miles up stream to the portage which must be crossed by those taking the other route, which is by railway via Bangor to St. Croix, on the European and North American Railway, thence to Woodstock by rail, and thence by stage via the Grand Falls to the mouth of Grand river, which is fifteen miles further the whole stage journey being about forty-five miles over a most excellent and picturesque road that follows the course of the noble St. John River. At Grand River, batteaux can be procured through Mr. Violet, a French Canadian, to take you to the portage, fifteen miles up the river, at which point you meet the canoes from below. The advantage of the latter route is that you reach more quickly the heart of the hunting country though for the matter of game, there is plenty, from Dan Fraser's all the way up stream, with the exception of an inhabited stretch of the first twenty miles or so.

In this wilderness, the moose, caribou, bear, wild cat, and lucifee, still abound, beavers build their dams, and many varieties of fur-bearing animals and small game are found. The streams are filled with salmon and trout in their season. We shall have occasion to recur frequently to this region.

The cost of a canoe and two Indians per day is \$2 "and found." A hundred dollars ought to cover the expenses of a three weeks trip, the fare from New York being about sixty dollars for the round trip.

—A firm in Chicago is engaged in preserving game—such as grouse, snipe, quail, woodcock, &c.

—A faithful correspondent in Halifax, Nova Scotia, encloses a letter to us from his brother in China, who with two other guns, went on a hunt up the Yang-tse-Kiang, above Shanghai, some weeks since and secured the following bag in the course of twenty-three days, viz., forty-seven deer, fifty ducks, fifty teal, and one thousand pheasants. This is something like sport and "knocks the hind sights clean off" anything that can be done in this country or Canada.

—The shooting in Nova Scotia, commenced on the 1st. September, but the cover is yet too thick, and the birds are weak and poor.

—Within the past few days there has been some heavy work done in plover shooting in Westmorland County, New Brunswick. Mr. John R. Lawrence shot sixty plovers on the marshes near Moncton, on Thursday and Friday last. Judge Botsford shot upwards of sixty near Memramcook on Saturday. Messrs. Oulton and Hickman, Barisiers, of Dorchester, say they shot eighty-four on Tuesday.

—Mr. Oliver D. Schock writes us from Harrisburg, Pa., September 11th:—

"Our sportsmen are preparing to make a general war on the rabbits, and as they are plenty, they will no doubt get a full share of them. Every year, citizens of the surrounding cities pay our healthy town a visit, to go hunting on our mountain.

Partridges are getting plentier, since the law prohibiting their destruction is in force. Pheasants are very rare; occasionally two or three can be met on the Blue Mountain.

Gray and red squirrels, foxes, minks, and weasels also abound on the above mountain. A report was in circulation that a wild man, six feet in height, whose body was entirely covered with hair about three inches in length, was seen sleeping on the mountain, and sometime after that another report came, to the effect that he was shot about ten miles from here, and it then turned out to be a full-grown kangaroo, which no doubt had escaped from some travelling menagerie. If so, some showman is minus one large kangaroo."

—Beavers are beginning to multiply in Canada, after having been nearly exterminated for many years.

—The woods in San Juan county, California are perfectly

other lakes and ponds another year. The salmon at Sebago are very large, averaging double the size they do in the eastern part of the State. They vary from six to seventeen pounds. They are of a bright silver color, with very few large black spots on the sides near the back, so nearly resembling the grilse that the difference can hardly be perceived. The land-locked salmon at Sebec and in the Scoddic waters are identical, varying only in size. When hooked they spring from the water three times their length, and are as gamey as the sea salmon.

Sebago Lake is situated fifteen miles from Portland. The Ogdensburg R. R. runs past it. The salmon a few years ago were very plenty there, but owing to reckless fishing have decreased very fast. They begin to run up the streams the first of September and continue to do so till they spawn, which is in October. They also run up in May, about the fifteenth, and stay up about two or three weeks.

There is a State law to prohibit taking trout and land-locked salmon from the first of October to the first of February.

To reach Sebec Lake and other points in that section, go to Bangor; from there take the European & North American R. R. to the different lakes and streams. Hiram Leonard, of Bangor, (Rod Maker), and by the way not to be beat in that line, has thrown the fly in all sections in that part of the State, and is always willing to give anglers all the information desired. He is now at Sebec Lake preparing to take spawn of the land-locked salmon for the States of Massachusetts, Connecticut, and Maine, to distribute in her waters

H. O. Stanley, one of the very efficient Fish Commissioners of Maine, to whom we are indebted for many favors, writes at recent date:

"I am somewhat extensively engaged in fish culture, outside of what I am doing for the State. I have a hatching-house here at Dixfield, where I hatched 150,000 salmon for the State, and turned into the Androscoggin river this season, and am expecting to increase the amount the coming year. I have also just established a large hatching house (in company with Mr. George Shepherd Page and George O. Hayford) at Bemis' Stream, on the Mooselucmeguntic Lake, one of the Rangely chain of lakes, where we intend to take hundreds of thousands of spawn from the finest trout in the world. We shall hatch and turn into the lake twenty-five per cent. of all we take. Shall also hatch a large amount of land-locked salmon and turn into the lake. The balance of the trout eggs, after turning in twenty-five per cent., we shall sell at a very low price to any one wishing to stock other waters."

—We are in receipt of the following letter from D. H. Fitzhugh, Michigan, a gentleman who has been chiefly instrumental in identifying the American grayling and adding it to our list of "game fish:"

BAY CITY, Mich., Augus. 24, 1873.
I have just returned from the "Au Sable," whither I was accompanied by a young Norwegian, who is here looking at our pine lands, a proficient in "the gentle art." I went to try the grayling. We found capital fishing. Each taking a light flat-boat, with a man to manage it, we fished up and down two or three miles of open river, taking 220 fish averaging, when cleaned, half a pound each. The heaviest fish weighed two pounds.

—A private letter from Harrisburg, Pa., says:—
"I am sorry to say that this section of Berks County cannot boast of mammoth fish or game; but there are streams in our county in which fish are abundant, but they are of a common size. The Schuylkill river, which passes through here, has no fish—not even "schnakes," or frogs, as the coal dirt which accumulates in it from the Schuylkill coal-fields, kills them all.

In years gone by, shad and all other kinds of fish were plenty in the river, but the poor quality of the water exterminated them all. The fish laws are very stringent, and are rigidly enforced. We hope, ere long, to catch "big fish" again in the streams and rivers around here."

On the 4th of September instant, Seth Green received a shad which was caught in company with others at Tidioute, Pennsylvania, on the Allegheny River. It was thirteen inches and a half long and well developed. These fish were no doubt the offspring of the lot of shad which to the number of 25,000 were taken from the fish works on the Hadson, and deposited in the Allegheny river at Salamanca, by Mr. Green, on the 30th day of June, 1872. They were sent to the Allegheny by request of Prof. Baird, United States Fish Commissioner at Washington, who was engaged in the work of stocking the Mississippi with shad by planting them in its tributaries.

The shad that was sent to Mr. Green is about the size it should be at the age of fourteen months. Tidioute, the place where it was taken, is about sixty miles below Salamanca, and these shad were doubtless making their way to the place where they first found a home in the river. It is probable that they had been down the Mississippi, and true to the habit of their kind, were returning to the place of their nativity so far as they were able. If shad will live in the Mississippi and its tributaries, to the age and size of these, the experiment of stocking these waters may be regarded as successful.

—John Foord, Esq., of the *New York Times*, who has just returned from a tour of the lakes, reports game in upper Wisconsin as being remarkably plenty. In Oconto county, near Lake Noqueba, the deer were abundant.

—Some gentleman in Scotland has a big fish in a loch, which he wants to catch and cannot. Mr. Buckland thinks it is a monster pike, and advises the use of an ingenious bait, which is worth trying, for our muscalonge, he says make an imitation of a water-rat out of worsted. Put two small black buttons for eyes, and boot-laces for the tail.

—A shark nine feet long, of "a lovely sky blue tint," and weighing 475 pounds, was caught in San Francisco Bay a few days ago, and will be stuffed and sent to Vienna.

—Codfish, so enormous as to attract remark, are selling in the fish-market at Halifax, N. S.

—A schooner arrived at Halifax last week, so infested with bed bugs, that the authorities impressed a steam-water boat into service, and after two hours' scalding with boiling water, succeeded in cleansing the vessel.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

—The New York Yacht Club held a meeting last week, Rear Commodore Kingsland in the chair.

Mr. Colgate moved that the Regatta Committee be authorized to carry out the instructions of the Commodore's letter in regard to the October races. Carried.

On motion of Mr. Chase the Secretary was added to the committee.

It was moved to appropriate \$1,000 to defray the expenses for the October races. Carried.

A letter from the Treasurer, Mr. Sheppard Homans, was read, calling attention to the fact that interest on bonds of the club will be payable on demand, at his office, 250 Broadway. The meeting then adjourned.

The following are the prizes to be sailed for at the October races:

Cups presented by the Commodore, one for schooners and one for sloops, to be sailed for on the first Thursday in October, over New York Yacht Club Course: value, \$500.

Cup, presented by the Commodore, to be sailed for on the second Thursday of October, by schooners of any organized yacht club, from anchorage off Owl's Head to and round Lightship off Cape May, and return to Sandy Hook Lightship; value, \$1,000.

Purses, presented by the Commodore, to be sailed for on the second Thursday of October (under the direction of N. Y. Y. C.), by pilot boats, working schooners and smacks (schooners), sailing from any port in the United States. The first vessel arriving to take a purse of \$1,000; the first boat arriving of each of the other two classes to take a purse of \$250. No class, however, to win more than one prize.

Further instructions in regard to the races will be issued by the Regatta Committee from time to time. Any person desiring to enter their boats or wishing any information can address Mr. Charles Minton, Secretary, No. 26 Broad street.

—The Boston Yacht Club held their sixth annual regatta on September 12th, off Castle Island. It would have been impossible to have selected a finer day, and the first class yachts had a grand time of it outside, as they turned the stakeboat in splendid order, the schooner yacht Fearless taking the lead, and proved the winner. The celebrated yacht America was tendered by General B. F. Butler, the owner, as the judges' boat. The regatta was unusually interesting. The winning boat in the first-class schooners, was the Fearless—time, 2h. 50m. In the second-class schooners, the Mercury was the first. Time, 1h. 26m. In the first-class sloops (keel), the Mary Ellen was the winner of the first prize—time, 1h. 22m. 24s. In the second-class, sloops measuring less than 26 feet, the Rebie was the first boat—time, 1h. 16m. 24s.

—The South Boston Yacht Club held their third and last regatta this season, September 11th, over the same course as in previous races. The first prize in the first-class, was won by Kelpie. In the second-class, Queen Mab won the first prize, and Ripple the second. For the second prize in the first-class, Starlight was the winner. In the third-class, the Maud is the winner of the first prize. Another trial is to take place for the second prize. The wind was light, from the southeast, and the yachts carried all their light sails when in favorable parts of the course.

—The Royal Halifax Yacht Club match is settled, and will take place on Friday, September 19th, when the Squirrel, Whisper and Petrel, will sail to Sambro Light and back. These yachts are the fastest sailers in the squadron, and will afford an excellent opportunity of testing their relative merits and speed, as the distance is a long one. The proposed stakes is a cup to cost \$100, to be provided by the two losing yachts.

—The Brooklyn Yacht Club has at present seventy-three yachts, composing twenty-one schooners and fifty-one sloops. It was organized in 1857, and incorporated in 1864. The fall regatta will take place in October; the date is not yet decided on. The election of officers takes place at the annual meeting in January next.

—The Yacht Sphynx, of Toronto, capsized in the gale on Lake Ontario, on Friday, and drowned three men.

SARATOGA LAKE, SEPTEMBER 11.—The grand amateur regatta on Saratoga Lake is proving without exception the best managed out-door pastime that has ever taken place in this country. Even the losers did not complain. The weather was delightful, and the wind died away toward the start. There were ten entries for the single scull race. Distance one mile and return.

C. R. Courtney.....	Union Springs.
T. R. Keator.....	Harlem.
H. S. Traux.....	Potomac.
Robert Leffman.....	Atlantic.
F. E. Yates.....	Grand Haven.
W. H. Hughes.....	Friendship.
James Wilson.....	Beaverwyck.
Charles Pipenbrink.....	Mutual.
A. A. Graves, Jr.....	Beaverwyck.
M. J. Fenton.....	Mutual.

The signal gun to get into line was fired at three o'clock precisely. The start was an excellent one. Wilson appeared to get off a trifle the quickest; but Yates, Courtney and Keator soon follow and bring their boats up to his line. Courtney puts more steam on, but does not increase his stroke, and takes the lead. Keator takes the second position. Wilson is not rowing as well as he does on his own waters. Courtney is now pulling forty-two strokes to the minute and gaining at every stroke, and he turns the stake

boat and crosses the line a winner in fourteen minutes and fifteen seconds. Keator second, Yates third, and Wilson fourth.

The pair-oared shell race came next. Two entries, Nassaus of New York, and Argonauts of Toronto. Distance one mile and return. Commodore Brady fires the pistol, and they start off well together. Johnson and Brown (Nassaus) pulling 42, the brothers Lambe (Argonauts) pulling 43. For the first quarter of a mile, the two crews are a-beam. The Toronto men rounded the stake boat ten lengths ahead of their opponents. The Nassaus are pulling vigorously, they are out-rowed; and the Lambe brother's, pass the judges boat in fifteen minutes four seconds. Nassau crew in sixteen minutes, fifteen seconds.

SARATOGA LAKE, September 12th. The weather on the second day of the grand amateur regatta was even more delightful than on the previous one. The first race was the single scull race, for all who have never rowed for a championship cup, and was started at three o'clock precisely. There were seven entries. Distance one mile and return.

F. E. Yates.....	Grand Haven.
T. R. Keator.....	Harlem.
A. A. Graves, Jr.....	Beaverwyck.
J. H. Girvin.....	Beaverwyck.
B. B. Haasey.....	Cincinnati.
J. C. Sweeney.....	Friendship.
Robert Leffman.....	Atlantic.

All the men started with the exception of Leffman, and had taken their positions promptly after the firing of the last gun. The start was evenly made, Keator, Girvin and Yates taking the lead. Cincinnati drew out of the race. Sweeney capsized. Keator maintained his lead and kept it throughout the race, and came in a winner in sixteen minutes, twenty seconds. Graves second, Girvin third.

The second race was for double sculls; three entries, two of which came to the start.

Argonaut.....	R. Lambe, of Toronto.
	H. Lambe, of Toronto.
Beaverwyck.....	James Wilson, of Albany.
	W. R. Hills, of Albany.

The Beaverwycks and Argonauts were in line. The start is given, the Albanys drawing ahead, pulling thirty-six, while the Argonauts are losing at thirty-eight strokes to the minute. When the Canadians spurt, the Albany men do the same; the Argonauts put on the steam and the Beaverwycks fall a length behind. The boats make direct for the same stake boat, and a foul is imminent. They don't touch, are round it and off for home. The Toronto boat now pulls right away for the Beaverwycks, leading them six lengths, and eventually pulls across the bow of the Albanys and come in winners after a magnificent race. The Argonaut Crew of Toronto, Hand R. Lambe, made the two miles in fourteen minutes, thirty-five seconds. The Beaverwyck crew of Albany, in fourteen minutes, fifty seconds. The third, a four-oared race, was the most interesting of the day. There were six entries. The following is a list of the four-oared crews:

Cincinnati.....	D. Brown, stroke.
	J. W. Kirk, 3.
	H. Keylish, 2.
	K. B. Hauser, bow.
Duquesne.....	F. Brennan, stroke.
	S. Moody, 3.
	G. Scharf, 2.
	J. Straub, bow.
Argonaut.....	F. C. Eldred, stroke.
	M. Phillips, 3.
	B. Stephenson, 2.
	Edward Smith, bow.
Beaverwyck.....	T. Gorman, stroke.
	R. Gorman, 3.
	D. Doncaster, 2.
	James Wilson, bow.
Ballston.....	J. Smith, stroke.
	S. C. Medbury, 3.
	A. J. Reid, 2.
	J. N. Ramsdell, bow.
Potomac.....	D. Caughlin, stroke.
	Z. T. Carpenter, 3.
	A. J. McBlair, 2.
	H. S. Truax, bow.

The start was very equal, the Argonaut and Duquesne in about the same style. Cincinnati, showed well in the front. Beaverwicks and Ballstons got off together; the Argonauts took a decided lead at the start, leading Duquesne by about half a length. After about six lengths had been rowed, the Potomac crew spurted, and barely scratching past the Ballstons' boat gave them their water. Instead of pulling straight ahead, as every one expected, they kept their diagonal course, and a foul with the Beaverwyks seemed inevitable. It did not come, however, for, by a wonderful effort, Truax, the bow of the Potomacs, ran his boat alongside of the Beaverwycks. After a good deal of trouble they got off again safely. The Argonauts made a good spurt at the half mile, but Duquesne soon passed them and secured the lead. Duquesne turned the stake boat first, the next three following fifteen seconds behind. The Argonauts made a good race of the last half mile, but could not get any closer to the Duquesne men. Pittsburg men were leading by six lengths and swept past the judges' boat in twenty minutes fifty-five seconds. Argonaut crew followed, their time being twenty minutes fifteen seconds. The prizes were presented at the Town Hall, a great number of ladies being present. Charles Courtney, of Union Springs, was awarded the diamond single-scull badge, the Lambe brothers the pair-oared and double scull prizes; T. R. Keator, of the Harlem Rowing Association, the badge in the junior scull race, and the Duquesne Clubs' four-oared crew of Allegheny, Pennsylvania, the grand challenge cup and four goblets.

—The annual review of the Schuylkill Navy took place September 13th, on the Delaware. The crews presented a very creditable appearance. The eight-oar shell of the West Philadelphia crew, in passing through the locks at

Fairmount. was crushed to atoms by a canal-boat running against it. No one was injured.

—The single scull race between E. Losee, of the Atlanta, and Roche of the Nautilus club took place September 15th, on the Harlem river course. Losee had the New York side, and Roche the Westchester side. They both got off pretty evenly, and it was very closely contested until turning the stake boat. On the home stretch, approaching McComb's Dam, Losee spurted and forged ahead of Roche, which lead he maintained, and finally came in the winner, some 150 yards ahead. Time, twenty-three minutes and thirty seconds.

—All the requirements in the articles of agreement between John Biglin, of this city, and George Brown, of Halifax, N. S., have been complied with, and Biglin has left for Nova Scotia. The race is to be five miles, for \$1,000, to take place at Halifax next Saturday, the 20th inst.

—The Palisade boat club of Yonkers, on the Hudson, has challenged the Vespers boat club to an eight-oared barge race.

—The following are the leading rules adopted to govern the regatta of the "National Amateur Oarsmen," to be held at Philadelphia, October 7th. The expenses of the regatta have been guaranteed by the Philadelphia clubs, with an additional donation of \$200 to the prize fund. Clubs in all parts of the United States will be represented. The prizes to be awarded will consist of cups and money.

First—No clubs but those which have subscribed to the rules of boat-racing, and the definition of an amateur oarsman adopted by the National Convention, and have agreed to recognize the decision of the Judiciary Committee thereon, shall be entitled to compete. Entries of individuals will not be received.

Third—Any club intending to compete for any of the prizes, must give due notice to the secretary of the regatta on or before the day appointed for closing the regatta. Entries shall close two weeks before the date of the regatta. In all cases of entries for four oared races, a list of not more than eight names, and in all cases of entries for four-oared and double-scull races, a list of not more than four names shall be sent to the secretary, and from those names the actual crew shall be selected. The names of the captain and secretary of each crew or club entering for any race, shall be sent, at the time of entrance, to the secretary. A copy of the entrance list shall be forwarded by the secretary, to the captain and secretary of each crew or club so duly entered.

Eighth—Entrance money for each boat shall be paid to the secretary at the time of entering, as follows: Four oars, \$15; pair oars, \$10; double sculls, \$10; single sculls, \$5.

Ninth—All races shall be mile and a half heats, straight away.

Seventeenth—The laws of boat-racing, established by the National Convention of Amateur Oarsmen, shall be observed at this regatta, and the definition of an amateur oarsman established by said convention shall govern the qualifications of each competitor.

We define an amateur oarsman to be one who does not enter into an open competition for either a stake, public or admission money, or entrance fee, or has not competed with or against a professional for any prize, or who has never taught, pursued, or assisted in the pursuit of athletic exercises as a means of livelihood, or who has not been employed in or about boats or in manual labor on the water.

—The following entries for the International Regatta at St. John, had been made up to our latest advices. We shall have a full report of the affair in our next issue:

FIRST CLASS FOUR OARED RACE.

"C. McCarthy"—Longshore Club, Portland, Me., blue.
 "St. John"—Paris crew, pink.
 "Xiphias"—Indiantown crew, white.
 "John Goddard"—McLaren crew, red.

FIRST CLASS SINGLE SCULL RACE.

John A. Biglin—(no name).
 Alex Brayley—"J. Clark, T. T."
 George Lovett—"Robert Hewett."
 Robert Fulton—"A. C. Smith."
 Doyle—"C. O'Harris."

FOUR OARED INRIGGED RACE.

Logan crew—"Crown Prince."
 Lower Cove crew—"Dexter."
 Morris Boys—"Neptune."
 Pleasant Point crew—"Walter Brown."
 A. Harned—"The Volunteer."

PAIR OARED RACE.

"Robert Bustin"—John Loman and J. Till.
 "Dexter"—Lower Cove pair.
 "Ben Lomond"—C. H. Wright and Robert Stackhouse.
 "Brothers' Pride"—Hugh and Charles McCormick.
 "Katy Did"—R. S. Inch and D. McKellar.
 "Isaac Craig"—Frank Nice and James Pollock.

SINGLE SCULL RACE FOR PRIZES GIVEN BY HIS EXCELLENCY THE GOVERNOR GENERAL, AND THE CHAMPIONSHIP OF NEW BRUNSWICK.

"R. Dalton"—Hugh McCormick.
 "A. C. Smith"—Robert Fulton.

—The Oneida Boat Club, of Jersey City, held their fourth annual regatta September 13th. The course was from Pleasant Valley dock to the dock of the Chemical works. The first race, single shells, was for the championship of the club and a gold medal. There were five entries, three of which came to the starting point. Henry took the lead and maintained it throughout, winning in fourteen minutes and twenty seconds. Schanck came in second. The second race was for the working-boat championship and club badge, over the same course. There were three entries, rowing with a strong tide. Ockerhausen won in twelve minutes and twenty-eight seconds; Gregory second. The third race was an eight-oared race between the heavy and light weights of the club. The start was good, the light weights in the barge Oneida, a new boat built by George Roahr, having the outside. Within the first mile they took the Hudson's water, and gradually increased the gap until, in passing the pier, at the finish, they were fully five lengths ahead, the time being: Oneida, eleven minutes and thirty seconds; Hudson, eleven minutes, fifty seconds. The regatta was in every way well conducted and satisfactory. C. A. McCready, of the Athletic club of New York, and E. R. Pinkney, of the Harlem Rowing Association, acting as judges, and C. A. Peverelli, of the *Aquatic Monthly*, as referee. Fully 1,000 persons witnessed the race.

—The Athletic rowing club single scull shell race for a gold badge, took place September 13th. Distance one mile

The contestants were C. H. Cone and R. W. Rathbone. They started off well, but before going half the distance Cone fouled Rathbone, which was claimed and allowed.

—The Portland Me., Yacht Club regatta takes place to-day. They start from the harbor and return. In the club they have twelve yachts, comprising four schooners, aggregate, o. m. 160 tons; and eight sloops, aggregate o. m. 120 tons. The club was organized in 1869.

Military News.

The Militia, or more properly speaking, the National Guard of the various States, is an important auxiliary to the Army, and it has long been a matter of surprise, particularly since the close of the war, that some measures have not been taken by the several States to organize on a uniform basis or a basis similar to that of Canada, their militia force. The late civil war truly showed the evil results of this neglect, and the time may come again when the United States will find its little army of some 30,000 men as inadequate for the purpose as it was thirteen years ago. The militia, as represented in many States prior to the war, was in public estimation of little account beyond the annual play-soldier displays, and the so-called "training days" of the Eastern States only tended to place them in a still more ridiculous position before the public. The old time militiaman with his poppinjay-like uniform and gorgeous trappings, was really, in appearance, no subject for war it is true, but it was this very spirit and national pride, which afterwards in the real service made many good soldiers. The National Guard is to the country or its volunteer soldiery, what West Point is to the army, and for that reason should be organized by the various States on one plan, as a school of instruction for citizen soldiers or volunteers, upon whom the country in time of war mainly depends. Why, the least knowledge of the drill, at the beginning of the war, placed men forward as leaders of the thousands of raw and entirely undisciplined troops, who at that time flocked from the farm and workshop. The Seventh of New York, of course like many regiments of the National Guard, was before the war, looked upon as first-class "play soldiers," and there are some people still who regard them in the same light. Yet be that as it may, the records show that from the ranks of this very regiment, 640 officers were furnished to the volunteer and regular service during the war. Let us then have a uniform militia law, and let Congress see that this land is never again so entirely unprepared for war, as it was in 1861. This alone can be accomplished in view of the expense and popular objection to a large standing army, by a good and somewhat capable militia system similar to that of Canada. The National Guard, as far as organized in many of the States, is superior in discipline to the volunteers of either England or Canada.

—The American civil war has, since its close, developed perhaps more romance than any other war of modern times. The peculiar character of the conflict was unprecedented, and under the circumstances it would have been strange if any amount of incidents and romance did not arise therefrom. A story from the South is to the effect that Mrs. Buckner, wife of General Buckner, the Confederate General, has recently had returned to her a large amount of property which, when the war broke out, she had conveyed to her brother. At the time General Buckner joined the Confederate service, and before his wife joined him, she conveyed the property to her brother under a deed of trust. The young man afterwards married, became a father, and entered the Union service. The question now was, what would become of the property; for in case the brother should die, or be killed in the service, without making a will reconveying the property to his sister, his child would inherit the estate. It appears, however, on the eve of the battle of Sharpsburg, her brother made a will of this character, and in that battle the poor fellow was killed. General Burnside, who commanded the corps in which Mrs. Buckner's brother served, knew of this will, and kept the secret; and after the war informed General Buckner, and the latter, by his aid, was enabled to recover the will, and proofs being obtained, Mrs. Buckner's title was fully established, the fortune saved and turned over to its original owner.

—The noise and bustle about those Alabama claims will, thank Heaven, soon subside, now that the hard cash has at last been deposited in our strong box. Fifteen and a half millions dollars don't seem so much in these times of big figures, yet 15,500,000 in gold would be no light weight to carry around loose in one's pocket. It took, however, but a few minutes for the State officials at Washington to fix this matter finally. We opine, however, there will be no end of red tape before it gets into the hands of the owners of the vessels destroyed by that great Confederate cruiser, the Alabama.

—The late civil war rather made us forget all other American wars as far as anniversary celebrations go. Revolutionary anniversary celebrations, as well as the more recent Mexican war, have of late years become less, and the memories of our late war and the many battles thereof are kept alive only by army, corps, and regimental reunions, and these too, we think, in time will pass from public view and new events, war-like or otherwise, will take their places. Recently, however, after many years of neglect, a disposition has been shown to look after the fortune (no reference to the large (?) Government pension) of the few survivors of the Mexican war of 1846. Many prominent officers of the army and navy, among them Generals McClellan, Hooker, Cadwallader, Burnet, and Sweeney, and Rear Admirals

Boggs and Stringham, took the matter in hand, and on Monday, September 15, in New York city, celebrated the capture of Mexico in grand style, by a military display and grand reception of the veterans, etc. The whole matter was pleasing in its inception, and the result will tend doubtless to revive memories of our former struggles with Mexico, as well as awaken new interest in affairs along the Rio Grande. Who knows but that this resurrection of the memories of a war almost forgotten among the younger generations, may not result in a renewal of the contest. The United States could do a little satisfactory business in the direction of Mexico. A little skirmish in one part might aid in settling some of the weekly revolutions in that direction.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

SPARKLES FROM SARATOGA. By Sophia Sparkle. New York: American News Co.

This book is emphatically just what its title claims—*Sparkles*—and it is full to the overflowing of "overtrue tales," or sketches of life at the watering places. Every one, it is pre-supposed, is aware that every person who visits the Springs goes there for other purposes than to drink the waters.

Our merry friend, Sophia Sparkle, in her racy, truthful sketches of Saratoga, lifts the veil, and allows us to "peep behind the curtain" of this enchanted life. She speaks of Saratoga, and most graphically does she tell us of what the bubble and foam of this aristocratic (?) society is, in a measure, composed.

At our sitting down to review this highly interesting and valuable mirror of life at the Springs, we proposed to give some quotations from the same for the benefit of those who have not seen the book; but we feel that instead of doing this, we should recommend every lady of good sense who has a great desire to go to the Springs, to read this book before she starts, and if she goes, put it in her "Saratoga trunk," as one of the indispensable and necessary articles belonging to the same.

Our own experience of the Springs bears testimony to the usefulness of this work. How hard it is indeed to be a "fashionable" woman? It would seem that our superannuated belles of six seasons must have learned wisdom by this time, but not so. Sophia says: "six years ago, the Widow Dash was a belle of the *beau monde* of Fifth Avenue, and having gently laid away her 'old Latitude and Longitude,' she is still doing Saratoga with her six trunks, and is one of the vainest of the vain in this great Vanity Fair. Chapter VI is devoted to the Widow Dash, and this same Widow has many followers. The 'Saratoga Droop' and 'Kangaroo Hop' and 'Old Bachelors,' as well as many other habits of Saratoga, are simple 'lame ducks,' and under the luminous and scorching rays of Sophia Sparkle's pen, will be known hereafter as a class whom it will do not the least harm in the world not to have an introduction to, if they should visit the Springs.

We hope to hear from Sophia Sparkle again. She has done a world of good in her first attempt at stirring the "Foam."

POLICE RECORDS AND RECOLLECTIONS; OR BOSTON BY DAY-LIGHT AND GASLIGHT. By Edward H. Savage. Boston: Jackson, Dale & Co. J. F. Riday, Subscription Manager, 147 Tremont street.

This is by no means a sensational story of events, as some might be led to suppose from the title, but a sober, chronological history of the principal events occurring in Boston from the time of 1630 down to the later period of 1873. The work is evidently written with the utmost truthfulness in all things, from its beginning to its end. The opportunities of Mr. Savage for seeing things just as they were, either by "day-light" or "gaslight," were such as but few men have during their whole lives. We are quite sure such opportunities never should be had by a great many men who, from some cause or other, wear the police uniform, and carry the police "locust." We do not mean the good policemen. Oh no. Mr. Savage may be truly styled the type of what our policemen should be in all instances—high-minded, honorable men—whose reverence of truth-telling and morality should be synonymous with the word "policeman." What should the word "policeman" signify? *Guardian of the people, defender of the innocent, a man of integrity, high principle and honor.* We are very sorry that we do not find on all the "beats" just this standard of a man.

Mr. Savage's work will be found very valuable as a work of reference, as it goes back two hundred and forty years, and during this time many strange events took place, all of which are faithfully transcribed.

DIGESTION AND DYSPEPSIA. By Dr. Trall. New York. S: R. Wells.

Dr. Trall says, in his introduction, "We are a nation of dyspeptics." Who can wonder at the assertion of this fact; how do we eat, drink, and sleep, without great abuse of our physical nature? Eat we do not, moderately, taking time to masticate, in the most thorough manner, our food. We throw the various edibles before us down, like corn into a hopper; pork, beans, bread, meat, pickles, mustard, and—well, that will do for the food department of any laboring man's dinner. Now, the drinking process is very much like this; cider, water, ale, tea, or coffee, if not brandy or wine, make a portion of almost every common laborer's dinner. This he gets through in say, not one-half to an hour's time, as he should, but in about fifteen minutes at the longest.

Do you wonder that man has the dyspepsia? If you do, we do not. We should expect it as a natural consequence, or that he had an "India-rubber stomach."

One thing, as the Dr. says, is very true. "The American race must arrest its dyspeptic tendency, or die out."

Reader, get this book and read it. It tells you all about this distressing malady. How to get it, and how to get rid of it, if you have it. Go and buy this valuable treatise of life and its greatest blessing—health of body—and by following the precepts laid down in its pages, you cannot fail of having peace of mind.

NEW BOOKS.

The Bazaar Book of Health is a series of semi-medical essays, in which much useful information is given in unscientific, plain, matter-of-fact phraseology. New York: Harper & Bro. We can say of this book, almost any one can read it with profit, and many useful suggestions are given, with illustrative facts, to prove that man has other duties to perform in this world than simply to eat and drink. Man is intellectual and accountable, and though grovelling in his tastes, nevertheless he is an accountable being.

FORTHCOMING BOOKS.

Herbert Spencer's *DESCRIPTIVE SOCIOLOGY*, dedicated to his American friends, is waited for with great interest by his many admirers in the United States. The work will be a gigantic one, and its value, when completed, will be immeasurable. In a subject so vast we can only mention a few of the topics treated, such as "Division of Labor," "Regulation of Labor," "Domestic Laws," "Laws Criminal, Civil and Industrial," "General Government," "Habits and Customs," "Religious Ideas and Superstitions," "Knowledge," "Agriculture," "Weapons," "Habitations," &c., &c.

Art and Drama.

THERE was a time when the opening of a new and splendid theatre occasioned a great deal of excitement in the city. We suppose the remark will be made: Very possibly, but that was when New York was a village. Now it has grown to such metropolitan proportions that a sensation theatrical is impossible. This may be partially true, yet we insist that the inauguration of a temple of the drama of such excellent characteristics as the New Lyceum should have been a more marked event than a mere ripple on the surface of public excitement, to subside immediately into the level of the common-place. The introductory piece was, and is, entitled "Notre Dame," and the plot is morbid and melo-dramatic enough to suit the most enthusiastic disciple of the modern school of playwrights. To give our readers any idea of "how the thing is done" is impossible with language of ordinary construction and use. We are therefore compelled to quote a few paragraphs from what is considered to be the leading theatrical paper of the day. Speaking of the personelle, we have, among other similar descriptions, the following:—"There is the character of Esmeraldi, as beautiful as a clear conscience and as rare, who throws sunlight upon the hideous tragedies around her until her own young life is quenched. There is Jehan, the boy student, for whom existence should have been as harmonious as a hendecasyllable, and as smooth as a rhyme in the metre of Catullus. There is Gudule, whose fate flashes with the blackness of a terrible nightmare through the light and shadow of the romance. And finally, there is Quasimodo, in whom the perfection of the grotesque and the perfection of the horrible meet in chemical affinity," &c., &c.

And to get these impersonations (!) before a West side New York audience, is erected one of the most charming and easily-reached places of amusement in the city, where the audiences are expected to crowd in every night to witness the heroine, beautiful and rare as a clear conscience, quenched in hideous tragedy, while the fate of Gudule "flashes with the blackness of a terrible nightmare through the lights and shadows of the romance!" To conceive that this dainty dish is selected and seriously put on a stage located in the most refined and intelligent part of our city is almost impossible for belief, and to many of our readers the realization of such an event will indeed "flash with blackness" the dispatch that we have another downward slide of the stage. Not a newspaper notice has expressed the least admiration of the performers; they are passed by as mere necessities to get the "gorgeous and unsurpassed scenery in its place." "Miss Lewis," however, calls forth some warm expressions from our critic already quoted. He says this "slender brunette" captivates more by her personal appearance than by her acting or her voice, but she becomes invincible when "threading the dance to the mingled music of the balafones, the tambourines, the goat horns and Gothic rebecs."

All this is really unworthy of serious notice in any paper desirous of sustaining public amusements—amusements which are equal to the intelligence of our people. Our public may be compelled for all time to eat these dishes of "husks" because the managers have found it easier, cheaper, and more to their glory to command scene painters, gilders, and fiends of red and blue lights than draw around them cultured men and women, upon whom God has bestowed genius, and the power to illustrate the various and conflicting emotions of the human heart. We have charity to believe that the proprietors of the Lyceum would do better if they could. The fact that "their opening night" was only moderately well attended, a thing that never before happened on an opening night of any theatre, must have given them some twinges of despondent doubt as to their final success if they persist in running a muck in intellectual wealth against the Bowery in its worst days, and against the "Crook" for scenery in its "Imperial splendor."

The Grand Opera House has brought out and continued on the stage since our last issue the notable melo-drama of the "Wandering Jew." The story is made familiar by the name of Eugene Sue, and our citizens who are maturing into men and women will recall its successful representation at

the Bowery Theatre some fourteen years ago. Of course all that can be done by scenery and costume has been bestowed "in the fitting up" by the enthusiastic management, and yet the audiences are not happy. Mr. Fox, of "Humpty Dumpty" fame is evidently the intellectual hero of the play; what he does has no connection with the piece, but it affords to the thoughtless crowd who witness it an immense amount of amusement for its grotesqueness, and, to the few judicious present, is taken as a running comment of condemnation upon the absurdity of the play. As a contrast, probably, to the aged Jew, who is supposed to have lived nearly nineteen centuries, there has been forced into the piece, in the carnival scene, a large number of dancing infants. In fact, the performance of these little ones occupies almost the time of the third act. These infants receive a great deal of applause, but how mothers who have left their babes at home to enjoy their natural sleep can otherwise than be painfully impressed by the exhibition is difficult to imagine.

At Robinson Hall, West Sixteenth street, near Broadway, by some very natural but unexpected offering, the legitimate drama is making its way with the public through the means of marionettes, or wooden dolls. Since the decline before the British public of modern theatricals, efforts on the part of ingenious persons have been directed to the construction of mechanical figures, which could by their histrionic powers not only amuse and instruct an audience, but also, possibly, revive a taste for intellectual acting instead of mere scenic display. These dolls are diminutive wooden figures (though not as wooden in their acting before the curtain as most of our living actors), furnished with movable limbs, and are moved by means of cords controlled by unseen hands. They are managed by bright and intelligent people, and their performances are throughout pleasing and unexceptionable. These little creatures, through pantomime, assisted by intelligent and apt dialogues, give almost every human action; in fact, their attention to detail is almost or quite as perfect as the French school. It would be a great benefit if most of the living actors now strutting their brief hour on the stage would go to see these marionettes, and learn something of the true expression of their business. At present the dolls give Punch and Judy, a crippled sailor, and a melo-drama, in which a wicked nobleman is punished. The troupe also includes an Hibernian, who, in some respects, is quite equal to Boucicault in action, and superior to him in the correct brogue. To hear the juvenile portion of the audience laugh their applause and demonstrate their joy with clapping hands and light eyes is worth a dozen prices of admission. We do not know if the report is correct, but we have understood that negotiations are now under consideration for the engagement of the marionettes for the production of a series of plays, including two or three of the best tragedies of Shakspeare, and all the old comedies so popular in the palmy days of Wallack's Theatre. We trust that this will be the case, and possibly our living representations of mimic life will take heart at the success of these dolls and try to imitate them on the stage. The dawn of the era of the legitimate drama possibly opens before us.

The Olympic Theatre has substituted "Sinbad the Sailor" for Mr. Rowe's burlesque of "Mephisto," and we think the change is warmly appreciated by the public. Miss Thompson has now an opportunity of reveling in her peculiar role of the "child-like and bland." Miss Ada Beaumont is nightly gaining in popularity.

The Vokes at the Union Square, in the "Belles of the Kitchen," present really one of the most agreeable entertainments in the city. The sketch of "Micawber" to us is not interesting; it is depressing, and the personation of Uriah Heep, while it is artistic probably to the last degree, is simply a hideous phantom, that makes one feel as if a snake was in his pocket. The "sketch," no doubt, answers its purpose, in making the appearance of the dashing girls doubly agreeable, but we would be content to see the jolly demonstration below stairs first, and leave Micawber and his troubles to go on without our presence.

BROOKLYN.

The entire success of the Park Theatre, under the management of Mr. Samuells,

has already established the fact that a good theatre will be patronized in Brooklyn, and hereafter it would seem that New York is to lose some of the patronage that was justly expected from our neighboring city. The effect has been to give a new impulse to other places of amusement, and the Brooklyn Theatre, under the management of Mrs. Conway, which, without opposition, was allowed to literally "go to seed," opened on the 13th instant with an improved company and the greetings of a crowded and fashionable audience.

DRAMATIC NOTES.

Artists are flocking into the city in crowds, all busy as bees in completing their engagements for the coming season. Among others is Wirner, the celebrated violencellist, who returns to this country after two years' absence in Europe.

Santley, whose name has been mentioned in connection with Miss Kellogg in English Opera, has withdrawn. Frank Bartlett, the ballad singer, is now spoken of as likely to join the troupe.

The engagement of Mrs. Van Zandt, at the St. Petersburg Opera House, turns out to be merely an "unfounded report."

Salvini is possessed of a much handsomer person than his pictures in the various saloons suggest.

Nilsson sang recently in four different languages at the house of the Baroness Adolphe de Rothschild.

We are happy to announce that Jefferson will probably soon appear in a new play. This will be a genuine sensation, and we have no doubt it will prove so to the public. Of his success, who can question it?

A phenomenon has appeared in Paris—a moral drama. The author is Malpertuy.

The Graphic balloon ascension was advertised under the head of "amusements."

Booth's Theatre, heretofore claimed as the home of the legitimate drama, is to be made sensational by the production of the "New Magdalen."

A passion play has been revived at Brigg, a small Tyrolean town, after a prohibition of some five years. At Ammergan the performance was literally in the open air. At Brigg it is performed in a covered building, with seats for 2,500 persons. Great throngs attend. The words and plot are from the Scriptures, followed as literally as possible.

The Union Square Hotel is crowded with the members of the Grand Opera troupe. Many not finding accommodations are seeking quarters in private houses in the neighborhood.

The regular opening of the Union Square Theatre will be on the 30th instant, with a new play by George Fawcett Rowe entitled "The Prussian."

Mrs. James Oates is announced to appear at the Olympic Theatre on the evening of September 20th in modified *opera bouffe*, given in English.

Pliny estimated that Roscius made annually \$20,000, and that the Dancer Dionysia had an income of \$8,200. For the love of his art, for ten years prior to 77 B. C., Roscius played for nothing. Imagine Mr. Booth or Mr. Sothern doing anything of this kind. The Roman stage was then remarkable for its pageants. Cicero says that in "Clytemnestra" no less than 600 mules appeared on the stage, and that in the "Siege of Troy" whole regiments of cavalry and infantry appeared *en scene*. After this all modern "Cataacts of the Ganges," with equine developments, must be considered as one-horse affairs.

The Fishing Tourist, Angler's Guide and Reference Book.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association."

ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who write a book mainly for the reason that they have something to write about—have something to tell the public which the public desires to know. The shortest routes to pleasure are laid down, and correct information is given as to the best means of conveyance, the expense of the trip, the secrets of the commissariat, etc. The author has avoided the use of technical terms, and thus made his volume all the more acceptable.—*Turf, Field and Farm.*

II.**Prime's I Go A Fishing,**

I Go A Fishing, by W. C. PRIME, author of "Boat Life in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vigorous descriptions of scenery and character, is distinguished by a refined wit, a droll humor, a strong love of the beauties of nature, and an enthusiastic devotion to the piscatorial sport. This book will please all who admire heartiness of style and exuberance of animal spirits in their authors. There are some interesting and well-told stories scattered through the volume, which exhibits on almost every page the handiwork of a man of graceful culture and wide reading.—*Boston Daily Globe.*

Published by Harper & Bros., N. Y.

Terms, Five Dollars A Year, Strictly in Advance. A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "FISHING TOURIST," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognized medium of communication between amateurs and professional sportsmen. All of us have something to impart, which if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an imitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a healthful agent or recreative amusement, will be considered and its practice encouraged. Nothing that degrades or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognized throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home," and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even *clamor* for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a live paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

Mr. SIMON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

For Forest and Stream.
SEPTEMBER.

Charmed is my eye to-day,
As cooler breezes play
Around my pathway by this mountain stream;
Not yet has summer gone,
Tho' days have rolled us on
'Till harvest moon through clouds of Autumn gleam.

But lingering with us still,
Her voice among the hills,
With mellow tones of Autumn mingling sweet,
Gently as she glides away,
And gone the summer day,
E're we have missed the music of her feet.

Oh, golden harvest-time,
Ye come with solemn rhyme,
To warn us that September of our life
Shall come to us ere long,
And hush the summer song,
And God shall garner us from every strife.

Oh bright September day,
Fond memory is at play,
Among the many scenes that you recall,
Fresh breezes breathing joy,
Make me again a boy,
And waft away the clouds of sadness all.

Now from the marshy ground,
With merry whistling sound,
The snipe fly up in many a zigzag line—
In vain the wild ducks hide
In reeds by river side,
My trusty gun speaks out and they are mine.

I feel the sluggish blood
Go bounding like a flood
Back to a youthful heart again to-day;
And such a moment's bliss
Is years in world like this.
Oh, could we linger always by the way!
HIRAM E. GRIFFITH.

Down the Potomac.

NO. I---THE WATERING PLACES.

IN the summer months Washington resembles a deserted village. The salary-grabbers, the Credit Mobilierites, the Washington Tammanyites, the plethoric-pursed contractor, the uppermost of Government officials; the designing mammas, with marriageable daughters—in brief, shoddy and the *crème de la crème*—flee from the heat and dust of the Capital to Saratoga, Long Branch, Cape May, the Virginia springs, and other “fashionable” resorts, for change of air, fare, and dissipation. For the thousands whose occupations and purses will not permit of such extravagant pleasures, there remains the Potomac—noble stream that it is—bringing cool breezes to the feverish city, and nourishing in its depths oysters, crabs, and the best of fish. I might tell of the Little and Great Falls, above Washington, and of the black bass fishing, but the caption of these papers forbids. Mine is the pleasing duty to tell of life down the Potomac—of watering places unknown to the fashionable world, but frequented by boating men, fishermen, and people who feel most at home in their old clothes. The Washingtonian who can only spare an hour daily for recreation may enjoy the cool breezes of the river by taking the ferry boat to Alexandria and return at a cost of twenty-five cents for the round trip. He will pass and repass the navy yard, will have glimpses of green hills, shady groves, rippling water, white sails, puffing steam tugs, laden coal barges, a fleet of shipping, and enjoy the while a pure air and delicious breeze. Farther down the river are Glymont and Marshall Hall, accessible by excursion boats and resorted to by picnic parties and yachting parties. Here rum and riot sometime prevail, but there are “select excursions,” which provide their own champagne, and indulge in gentlemanly intoxication by moonlight or otherwise. Of course there are dancing pavillions, and hotels where meals and mixed

brought in with the dessert, we walked down to the wharf, drinks are supplied; and here shad-bakes take place in their season.

Planked shad is a Potomac delicacy, and deserves brief mention, e'en though the last *roes* of summer have disappeared from the larder. *Imprimis*, you draw a seine to catch your shad. As this operation is not always successful, it is well to have provided a supply of fish for the party beforehand. Then you want a roaring fire, and some hard wood planks, planed smooth. These planks are stood against the bank, near the fire, until thoroughly heated. Then the fish, which have been split, nicely cleaned, and sprinkled with salt, are fastened to the planks, which are again placed against the bank, where the fire will cook and nicely brown the shad. May the shadows of planked shad never grow less.

Of the best known summer resorts farther down the river may be mentioned Colton's, Leonardtown, Blackstone's Island, Piney Point, Marshall's, and Point Lookout, the latter a point of land at the mouth of the Potomac, with a splendid beach fronting on Chesapeake Bay. The attractions at all these places are boating, fishing, bathing, crabbing, and a fare composed almost exclusively of fish and oysters. Save at Piney Point, the terms are very moderate—\$2 per day, \$10 per week, and \$30 to \$35 per month. Piney Point was quite a fashionable resort long before the war, and has sometimes, though inaptly, been called the Southern Long Branch. It has fallen somewhat into disrepute of late, partly through the unpopularity of its managers, but largely because of those ravenous pests, the mosquitoes, who are no respecters of persons. The cottages and hotel buildings stand in a grove of pine trees near the beach, and in the rear is a pool of brackish water. This swamp and the surrounding foliage are thought to account for the prevalence of mosquitoes, from which the place is only free when a strong breeze blows up the river. The Potomac at this point is eight miles wide, and a southerly wind creates quite a respectable surf. The beach is somewhat abrupt, and therefore dangerous to those who cannot swim, though I have never heard of any fatal accidents here. The bottom is hard and sandy, but as one occasionally encounters an oyster shell it is advisable to wear bathing shoes. This is the only place on the river which boasts of a tennis alley and billiard table; but of other amusements there is a painful dearth. You may catch crabs and small fish from the wharf, but if you wish to sail you must hire a boat at so much per hour; and during the past summer, for weeks at a time, there were no boats to be had for love or money. There is music and dancing at night, an excellent table, and the arrival and departure of the three or four steamers which ply up and down the Potomac help to dispel the monotony. It will be seen that Piney Point is no place for the sportsman or the lover of aquatic sports. It would be a fashionable watering place if it could, and put on airs, but during the past summer its cottages were for the most part untenanted, and the season was an utter failure pecuniarily.

Point Lookout, according to the distance-table of the steamer *Lady of the Lake*, is 113 miles from Washington, at the mouth of the Potomac river. It is a watering place gone to seed, but a top dressing of greenbacks would soon cause it to blossom forth again, as the place has many natural advantages. A railroad to Washington is now in process of construction, which will not only open up a new country, but tend to build up Point Lookout as a winter port for the shipment of fish, oysters, and produce. The distance by the land route is much less than by the river, and it is expected the journey from Washington to Point Lookout will be made on the railroad inside of three hours. This will enable business men who send their families here for the summer to run down at night and return in the morning, or, at least, to come down Saturday night and remain until Monday morning. But for the check received from the war Point Lookout would to-day be the most prosperous watering place south of Cape May. It had been laid out on a grand scale, and many of the improvements completed. A hotel building had been erected, and

there must have been between three and four hundred one and two-story cottages. Walks, drives, ponds, and fountains appear upon the lithographic plan issued by the proprietors, but of these not a vestige is seen to-day. During the war the place was taken possession of by the Government, and used as a naval station and a prison pen. Whole rows of cottages were burned in wantonness, or torn down for fuel, and as no repairs have been made from that day until this, the remaining buildings are in the last stages of dilapidation and decay. The hotel building is barely habitable, and a two-story villa is in a fair state of preservation, though nearly undermined by the waters of Chesapeake Bay, which now wash up under the verandah; but the remaining cottages are leaky as sieves, and ready to tumble down. The property was sold for taxes during the war, and bought by a Miss Baker, a hospital nurse, and one of the strong minded. It is said she bid in the cottages at \$1 apiece. This sale has been the cause of litigation ever since, and has prevented any improvement or repairs. Believing possession to be nine points of the law, Miss Baker has lived on in the main building, dragging out a precarious existence by the rent of a cottage or two, and the “taking in” of an occasional guest.

I shall never forget my first visit to the place, a little more than a year ago. The original wharf has nearly disappeared, and one constructed by the Government during the war, now used for the landing of passengers, is rotten as punk, full of holes, and tottering to its fall. Yet upon this dangerous and rickety structure our party of five—two ladies and three gentlemen—was landed between twelve and one o'clock one dark night. That we reached the shore in safety was little less than a miracle. Then, heading for a twinkling light in the distance, we walked ankle deep in sand for a quarter of a mile or more, and entering a door in a barn-like structure, which loomed up through the darkness, found ourselves in a large, dimly-lighted room, which we afterward learned was the dining-room. Here we met the hostess, a gaunt, weather-beaten woman, in a dark dress, which clung closely to her angular figure, and barefooted. After some delay, a lantern was procured, and we were marched up stairs to our sleeping apartments. The first couple were assigned a room, and given a candle, stuck in a goblet, to light them to bed, and there remained another couple and the writer to be disposed of. We were finally given a suite, and, the inner room containing a double bed, the outer of course fell to my lot. The furniture of these rooms was of the simplest description. The inner room contained, beside the bed, a chair and an eight by ten mirror, and the outer a single bed and washstand. But one candle could be obtained for the party, and in undressing by the light which shone through the transom I hung my clothes on the floor and went to bed. In the morning, after performing my ablutions, taking care to use but one end of the solitary towel furnished, I passed the washstand into the next room and received the mirror in return. At breakfast we were waited on by the hostess herself, still barefooted, and the cook, who wore an apron filthy beyond description. The bill of fare comprised some scraps of cold fish, a dish of chicken legs, and a cold decoction of chickory. Asking for a glass of water, we were told there were no glasses (they were all in use as candlesticks); but on insisting some tepid water was brought in a teacup. During the morning we went in bathing, and though assured there were no sea-nettles in the vicinity, our party were all more or less badly stung by them. An application of fresh water is said to furnish instant relief, but this remedy being then unknown to us we used sweet oil, without any perceptible benefit. The beach is certainly a fine one in many respects. It slopes down very gradually—indeed, one may wade half a mile from shore—and there is of course very little undertow. The bottom is hard and smooth, but one frequently encounters oyster shells, which cut the feet severely. An expert swimmer would find little pleasure here, but for women and children the bathing is excellent. After a dinner of chicken legs (there must be a peculiar breed of chickens hereabouts) and some cold chicken soup, which was over which we had made the perilous passage of the night

before, and amused ourselves opening oysters with spikes and penknives, a small boy providing us with all the bivalves we wanted by wading a short distance into the water. One day was enough for us at Point Lookout, and after a farewell repast of chicken legs we took the steamer up river that night. During the past summer there have been perhaps half a dozen families at this place, occupying the villa and the most habitable of the cottages, but they brought with them from the city furniture, provisions, and all the requisites for housekeeping. Fish, oysters, and crabs may be had here in abundance, but everything else must be brought from Washington or Norfolk. The fishing here is said to be much better than at any of the points above, and particularly for sheepshead. Occasionally a sea turtle is caught. Last year two men, while fishing from a canoe, hooked a turtle which towed them across the Potomac to Cone river before they could secure it. It was finally captured and sent to Washington, and when killed weighed 350 pounds.

The most popular resort on the Potomac at this time is Marshall's, two miles below Piney Point, and one hundred miles from Washington. Until this year it was little known, save to sportsmen and a few persons who value comfort and independence more than fashion. The accommodations were somewhat limited, consisting of a two-story and a half dwelling and country store combined, and a cottage with two rooms. This year a large three-story building was erected, and a steamboat wharf built, and the place is now known as the St. George's Hotel. The buildings are directly on the St. George's river—more properly an inlet—which extends four miles above, and three miles below unites with the Potomac and St. Mary's rivers. The Potomac is in full view, and but a quarter of a mile distant across the tongue of land on which the St. George's Hotel is situated. At the end of this point, less than half a mile from the hotel, are the Straits, a shallow strip of water between the main land and St. George's Island, through which canoes pass in going to Piney Point. But for this passage they would be compelled to sail entirely around St. George's Island, a distance of ten or twelve miles. I have been thus particular in describing the topography of the place from reasons that will appear later. The surrounding waters are everywhere shoal near the shores, and are filled with oyster bars, which are often encountered in the most unexpected places by sailing parties. Oysters are found in every direction, but those used at the hotel are brought in canoes from the St. Mary's river, and delivered alongside the wharf for ten to fifteen cents a bushel. They are measured and thrown overboard, to be tonged up when required. Half a dozen canoes lay at the wharf for the use of the guests, and a colored man is always to be had to sail them. No extra charge is made for the use of the canoes, nor for the raw oysters, of which one may eat a fill at any time from daylight to dusk. Indeed, there are no extra charges for anything, your dollar a day (if you stay more than a month, otherwise \$35 per month) covering all necessary expenses. A blue shirt, an old pair of pants, a broad-brimmed straw hat, such as may be had in the store for thirty cents, is *en regle* for costume, a coat being essential only when you go to the table. A Saratoga trunk is therefore unnecessary, a good sized valise holding all that is required in the way of outfit. You will rise in the morning not later than sun-up, and take a bath in the tubs or tanks at the end of the wharf. These are perforated boxes, which may be let down to any depth required, giving you all the benefit of a buff bath in the salt water without coming in contact with the sea-nettles. After your bath you will find your way to where two or three colored men are shucking oysters for the kitchen, and eat a dozen or more of the bivalves just from the water. It is then time to dress for breakfast, which meal will consist of whatever panfish have been taken by the fishermen in their gill nets the previous night—spot, croakers, small rock, or taylor—stewed and fried oysters, fried chicken, hot rolls, corn bread, waffles, and an abundance of milk. After breakfast nearly everybody adjourns to the summer house, midway on the slender wharf, at the end of which are the bath-houses. Around it the canoes are moored, and here the sailing parties are made up. Some of the ladies, who dare not venture farther on the raging St. George, will seat themselves with a book, newspaper, embroidery, or crochet work, and watch the children crabbing. Their outfit for this sport is very simple, and success certain. Having procured a chicken's head from the cook, it is tied to a string, weighted with an oyster shell, and thrown overboard. It will hardly reach bottom before it is seized by one of these voracious crustacea, and often with so firm a hold as to be drawn upon the wharf. A net with a long handle is necessary, however, with which the crab is dipped up as he nears the surface and dropped into a box or barrel for transportation to the kitchen. This is fine sport for the children, who can sit in the shade and catch crabs until they tire. Albeit, these shell fish have been both scarce and small this year, a fact which no one was able to account for. The soft crab, a great delicacy, must be sought for at low tide, on a shady shore, among the tufts of sea grass. Here it lies helpless, and is picked up by the fisherman as he wades along with observant eye. These not only furnish a favorite dish for the table, but bait for all the Potomac fish except the sheepshead.

Between twelve and one o'clock, the ladies having had their baths, a crab and oyster lunch is in order. This is partaken of under the boatshed, on the shore. The crabs are sent down on a large tray, with condiments and soda crackers, and a colored boy brings a basket of oysters. The work bench or an old boat serves for a table, and all

fall to *sans ceremonie*. Then a siesta. For dinner there will be oyster or chicken soup, boiled and baked sheepshead, oyster pie, chicken, duck, and goose, and a dessert of peaches and cream. After dinner the canoes will be in requisition again, and the croquet balls set in motion. For supper there will be cold fowl, stewed oysters, ham, cakes, and milk *ad libitum*. Soon after supper dancing commences, and is kept up until midnight. Such is a brief outline of a day's doings at the St. George's Hotel.

The facilities for sailing are unsurpassed. If the waters of the Potomac are too rough to venture upon, there is the more quiet St. George's. You may go for miles inland, with little coves branching off on either hand; here a comfortable farinhouse and there a negro cabin; here an orchard and there a tobacco patch. Or you may go down the St. George's three miles, and rounding a point known as Cherryfield, enter the St. Mary's river, and visit the old colonial city of St. Mary's, where landed the first settlers of Maryland. The St. Mary's is three miles wide at its mouth, but soon narrows, only to branch off in various directions into inlets, which furnish scenery of the most charming and picturesque description. It is considered quite an expedition to sail around St. George's Island, but by far a pleasanter one to land and visit a Captain Adams, whose garden and orchard contain the best of fruit. Here may be had figs, peaches, plums, pears, nectarines, melons, and apples in the greatest abundance, and at trifling cost. A party of four ate all they could on one occasion, and went away laden down, at a cost of only twenty-five cents.

Another favorite sail is to Piney Point, distant one and a half miles by land, but nearly three miles by water. The course is down the St. George's to the Straits, on opening which the Piney Point lighthouse comes into view. Once through the straits it is plain sailing, but the navigation otherwise is somewhat difficult, and the inexperienced hand is apt to run his canoe hard and fast on an oyster bar. Sometimes he may push off with his steering paddle, but oftener he will have to jump overboard and pull his craft into deep water. On "steamer nights" parties are made up to go over to the Point to greet the new arrivals or speed the parting guests. The boat is due on her down trip at ten P. M., but on her up trip not until midnight; so that while in one case everybody is home again before twelve o'clock, in the other it is sometimes one, two, and three A. M. before all is quiet on the St. George's.

Twice a week the steamer Lady of the Lake lands a mail punctually from Washington at Piney Point, and it is brought over by wagon to Marshall's, this being the post office. No sooner is the rumbling of the wheels heard than the parlor is deserted, and everybody rushes for the store. The mail-bag is emptied upon the counter, Mr. Marshall dons his spectacles, and seizing upon the letters calls off the names amid a terrible din and confusion. Envelopes are hurriedly torn open, messages shot to and fro, exclamations of satisfaction or regret uttered, and then the letters having been disposed of, the newspapers are in order. The most momentous news is, however, of secondary importance to a "Letter from Marshall's," and this I have found to be the case at every watering place I have visited. Let them say what they will, people do like to see their names in print, and to have it known that they are "out of town." Woe unto the watering-place correspondent who ignores this craving for newspaper notoriety. Even the indolent Bohemian, bent only on taking a respite from quill driving, is not safe from the assaults of neglected fair ones, but is waylaid in verandahs and besieged in his cottage, as the writer can testify. Of course we had a Mrs. Grundy among us, but she tarried not long, and, on the whole, a nicer, jollier, happier set of people than were congregated at the St. George's Hotel last summer it would be difficult to find.

I had intended deferring what I had to say concerning the fishing until another issue, but there is so little to be said that it may as well be said now. Up to the 1st of September the fishing had been exceptionally poor. In June two young lads struck a school of rock, and, with soft crabs for bait, took forty pounds in a short time. There was no line fishing after that worth mentioning until about the 1st of August, when a fine string of white perch was taken in the mouth of a cove on the St. George's, a mile above Marshall's. All through the summer, however, the regular fishermen were bringing in sheepshead daily, with occasional intermissions. Seven was the highest number caught in one day by one man; two or three being the ordinary catch. The sheepshead are caught at Sheepshead Rock, a mile or so above Piney Point, and in huddles, or hurdles, at the lower end of St. George's Island. The bait used is a species of clam known as the man-nose. The hurdles are small enclosures formed by driving poles into the bottom, the bark being retained. The theory is that the fish feed on this bark. There must be a depth of water not less than ten or twelve feet, and a rocky or gravelly bottom. Hand lines are used, and when a fish is caught a small cord is made fast through the gills and attached to the boat. They are thus towed to a market, and when purchased are tied to the wharf to swim about until required for the table. The price paid the fishermen last summer was fifty cents a piece for sheepshead, large and small. They are sometimes taken weighing twenty-five pounds and upwards, but the average of the past season would hardly exceed ten pounds. The fishermen complain that the gill-nets in use lower down destroy the fishing in this vicinity. This is no doubt true, and moreover, the fishery laws of Maryland are frequently and openly violated along the Potomac by boats from the Virginia shore. The penalties are severe, but no captures are made, and the illicit traffic goes on.

A word should be said of the taylor, to my taste the best

fish taken in these waters. It may be taken with a troll, or with a hand line, soft crabs being used for bait in the latter case. Those who fish for sport, however, prefer to use a cedar pole, without a reel, and to feel the weight of the fish before landing it. Some parties were quite successful in the latter part of August, bringing in from fifty to one hundred good sized fish, but the best fishing is in September. Spot and croakers were sometimes taken with hook and line, but the supply for the table was furnished by the nets.

As for shooting, partridges are very abundant in this region, and later in the season the duck shooting will be good; and occasionally a shot may be had into a flock of wild geese. Of smaller game no note is taken by the inhabitants, and the gunner from the city must find it out for himself.

CHARLES A. PILSBURY.

GROUSE SHOOTING IN INDIANA.

CENTREVILLE, Indiana.

EDITOR FOREST AND STREAM:—

Arriving at the little railroad station of Remington (on the L. P. and B. R. R.), in Jasper County, Indiana, we were met by Joe, who was soon busily engaged in loading our baggage into his big two-horse, covered, spring wagon, said baggage consisting of a soldier tent, centre-pole, barrel of crackers, sugar-cured hams, ten pounds ham sausage, twenty-five pounds of butter, one dozen loaves bread, salt, pepper, one cheese, tobacco, shot guns, ammunition, blankets, &c., and we were soon on our way northward over the broad, green prairie, and our dogs had to run to keep up with our fiery team.

We had scarcely gone three miles from the station, when a prairie chicken (pinnated grouse) whirled away from the side of the road. Shot guns were then got ready, and presently two more went sailing past; but one was brought down, by whom I cannot tell, as we all fired at once, and each claimed that he had hit it. Every now and then our dogs would start one, sometimes half a dozen in a drove, but they were too far off for a shot, and we were anxious to get to our camping-ground. We saw a few sand-hill cranes and ducks, in sloughs, or places where there was water. About sunset we arrived at our camping-ground, a place which certainly did credit to Joe's judgment in selecting it, for it was a nice little grove of scrub oaks and hickory trees, while on the west ran a stream of clear, pure water. He had brought his cooking utensils—frying-pans, skillets, pots, coffee-pots, &c., with him, and in a very short time we had our centre-pole put up, all our traps unloaded, while Dick, the sable cook, had the coffee (Java) made, and we sat down to as good a supper as was ever eaten, at least it required no trouble to clear the table of any remaining fragments. We sat around the camp fire until late at night, smoking our meerschaums, relating stories of former hunting and fishing, and then rolled ourselves up in our blankets to sleep. To sleep? No, for the Major's sonorous snore made it impossible for me to sleep, so I lay awake until nearly midnight, listening to the myriads of katydids in the trees, and the chirp of crickets in the long grass down by the creek; but finally I went into dreamland, and did not awaken until the sun was at least two hours high, when Dick called me up for breakfast. We had some fried grouse, which one of the party had shot that morning, and we all partook.

We then went to work in earnest—six men and four dogs—and as the game was plenty, the dogs had no trouble in finding it, and wherever they pointed we were sure of chickens. We made it a rule not to fire until they had got about thirty yards distant, when we seldom failed in bringing down the game. At noon we had succeeded in bagging forty among the whole party, nine being the largest number shot by any one. We did not go out again until evening, when we brought in seventeen more. Supper, smoke, to bed, and the same snore of the Major's; but I was so tired that I soon slept. Thus we passed the time for five days, killing all the chickens we needed, and occasionally brought in a brace of fat ducks. On the afternoon of the fifth day we removed our camp near to the Kankakee river, but still on the same creek, and in a grove also. During the middle of the day we generally laid in the shade and read or smoked, and did not try to kill any game, except mornings and evenings, nor did we kill any and throw it away, as no true sportsman will do this; but after the first day we killed only what we wanted to eat, and had chicken fried, roasted, or stewed every meal, varied occasionally by a brace of roast ducks. Joe went to a farm house, about ten miles off, and brought back a lot of fine melons.

Sunday, we read, smoked, and slept, and no one thought of taking his gun. We spent five days at this camp, then sung our "parting song," took down our tent, loaded the wagon—not forgetting to take home a half-dozen chickens apiece—and were on our way to the station again, after having killed over 200 chickens, and having ten days of rest and recreation, with a hope and a promise to meet again at this place next summer.

September and the first two weeks in October are more pleasant for hunting than August, as the nights are cooler, although we did not experience any discomfort from the heat, as there was always a good breeze.

Later in the season the game is generally a little scarcer and wilder, but there is always plenty of game. We met parties who had killed many more chickens than we had. I would advise any who go to do as we did, take tent and provisions, and you can hire a wagon and from team farmers near any of the stations along the railroad west of Logansport, and a wagon can go over any part of the prairie. There is good shooting along the railroad for miles on both

sides, but the north side is the best, as you can find plenty of game for twenty miles north. Encamp in a grove near water, and you will be happy. AMATEUR.

PALATINE, Ill., September 12th, 1873.

EDITOR FOREST AND STREAM:—

We have some as nice gunning here in the West as there is anywhere to be found. It is not unfrequently that I take my pointer, Joe, (which, by the way, is one of the noblest dogs that ever I fired a gun over) and go out in the fields, returning in about a couple of hours with from ten to fifteen plump prairie chickens, and occasionally (in the season) as many fine partridges or quail. Our snipe shooting here is of not much account, as we have no swamps, nor any good feeding grounds for them. Of ducks, we get our share of most all kinds, in their proper time. With pigeons we have great sport, especially in the fall of the year, so you see that we are not left quite out in the cold, as far as shooting is concerned. F. J. F.

SALMON IN THE HUDSON.

NEW YORK, September 18th, 1873.

EDITOR OF FOREST AND STREAM:—

I was glad to see in print my communication on the crying evil of "stocking trout waters with black bass," but your compositor made sad work of part of it. As a recent tour in quest of a trout pond or stream which a club might restock, has confirmed me in my views of the importance of the subject, I would like to make my article more intelligible by requesting the reader to replace the word "description," by "discussion," so that the sentence would read "I would like to see a fair discussion," &c.

But to the subject which I now wish to introduce, viz. stocking the Hudson with salmon. Yes! with *Salmo salar*! Why not? What should prevent this noble fish from going up a long way above tide water. There are many streams running into the Hudson which would afford spawning ground. The Croton is one; your memory will doubtless recall many others. A fish ladder could very easily be made at Glenn's Falls; and cheaply too, if one be required, as lumber is plenty there. And so on, over all the impeding dams. I know that the upper waters of the Hudson are splendidly adapted for salmon, to say nothing of many large brooks running into the main river above Lansingburgh.

Now, Mr. Editor, when the United States Fishery Commissioner is introducing salmon into the Delaware, can we not get some salmon fry placed in the Hudson? Try the German salmon as well as other kinds. If the Fishery Commissioners of this State will only show proper zeal, they can do something which will indeed cause people to think them of some use. And I will show them how to do it.

Last year, Mr. C. G. Atkins, of Maine, was employed by several contributors to the fund, to collect salmon spawn on the Penobscot or Kennebec. He was very successful, so much so that the cost of the ova was only a few dollars per thousand. I believe he is to repeat the experiment this autumn, and that the United States Fishery Commission will, as last year, contribute liberally. My suggestion is to have our State Fishery Commissioners subscribe to this project, hatch the ova in the State Hatching House and put the young salmon into the upper waters of the Hudson. The year or two which would elapse before the young fry would be old enough to return, would give our Fishery Commissioners ample time to see that fish-ways were made at every dam for a long way up. Many dams are already prepared for shad, and of course would be used by salmon.

So you see, a few thousand dollars of the State appropriation (now wasted on distributing or catching perch, suckers *ed id omne genus*) would introduce a really important article of food into our beautiful Hudson, to say nothing of furnishing the grandest sport at our very doors.

I don't want to be too sanguine, but now is the time to endeavor to get Mr. Baird to help us. Surely the Hudson is as important a river to stock as can be found. I have descended the stream from its source to Glenn's Falls, and know how feasible the project is. Then there are many rivers, such as the Chateaugay, which flow into the lakes or the St. Lawrence, which used to swarm with salmon. Can they not be restocked?

Now is the time to agitate the question.

Yours, PISCATOR.

"WHAT BECOMES OF THE FISH?"

NEW YORK, September 19th, 1873.

EDITOR FOREST AND STREAM:—

The brief article in your last issue, entitled "What Becomes of the Fish?" gives additional probability to my guide's theory concerning the dead pickerel in Raquette river. During my fortnight's encampment at Hedgehog Rapids, in June, not one was seen. Then the water was high. The pickerel grass and other weeds which they use as a cover, were not grown.

But in August we found nearly four feet less of water. The banks were sedgy, and the shallows everywhere visible. Then the river was full of dead and decaying pickerel, from one to four pounds in weight.

The otherwise pure air of that region was tainted. Hundreds of carcasses were floating lazily with the current, or were lodged among the lily-pads. The cause or occasion of this destruction was a puzzle. The oldest guide on the river, on being questioned, affirms that their slayer is the great blue heron.

Of these huge birds we saw scores daily, wading in the shallow water and grasses. They are known to be most

greedy and unscrupulous fishermen, killing game far beyond their needs for food. Hec. Marden says they watch for the pickerel in their haunts, grip them savagely between the sharp blades of their beaks, and leave them to die. We examined great numbers of these dead fish, and in every case found two large wounds on opposite sides, generally a little back of the dorsal fin, or just behind the gills.

These scars would answer almost exactly to the beak of the great blue heron.

Your correspondent says of the night heron that it is never seen in the day time. The blue heron of the north woods, doubtless a specimen of the same genus, is seldom seen except in the day time.

Both are most destructive of fish. I should vote heartily for the extermination of those Springfield herons, for they destroy trout; but I should like to give a good bonus to the Raquette river herons, for every vagabond, predatory pickerel which they munch in their beneficent jaws.

I like your paper.

J. CLEMENT FRENCH.

MOON SICKNESS.

MUSEUM, WES. UNIVERSITY, }
MIDDLETOWN, CONN., Sept. 11th. }

Every one familiar with sea-faring men must be aware of their belief in the ill effects of the direct rays of the moon. The light of the moon striking the face of a sleeper is held to be particularly injurious.

Many officers do not allow their men to sleep on deck when the moon is bright. I have never talked with a sailor on the subject without hearing cited from personal experience at least one case of temporary blindness or distortion of the face thus caused.

As I could find no reference to this disease in medical works I was at first inclined to class this belief with the superstition which formerly called the insane "lunatic," or "moonstruck," but it is shared by so many intelligent men that it deserves investigation.

Mr. Cuthbert Collingwood in his very entertaining "Rambles of a Naturalist on the China Sea," gives an instance which occurred on a vessel with whose *personnel* he was acquainted, and which was corroborated by all the men and officers.

"The lad was eighteen years of age, of fair complexion, full face and large, light grayish blue eyes which attracted attention from their remarkable appearance. In February, 1864, on a certain night in the full moon, the lad was sleeping on the fore-castle with his face turned upwards, fully exposed to the direct rays of the moon. The circumstance was remarked by his messmates, who warned him but to no purpose. Next night he was one of a deep-sea sounding party and was beating the line when the moon rose, when he suddenly exclaimed that he could not see and would have walked overboard had he not been stopped. For sixteen nights, as soon as the moon arose he complained that a cloud came before his eyes, and it was necessary to lead him about the deck. This was only in moonlight. The surgeon, a gentleman of superior attainments, with whom I am acquainted, examined his eyes minutely and could see nothing abnormal in them. Between decks and during daylight he had no difficulty. When the next moon came around he had recovered from this singular affection which did not return. Many other instances have been related to me by persons, sometimes medical officers, under whose direct notice they fell."

The subject is an interesting one, particularly to sportsmen and others who sometimes sleep in the open air. It is hoped that this may meet the eye of some medical man or naval officer who can throw additional light on the question.

G. BROWN GOODE.

VENOMOUS LIZARDS.

HALIFAX BARRACKS, September 13th, 1873.

EDITOR OF FOREST AND STREAM:—

Having noticed your article on "Woorari" where Dr. Saffray describes a venom as coming from a frog used by the Indians to poison their arrows, I beg leave to state the following facts, which I trust will find some explanation in your columns: Two years ago while hunting in the mountains of Nova Scotia with Indians, during the middle of September, in the dense hard-wood forest, I came across a rather large lizard. I was about securing him, when my Indians cried out "retez!" "retez!" their French for stop. On inquiring the reasons for their caution, they said it was a most dangerous creature, calling it "the man poisoner lizard." They assured me that if there was a scratch on my finger, and I touched the lizard, it would poison me fatally. I cut a stick and poked him. I did this easily, as his movements were rather lethargic. This seemed to enrage him, and he turned on the stick. At the same time a peculiar white creamy and glutinous matter exuded from his body. One of the Indians caught a field mouse. I touched the mouse, who was quite lively, and unhurt, somewhere about the mouth, with the stick which was imbued with the exudation of the lizard, and the mouse died in violent convulsions in a few minutes. I regret very much not having preserved the lizard, which I killed. I do not have much faith in the Indian stories, though my guides were very reliable and trustworthy men, and not in the least inclined to deceive me. I found out afterwards, that the settlers all believed that this lizard was terribly venomous, and cited accidents arising from touching it. The color of the lizard was of a greenish yellow. His body was about four inches long, and his tail about five inches. He had two quite sharp teeth, fangs in fact, on

both his upper and lower jaw, and smaller teeth in front. Have any of your readers come across a similar lizard? Is there any foundation in the universal dread people have of toads and lizards? I think there may be some reasons for it. CAPTAIN P.

CROSSING THE YELLOWSTONE.

Bloody Knife, General Custer's Indian guide, manufactures a boat in this way:—

Two beaves were immediately killed and skinned for Bloody Knife's use. Stout willow wands were then cut and the bark pulled off. They were then bent into the proper shape and bound together by thongs of raw hide. The frame, when completed, looks like a denuded umbrella frame, the tips being secured by a large willow ring which determines the diameter of the circular boat. The hide is stretched over the frame and secured to it by more thongs of raw hide. The green hide is then allowed to dry, the process in our case being hastened by a large fire. When completed, this unique boat looked like a large raw hide umbrella, three feet deep and about five in diameter, without a handle. Yet Bloody Knife declared that this raw hide tub would carry 1,000 pounds. A second bull-boat was made and dried in the same way. The day had been passed in these endeavors, and it was too late to make further trial that night.

We picketed our horses near by, spread our blankets, and dropped to sleep. Just before we retired, an Indian was seen to come down to the bank on the other side to water his horse. As soon as he observed our camp he immediately fled without giving his animal a drink. His surprise showed that our presence so near the enemy had not been discovered. Had we possessed the proper appliances for crossing the river, we could no doubt have effected the passage without discovery. Once discovered, an attempt to cross a line in the morning by our bull-boats would be extremely hazardous.—*Tribune Correspondent.*

AN ARTIST'S AMBITION.

THERE is no reading I like as well as dog reading. Mr. Bulwer's romance dogs is poetry dogs, but not equal to Mr. Dicken's dogs. They is true to the life, and if dogs could speak, for they do think, they would talk just like Mr. Dicken's dogs. Only one thing, sir, and if you don't think it a liberty, I shall presume to remark, which it is in regard to dogs, do what you may, good or bad treatment, they never will perform their tricks and carry a good tail. Now, to make you understand, do you see that yellow spotted dog? That dog knows we are talking about him, and he's pondering on us. Dogs does a deal of pondering. That dog's an inventive dog, sir, and is capable of striking off for himself a perfectly original line of characters, only, sir, when up to the beauties of his part, hingspired I may say, regularly hingspired, he will drop his tail. Some dogs drops their tails more than others; some carries them right between their legs, which takes ever so much away from the traction of the piece. May be, sir, you don't know much about plays where the dog is the actor. The female lady character says: "Oh my dog! my faithful dog! how joyously he bounds this way! We are saved! we are saved! He comes! he comes." Now to see a dog come in like a whiff'd cur takes all the life out of the piece. Dog human nature notwithstanding any of the arts of man, will show itself there. Once I got acquainted with an Italian. He knowed most as much as any man I ever saw on dogs. He had a big spaniel dog, as was a most natural dog. I seed that dog perform a dozen times, and that dog had no drop in his tail, tho' his play was cowed like and not free. Of course his master wouldn't let me handle him. But I paid a friend of mine to have that dog sent me once, just for ten minutes, and I found it out. The dog was nicked, sir; the mussels at the joint of his tail had been clean cut, so that he couldn't drop it or wag it, if he tried.

That ain't true art, and I'm above it. It's the ambition of my life, however, to succeed on that one point. I suppose if I had a very young puppy and trained him up alone, apart from any other dog, and we neither of us lost our tempers, we might succeed. In the meantime, as you see, I satisfy my craving for perfection with short-tailed dogs. Nature and her defects ain't as perceptible in a bob-tailed.

"Will you allow us," we said, "to thank you? for you are really a conscientious artist; it is difficult to meet such."

"Thank you, sir," was the reply. "The living I pick up is one thing, and the satisfaction I derive from my calling another. It ain't often I am appreciated."—*New York Times.*

CROWS IN BERMUDA.—The crows are voted such a nuisance that an Act of the Colonial Parliament has been passed for their extirpation, and 2s. 6d. is paid out of the Colonial Treasury for each crow that may be brought dead to the proper authority. However, the crows build their nests in trees upon islets rarely visited, so that their numbers do not visibly decrease, though some are shot from time to time. During the breeding season the boatswain or long-tail birds (*Phaethon aethereus*) are seen in large numbers flying round the rocks (in the clefts they have deposited their mottled eggs) or roving about the ocean in search of small fish, upon which they feed; and very handsome look these white birds, with their black-tipped wings and two delicate fawn-colored feathers in their tails, as they dart and skim through the air in the neighborhood of their nests.

They are difficult to shoot by reason of their thick feathers, and are easily captured in the holes of the rocks (sitting upon their eggs) by pushing in a stick or rag and jerking them out when they bite the article, taking, by the way, particular care they do not bite your finger with their powerful yellow beak.

Some years ago a gentleman passing through Bermuda was anxious to obtain a few specimens, and was sufficiently unwary to advertise that he would pay 2s. 6d. apiece for any that might be brought him, and he was soon in possession of a boat load, for which he had to pay several pounds, with the consolation of hearing that the public verdict was "served him right!"

Some years ago the Virginian partridge was brought to Bermuda, and the birds are said to be thriving and increasing and to be well suited to the climate, or rather the climate is well suited to them.—*Saint James Magazine.*

For Forest and Stream.
NARRAGANSETT BAY.

VIEWED FROM THE ESTATE OF E. D. PEARCE, ESQ., SEPTEMBER, 1873.

I've wandered far and been in many places,
With heeding mind, fixed thought and open eyes,
And memory paints but few with half the graces
Of the fair scene which now before me lies.

I see the city's spires and silvery dome,
Its trees, the wharves, its bridges all in sight,
The noble river safely bearing home
Its fleet of summer steamers, swift and white.

The breeze brings music from the crowded deck,
With rousing chorus from the happy throng;
While new formed wavelets roll to shore and break
Where Flora's offerings from the sea are strewn.

Oh lovely peaceful stream! not more of praise
Thy beauty, than thy graceful bosom given
To serve thy Maker's will, and make our days
Of pleasure brighter—less of earth than heaven!

A wooded height along the river's side
Slopes gently downward to the water's edge,
And birds are there, and sing and chirp and glide
In graceful flight from drooping branch and sedge.

The puffing engine flies along its way
Past vale and rock, with steady hand to guide;
Cool breezes blow throughout the summer day
And cedars shade me as I walk beside.

My steps are slow—I fain would linger long
And give to memory all the beauty here,
And so recall the birds' melodious song
And feel the river, woods and meadows near.

Think of their quiet when I'm far away,
While noisy business works my soul-life low,
I'll oft look backward on this happy day
And wish me watching these fair waters flow.

R. FARQUHAR.

X Hunting Caribou in Nova Scotia.

COBEQUID MOUNTAINS,
NEAR WESTCHESTER, NOVA SCOTIA,
September 8th, 1873.

EDITOR OF FOREST AND STREAM:—

Thanks to some instructions given by you to me, as to time and locality, while in your city in June last, I have had the satisfaction of killing my first caribou. As I had informed you, when last I had the pleasure of seeing you, I was not unfamiliar with hunting this animal, having killed three caribou in 1871, and two last year in New Brunswick.

My traps I had sent to a friend in Halifax about the middle of August, and I found them in good order on arrival. At Halifax I stayed a day, and bought a Hudson Bay frieze coat, an admirable protection for bad weather. This with two rubber blankets, a bag or so of buck shot, and a special kind of camp hatchet, made for me deftly by a clever Irish blacksmith, completed my list of purchases. Early next morning after an admirable breakfast at the Halifax House, I took the Inter-Colonial railway to Truro, stopping there at the Prince of Wales Hotel, kept by the most jovial of hosts and Scots, Mr. McKenzie. Truro is a charming little village at the head of an arm of the Bay of Fundy, and is much visited, being the best place to see the wonderful tidal action of the water, known as the Bore. Every fine day hundreds of people drawn from all parts of the world assemble on the bridge which spans the Salmon River, awaiting the coming of the huge tidal wave. Sometimes when wind and tide favor, it rises like a wall, ten feet high, and sweeps on up the Sound. I know of no phenomenon which impresses one more vividly with the idea of the grand, rhythmic power of nature, and I fancy if Herbert Spencer had ever seen it, he would have used it as an illustration. I took some pains to measure accurately the absolute rise of the tide. Taking my sea tackle and sinker, and letting it fall until it touched the bottom, at low water, landing the sinker fast in the mud, and marking the length of the line afterwards, where it was just on the top of the water, the difference I found to be be sixty-four feet, eleven inches. Its approach is heralded by a deep, sullen roar.

At Truro I remained all day, having to make arrangements for the hiring of horse and buggy for a week or so, not only to carry me and my traps to Purdy's, some thirty-five miles distant, but to facilitate any movements I might desire to make. Next morning, with a very good horse, and a rough but strong vehicle, furnished me by McKenzie, I started on my way, my road having been quite thoroughly explained to me. The country I passed through was magnificent. Dark, umbrageous spruce woods, sombre in character, were relieved occasionally by the brighter colored maples. Sometimes gloomy gorges, hardly wide enough for the buggy to pass through, were almost sepulchral from the heavy shadows of the mountains.

In one place the road led along a mere shelf of rock, the Londonderry, a noble stream, rushing along below me. It was a rough road, so that it was almost nightfall before I reached Purdy's. There I found myself in admirable quarters. To the kindness of the host, Mr. Purdy, was added the more delicate attentions of the Misses Purdy, three very handsome and highly educated women. As Purdy's was to be my base of operations, I immediately commenced getting together my supplies, and the question of guides was paramount. I had the choice of several excellent men. Following the advice of my host, I chose George Beesewanger, a native of the place, and secured his services, agreeing to pay him \$1 50 a day and to find him.

My second guide I was instructed to find later. At Purdy's I laid in the heavy rations, such as pork, tea, coffee, flour, Indian meal, &c.

There never was such a glorious view as I had from my window when I rose next morning. Far, far below me were interminable forests of spruce, huge billows of green leaves, surging to and fro with the breeze, and away beyond lay placidly the dark blue waters of the Bay of Fundy. I tarried here fully three days—days of delightful laziness, pure days of sensuous enjoyment—pretending, it is true, to perfect my arrangements, just breathing in the fragrance of the glorious woods, perhaps a little indifferent as to caribou. At last Beese (the final "wanger" to his name I shall drop in the future as quite superfluous) said to me at dinner that "he thought matters were now in good trim, and that he felt it was caribou weather, and that it was time to go to Castlereagh."

In Castlereagh dwelt John Gamble, a famous moose and caribou hunter, who tilled a farm there. Taking horse and buggy, well laden down with provisions, we left Purdy's, and reached Castlereagh, a sparsely peopled settlement, at about dusk. Gamble I found at prayers. There was something inexpressibly solemn in the picture I saw there. In the small rough house were assembled the family, and by the flickering fire Gamble was reading to them the prayers, in deep, sonorous language. I hesitated almost to tell my errand. The last amen was pronounced with unction, when I told him the purpose of my coming. "I was for caribou, and would he join me for ten days or so." He quickly assented, and seemed pleased to go. A more wild place than Castlereagh, as to topography, I never saw. It is the ideal of a spot where civilization ends and a wilderness begins. The people who live here, some forty souls all told, are scattered over an area of about fifty miles. They are all Scotch-Irish, were among the early settlers of the island, and are strictly religious and trustworthy. Their honesty may be shown by the fact that a lock on a door is unknown. Their ideas are primitive, and their language Scotch-English, with a dialect of their own. With but few wants, ignorant of the world or its surroundings, many of them, perhaps, have never, save when hunting, gone out of the shadows of their woods. Everything was arranged for an early start. My party had now an addition—George Gamble, a highly intelligent lad of sixteen, with the pseudonym of "Dandy," going with us. Gamble had located a lodge for moose and caribou some six miles from the settlement, which was our objective point. Next morning, before dawn, we started, dividing the buggy-load between us, the horse and vehicle remaining at Castlereagh. My battery consisted of a Remington, a Ballard, and a smooth bore No. 10. My guides told me that it would be a long and tedious tramp, up hill all the way, and so it proved to be. Bass river, quite a brawling stream, waist deep, was forded; no easy task for me, "heavily accoutred" as I was, and, after a scramble up its steep, rocky banks, at last we struck the woodlands. Here we visited what Dandy called Porcupine Den, when Dandy soon ousted a porcupine, which he slew. Here we halted, took a bite, and started again after some ten minutes' rest, and, skirting the woods, a half hour before sundown reached Gamble's lodge, just on the edge of the caribou barren. The lodge was well built; three of the walls were of logs, the other made of piled stones. The floor had been well rammed down, and it was sweet and clean. Near it gurgled a limpid spring. What struck me most about these Nova Scotia woods was the intense, almost painful stillness. Nature must take her kief here, to awaken later, when, in a paroxysm of passion, with icy blasts she lays low the majestic trees. Beese, Gamble, and Dandy in a trice had everything in military order. Of cooking paraphernalia, a kettle and a frying pan made up the catalogue. Of fragile china or stronger delf had we none. In a half hour, with pliant birch bark and threads of withewood, cups, dishes, and plates were improvised, quite as useful and more durable than those made by the potter's wheel. Fresh spruce boughs of aromatic fragrance, so excellent for consumptives, were spread on the floor. Dandy had killed four grouse as we left Castlereagh, and a good supper was assured us. Gamble was desirous of having variety in the menu, and on his assuring me that there was a stream positively not more than forty yards off, I thought I would try for a trout, though I was terribly tired out. With line in hand, cutting a pole as I went, baiting my hook with some white grub picked from a dead tree, in ten minutes I had some dozen trout. They were small ones, scarcely half pound fish, but gamey and pleasant to catch. With Gamble as *chef de cuisine*, I watched the way he cooked them. The fish were cleaned, not scaled; heads and tails and fins were all left on. Each one was dipped into a birch bark dish, filled with meal, inside a piece of fat bacon was inserted, a place was made for it in the hot coals, and in ten minutes the fish was withdrawn, done to a turn. The grouse were stuffed with wild cranberries, hung from the ceiling with a bit of twine, put before the fire, and Dandy was set to basting them. How good a *pottage de Porcupine* is I do not know, but I must confess that maple sugar as a condiment to a porcupine, though original, is not to be despised. A famous pot of tea was then brewed, and we had bread from the settlement. Hardly was tea swallowed, our pipes smoked, and the least nip of rum taken, than I got drowsy, and think I must have tumbled on the spruce bough covered floor just as I was, for in the morning, between the last word I had spoken or heard, and the song Dandy was singing (some quaint old stave) outside the lodge at daybreak, there seemed to have been but the interval of a second. Looking at Beese, who was still sleeping, I noticed he held

his pipe tightly clutched between his teeth. I ran to my trout stream, took a single refreshing dip, and strolled about some little, and arrived just in time for a glorious breakfast.

Our first day was one simply of prospecting and finding out the lay of the land. A caribou barren (we were on the verge of one) may be described as a *plateau*, covered with a thick grey moss two or three inches thick, on which grows the cranberry. Here and there it is dotted over with huge quartz boulders, covered at their bases with that most succulent of mosses, the lichen, on which the caribou principally feeds. A barren is most always intersected by a running stream, and there are occasional clumps of spruce. This tree always looks dark and sombre, and long trails of funeral-like moss hang like weepers from the limbs. On this moss, too, the caribou feeds. The trees are mostly stunted. This is not owing to the winds, for the barrens are generally encircled by the thick woods, which would keep off the blast, but their low growth is an effect of the soil. Dig where you may in the ground, when you have passed through the cushion of moss there is a morass below. To tread on this carpet of moss may be the poetry of motion as far as softness of footfall goes, but until one is accustomed to its yielding nature it makes walking quite fatiguing. There are no brambles on a barren—nothing but the cranberry and whortleberry. The particular barren we were to reconnoitre had an area of some 800 acres, and was completely enclosed.

The caribou being the most sensitive and observant of the deer species, the utmost silence is necessary when hunting them, so when skirting the barren, save by some mute signs interchanged as to direction, hunters never speak. We all kept together for a mile from the camp, when we divided, Gamble going with me in a southeasterly direction, and Beese and Dandy striking northwest. The woods on our route soon opened, and the walking became easy. Gamble pointed out a tree of black spruce, a perfect giant, which he made a sign I should climb. It was not difficult to scale, and when fairly on top, with my race-glass I scanned the barren we were skirting. I had a beautiful view of our barren, and of several barrens beyond, fully ten miles distant. On our barren I saw no sign of an animal, but on a barren I should have judged five miles off with my glass I plainly made out two caribou. Gamble, on my descending and announcing the fact, expressed some doubt, but on ascending himself verified the statement. Sometime about mid-day we found Beese and Dandy, and after lunching we proceeded homewards by a different route. Dandy was the first to find caribou tracks, which he did cleverly in the afternoon. How he saw it I cannot understand, and it was some time before I could see it, but caribou foot it was, and a little further on the spot where one had laid down was pointed out to me by Gamble. It was determined not to follow up their track, but to still keep up the study of the country, so that in case one of the party got astray, which would probably have been myself, we might have a better chance of finding our quarters. That night, around the camp-fire, Beese told me a hunting story about killing and landing moose, which I at first was inclined to doubt, until Gamble asserted its truthfulness. Some seven years before, Beese said that hunting with two Indians in a rather small canoe, on the head waters of the River Philip, they had shot a bull and a cow moose. Moose meat was scarce at the settlement, and it was a question how to get their carcasses home, as the canoe was too small to hold even 100 pounds of additional weight, and the two moose would gross 1,800 pounds. One of the Indians suggested making a boat of the bull moose and using it for transporting the cow. The bull was opened and disembowelled, the head was cut off, the neck sewed up, he was split carefully, ribs of wood were built into him, and he was launched into the stream, and so, loaded with the cow, was safely towed to the settlement, twenty miles distant.

Next morning it rained heavily, and our camp was thoroughly cleaned and guns overhauled. In the afternoon, the rain having changed to a drizzle, Gamble proposed our going to Rock Lake, some three miles distant. After rather a wet walk of an hour we reached the lake, and Gamble built a raft. One peculiarity of the lake was that it was always bubbling, abounding probably with springs. I had taken a light fly rod, and with a coachman hackle and Blue Professor made a cast or two without success. Later I tried a yellow Dun with no better luck, when choosing a Miller and a bug the trout rose rapidly. In a half hour I had secured eighteen fish, of about two pounds each. A flock of black duck on the upper edge of the lake attracted our attention, and I killed five. Of course this shooting was done at some distance from the barren, as a single gun fired in its immediate proximity would have cleaned the ground of the caribou for a week.

Fresh food now becoming scarce, as we had determined not to shoot any more, we smoked our ducks for the future, hanging them in the smoke of the chimney. Next day we started just at daybreak. The sun rose clear, dispelling the mist, and Gamble said it was "a fine hunting morn, and that it would fetch caribou." Dandy was left in camp, and Gamble, Beese, and myself made the party. It was our intention not to return without a caribou. We made directly for the barren, but saw no sign. We now boldly crossed it, plunged into the deep forest beyond, skirted the second barren, and found here moose tracks three weeks old, but no sign of caribou. Here we came across an old Indian camp, which, being in good order, we took possession of, studying its bearings in case we should have to retrace our steps and spend the night there. We kept on through the

second barren, going round a pretty lake, where Gamble set some otter traps. Still no trace of our game. The sun was now but an hour high. As the forests become dark at five o'clock, when it is light on the barrens until eight, we determined to push on through the third barren as far as we could and camp there, so as to be near the fourth barren early next morning. After our supper of bread and pork, without tea, we wrapped ourselves up in our blankets and slept soundly. We were now fully twenty miles from camp, as the bird flies, and fully thirty-five by the route we had taken, Economy Lake being south of us, and we had some two miles yet to make before we could reach the fourth barren. It was dark when Gamble quietly awakened me. We ate our breakfast quickly, and walked fully two hours before dawn cleared the sky. As soon as it was light Gamble climbed a tree. The country he said had changed somewhat, as it had been seven years since he had been at this barren. As he slid down the tree, by the expression of his face and the glitter of his eye I felt sure he had seen caribou. "Five of them in the barren, not more nor a mile off, a feeding, sir." That was all. Now, with the utmost precaution we traced our steps. Just on the south side of the barren we found a distinct trail, which the caribou had made through the woods. Their tracks resembled these made by cattle, only a little more elongated, for the caribou has rather long, low hoofs. The dung was even fresh, and not much larger than that voided by sheep. They had evidently laid down during the night at this very spot, as little bits of hair were visible. We followed the track in Indian file, Gamble leading, I in the middle, and Beese in the rear. The gait was a slow one, and our feet were cautiously placed on the ground, fearful that even a twig should crack. Not a word was spoken. With one hand on his gun, the other behind him, Gamble would signal with his outstretched fingers which way we should go, or whether we should halt. The track was almost 400 yards long, and a small stream had to be crossed. Silently as otters we went through it. Just then the barren opened on us. We rested for a few moments, then got to the last screen of trees, and saw for the first time our caribou. They were hidden by a slight fringe of spruce boughs, and were not more than 600 yards off. About 400 yards distant in the barren there stood a huge boulder, of a greyish white, glistening in the bright morning sun, and throwing off sparkles of light from the quartz crystals in it. Could we reach it? If able to do that there would be the chance of a shot. We all dropped to the ground, and crawled slowly on the moss, worming our way round smaller boulders until we reached it. Looking stealthfully over the top of it, I was now sure that the caribou were just within long rifle shot. We waited fully five minutes (it seemed to me five hours), hoping the caribou would come nearer. When we saw them first the herd—made up of two old bucks, two male yearlings, and a doe—were playing together; now they were feeding. Thinking Gamble the better shot, I had given him my Ballard, reserving the Remington for myself. Every moment I expected the caribou would move further off. Though they could not wind us, every now and then the nearest buck would pause, slowly raise his head, and look around him, as if on his guard. Gamble looked inquiringly at me, as if asking what to do. I made the motion of firing. Indicating the buck I wanted to shoot at, I left Gamble to pick out any one he chose. I carefully took a resting shot on a sharp edge of the boulder. Presently the furthest buck came a trifle quartering towards me, and taking the most careful of shots, with a fine bead, aiming at the brisket, I let him have it. Almost instantly afterwards Gamble fired. My buck fell dead in his tracks. Gamble's caribou gave one single, short leap, and fell dead not ten yards from mine. One long, exulting shout sounded through the barren as we screamed with excitement. The next moment Gamble was down into the barren with gleaming knife in hand, and the throats of two noble caribou were cut. The buck I had killed was the finest of the two, and would have weighed 300 pounds. Gamble's buck was a trifle lighter. The horns on mine were only fair as to size, while Gamble's were the most magnificent ones as to size and spread I had ever seen. My eight hundred miles of travel were amply repaid. "If my grandsire drew a long bow at Hastings," I must plead it as an excuse for entering somewhat into the exact distance we fired at these animals. Pacing it off, I found that my buck was killed at a trifle under 186 yards, and Gamble's at 170. We rested for awhile, and, seated on our animals, ate and drank as only hungry and excited men can.

Now came the question of how to get them to the lodge, some forty miles distant. Gamble's and Beese's woodcraft then came into play. In a half hour, with their axes they had fashioned a sledge of hackmatack, on which the caribou were placed. Long withwood traces were made, and, like horses, we went in double harness. Awful hard work it was. There was a little stream some three miles off which emptied into Economy Lake, and here was where our hauling would end and water transportation begin. Seven mortal hours did it take us before we accomplished those three miles. At sundown we reached the stream. A fire was built, our last bit of pork was devoured, a cup of coffee was made, and we all soon went to sleep, thoroughly used up men. Next morning was again fine and clear, a trifle cold, but every particle of fatigue had left us. There is some peculiarity in this rare mountain air, which makes a breath of it send the blood through the lungs with renewed and freshened vigor. Gamble proposed making a straight line for camp, and finding Dandy, who would walk to Castlereagh, and from thence take the horse and buggy to Economy Lake and meet us. It was no

sooner proposed than off he started, going off with that splendid swinging gait which only one who treads these native wilds can acquire. Beese now built a raft; it was but the matter of an hour. The game was loaded on, and we were just about pushing off into the stream which emptied into the lake, not more than half a mile beyond, when a pleasant morning breeze sprung up. Here I must confess that what nautical knowledge I may have had now came to me as if by inspiration. From a large birch tree we took some sheets of bark. Under my direction Beese sewed them, a mast and a spar were rigged up, a pennon of birch bark was hoisted to the fore, and with a regular latine sail we went spinning down the lake, much to Beese's amusement. At the foot of the lake we found a settler's cabin, and here we moored our raft. From the settler we hired a span of oxen and a cart, and, loading our caribou, leisurely reached Economy. There, sure enough, was Dandy, waiting for us.

I am writing this at Purdy's, in delightful quarters once more. In a week or so I will go for moose, just as soon as Gamble has made his crop. I shall take Gamble with me, of course, and Beese and Dandy, for better hunters or more trustworthy people I never came across. Gamble says we may safely call the moose on the next full moon.

T. F. C. T.

THE PEOPLE'S HUNTING GROUND.

FROM the New York *Times* we copy in full an admirable article with the above caption. In a late number appeared a communication entitled "Stocking Trout Waters with Bass," addressed to us by one of the first sportsmen in the United States, which exactly covers one portion of the ground taken by our distinguished contemporary. We are only too glad that we have on our side such a powerful advocate as the *Times*, and trust it will continue to advocate the better preservation, of not only our forests and streams, but of their inmates.

"We hear nothing as yet from the Commission appointed by the last Legislature to report on the subject of making the Adirondack forest and mountain region a grand public park and hunting-ground forever. The project is one which deeply interests our citizens. It is worthy of the dignity of modern democracy that the people should have its hunting-ground preserved and cared for, as Princes have had theirs. The cost and sacrifice to New York State would be no more than the grand act of the comparatively poor State of California was to its people, in reserving the Yosemite Valley as a public pleasure ground. The public are favorable to the scheme, and are waiting eagerly for the report of the Committee. But whatever these gentlemen intend doing should be done quickly. If some energetic measures are not taken speedily, before the Adirondacks become a public hunting ground, there will be no game left to hunt. The extraordinarily healthful and invigorating atmosphere, as well as the taste for wild life offered so conveniently in this region, are attracting crowds of tourists and sportsmen. Every traveler must have, if possible, venison and trout for his meals, and the inn-keepers strain every nerve to supply the want. Each new fledged or experienced sportsman must kill his two or more deer, or catch his basket of trout. The consequence is that every nook and corner of the woods is scoured for venison, and every pond and streamlet whipped for fish. We have known an inn-keeper have eighteen hounds out at once for any unfortunate deer that might be in the neighborhood. The present law—if we are not mistaken—permits "hounding," but allows no killing of deer before the middle of August, or the first of September. Yet it is well known that an indiscriminate massacre of these beautiful creatures begins early in June. During the present year does were killed in that month, and we know one instance where a doe was shot, with two fawns within her, while neither her flesh nor skin were of the slightest value. Fawns and mothers are murdered without mercy all through the early summer. Parties were in remote ponds and lakes of the Adirondacks even during July of this year, who hounded or killed by "jack-light," fifteen or eighteen deer. We believe, from careful consideration, that something like a thousand deer are killed each year in the Adirondack forests. It will be seen that with such a merciless and inconsiderate slaughter, it will not need a long time before the supply of deer will be exhausted. In fact, we have no doubt that, if this killing be allowed to continue, within three years a red deer will be as scarce in the North Woods of New York, as he is now in those of Connecticut.

The same thing is true of the trout. It is well understood by all anglers that mere rod-fishing in the season will never destroy this delicious fish in any given stream or lake. A remarkable instance has been given of this recently in Scotland. The best fishing-ground in the United Kingdom is considered to be Lock Leven, in Kinross-shire. This lake is only three and a half miles long, by two and a half broad, and open to the world, on the payment of a certain sum per hour, during the months of May, June, July and August. For the rest of the year the lake is closed to fishing, and the spawning-beds are carefully watched. There are in the lake the pike and perch, bitter enemies of the trout, but these are kept down by the use of the net. For fifteen years the catch has been increasing, giving immense sport to the anglers, and a handsome profit to the proprietor. Last year upward of 17,000 trout were taken there by the fly, and during May and June of this year about 9,000, the average weight being the remarkable size of nearly one pound.

The truth is that man's angling is the least destructive agency which diminishes the increase of fish. The fatal agency is whatever destroys the small fry or injures the female fish before spawning. In the Adirondack waters millions of future trout are destroyed by fishing on the spawning-beds, and much havoc is occasioned by "set lines." To add to the destruction, some guide has introduced into Long Lake and the Raquette waters that "fresh-water shark," the pickerel, or, perhaps, the muscalonge, and in Raquette Lake, the Fish Commissioner himself is said to have put the black bass, which will make terrific havoc with the best fish of American waters. Even at the present time, the sporting parties find it extremely difficult to take any trout, and if this goes on, it will need only two or three years to make "speckled trout" a tradition in the Adirondack lakes. When one thinks of the vast amount of pleas-

ure and health obtained from innocent sport, such a result would be really a public calamity. This and the corresponding destruction of the deer can only be prevented by some vigorous public action. We have law enough, but the difficulty is in its execution. If the "Sportsman's Club"—which has already done "yeoman service" in preserving game—would present a form of an act through their well-known counsel, Mr. Whitehead, to the next Legislature, creating an office of "State Game-keeper," similar to one already existing in Canada, and then have him or his assistant placed in the Adirondack region, the game might yet be saved. If there was a question about creating a new salaried office, the club would have no difficulty in making up the few hundred dollars necessary, and plenty of bold, experienced men could be found in the woods to take its undesirable risks. It is true that the towns have the right now to appoint "game constables," but they cannot pay enough to make any one ready to incur the odium and risk of the office. Moreover, a State official would have far more authority. Let us save the game in time.

Athletic Pastimes.

—The St. George's Club of New York and the Marion Club of Philadelphia, will play a match at cricket on the grounds of the former at Hoboken, tomorrow and Saturday. The St. George's eleven will consist of Cashman, Jones, Moeran, Sleigh, Smith, Bowman, Lennon, Harcombe, Sonter, Talbot, and Ewing. Wickets will be pitched on Friday at 2 o'clock, and on Saturday at 10 o'clock. The Marion Club have a strong eleven, and an interesting match is expected.

—The Prospect Park Club have resumed their practice, having ceased to play for thirty days in consequence of the death of their late Vice President, George T. Keiller.

—The Germantown Club of Philadelphia, have challenged the St. George's Club of this city to play a match at Hoboken on October 3d. and 4th.

—The following professional players have made engagements with clubs for 1874:—Hicks, Malone, McVey, Clapp, Allison, Cummings, Zettlein, Spaulding, McBride, Matthews, Mack, Barnes, Fisher, Carey, Ferguson, Meyerle, Sutton, Fulmer, Force, Burdock, Radcliffe, George Wright, Henry Wright, Cuthbert, Leonard, Remsen, York, Pike, White, Fisher, Gedney, McMullin, Hines, Eggler, McGeary, and Glenn.

—The return match between the Excelsior Quoit Club of Dartmouth and the Komos Club of Halifax, Nova Scotia, was played on September 17th, on the grounds of the latter club, and resulted in favor of the Komos who won handsomely in both innings. Many of the best players of both clubs were conspicuous by their absence. The substitutes played remarkably well. The rest of the day was spent in lunching, toasting and speech making.

—The annual fall game of the New York Athletic Club, will be held October the 4th, on their grounds foot of I33d. St. Harlem.

—The Atlantics were defeated by the Baltimores in Baltimore on Friday, the 19th, by a score of 14 to 5.

—On Saturday, the 20th, the Athletics beat the Atlantics at Philadelphia, by a score of 11 to 5. The batting and fielding of Anson was the most noticeable feature of the Athletics' general good play, Burdock bearing off the palm for the Atlantics in fielding. The game was impartially umpired by Fulmer.

—The eighth game of the champion series between the Bostons and Mutuals, took place at Boston, September 20th. The play was anything but good on the part of the Mutuals who only scored in three innings, they being virtually beaten on the sixth inning. Nelson played second base finely and Eggler excelled in the field. The score, Bostons 7. Mutual 1.

—At a meeting held in Baltimore last week \$4,900 was subscribed towards securing a nine for that city for the season of 1874.

SAGACITY OF BIRDS.—A great mental quality which birds seem to have in excess of other animals is a very fine calculation of distance, and this, too, in direct subordination to their own well-being. It has been shown again and again—and Mr. Leith Adams refers to some facts in support of it in this essay—that as new weapons of offence are invented many species of birds narrowly observe the range of the new bows or guns, and keep out of range, not even troubling themselves to go at all farther than is necessary to be out of range. Quite recently we have read, though we cannot verify the reference at present, of some birds that adapted themselves, within a few days, to the increased range of the rifle, directly after they had learned its range for the first time, having been previously accustomed only to the fowling piece, and kept just outside the 2,000 yards' range, or whatever range it was, retaining their composure at that distance. We suppose the wonderful accuracy of the traveling birds in striking the exact point for which they are bound, of which Mr. Leith Adams gives us wonderful illustrations, is a still greater proof of the same power. Mr. Adams tells us of swifts which after eight month's absence in the South, at a distance of some 1,800 or 1,900 miles, return not merely to the same region, but to the same nests, which they had deserted, and that, too, year after year, the individuals having been marked so that there could be no mistake as to their identity, unless indeed there is such creatures as "claimants" to abandoned nests even in the ornithological world. Again, the delicate adaptation of the power of geometrical measurement to the welfare of its species, seems to be shown by the weaver-bird of India, which hangs its "elaborately-constructed, purse-shaped nest" from the tops of branches overhanging deep wells, in order to render it particularly difficult for enemies to get at the nest without running a great risk of falling into the well.—*The Spectator*.

Brute speech—Deer-stalking.

Woodland, Lawn and Garden.

HEDGES AND THEIR USES.

No. VI.—THE AMERICAN HOLLY, (*Ilex*).

"Shoots up its spine, and shakes its leaves in the sun."—*Proctor*.

"Happy is he who, in a country life,
Shuns more perplexing toil and jarring strife;
Who lives upon the natal soil he loves,
And sits beneath his old ancestral groves."

We speak in this paper of a plant, a venerable relic of the old plantation of the Elizabethan age, yet a plant long neglected for no good reason that we can perceive. In the days of Henry and Queen Elizabeth, there abounded what were termed ancient parterres, or picturesque gardens. In these rich old grounds this green Holly did much abound. While we like the plant, we like not its "topiary" treatment, at that time common. It is a whimsical, barbarous conceit, this cutting out of the green Holly the "Great Queen Dragon" or any other horrid ingenuity suggested by the morbid fancy of the gardeners (?). Were we to call such men gardeners at this period, we should offend against all sense, reason or good taste. But we can pardon even this low taste, this meagre appreciation of high art, so long as it has left us unimpaired in its native beauty, the grand old American Holly. From the man of unappreciative mind and uneducated taste we can forgive much, for in what is left the true lover of nature rejoices.

"A wood coeval with himself he sees,
And loves his own cotemporary trees."

Among the beautiful plants that may be called suitable for hedges, we would name the American Holly. If we could only press into our service as a hedge plant the old English Holly, well adapted to withstand the cold of our severe winters, what a beautiful tree would grace our garden plots. Who does not love its rich, deep green leaves, its grassy foliage, and its rich garniture of bright coral berries, studding like gems its massive beauty? Only a few of these beautiful evergreens grace our American gardens, and these secured an existence only by the most skilful care; while in England it may be truly called the "pride and beauty" of the English garden.

Passing the many bright and delightful recollections of the Holly tree, and its legends and Christmas carols, its talismanic virtues, and its many bright associations, we feel that if we cannot have the English Holly from the uncongeniality of our climate, we need not despair.* While we are compelled to part reluctantly with the European Holly in our Middle States, yet it may be cultivated some. what, as it has been, south of Philadelphia with tolerably good success, and in time we may hope to see it fully acclimated. We would encourage lovers of this valuable plant to make experiment, hoping that some fortunate individual may in time succeed in growing a hedge of the Holly.

We fall back with a good grace and much confidence to the American Holly, which in several respects nearly resembles the European. Our American Holly has leaves very much like the English, waved and irregular upon its surface, and in general outline, though the leaves are somewhat longer than the English. They are in color a trifle lighter green than their European prototype, and like it present the same row of sharp points or prickly terminations. The berries, perhaps, do not grow quite so profusely as upon the English, but in quantity sufficient for all purposes of propagation. The American Holly may be said to cover quite an extensive region of our middle climate, and one has only to take a journey to the eastern shore of Maryland, some portions of Virginia, and the lowlands of New Jersey, to find this plant growing not only profusely but in full perfection of all its natural beauty. I had the pleasure once in company with Mr. A. J. Downing, of visiting in Maryland a most splendid grove of American Holly. It would have done one's heart good to have looked upon some of those beautiful green trees. "It is no uncommon sight," remarked Mr. Downing, "to behold trees forty feet in height in such localities." In the shady swamps where the soil is cool and rich, it grows perfectly rampant.

In conversation with a gentleman of much intelligence, from West Tennessee, he remarked it was his belief that the experiment of transplanting these Holly plants of one and two feet high, might be done with perfect success, were it done at the right season and in the right manner. My own observation led me to that conclusion. Here were isolated plants, perfect in symmetry and in healthy condition, so wondrously beautiful that I longed for a spade and means of transportation for some of them. There is but little question in my mind that the same degree of care that is requisite to grow a good hemlock hedge would also give with cultivation an equally as good Holly hedge, and oh, how much more beautiful. In such localities as the one I am speaking of, the Holly tree often reaches forty feet in height and from twelve to fifteen inches in diameter.

The Holly is quite a slow growing tree, yet is nevertheless always beautiful. The American Holly can be quite easily cultivated, and we are surprised that so few specimens of it, even as trees or separate plants, to say nothing of it as a hedge plant, are cultivated in our gardens and upon our lawns, where they never fail to prove very attractive. The seeds of the American Holly can be very easily procured, and can be as easily propagated as many other not half as beautiful and valuable plants. To have the

*Many attempts have been made to acclimate the English Holly in the New England States, but without success. Much money has been spent for this purpose in vain. True, we have, and still may see in highly sheltered enclosures fine specimens of the Holly; but they are quite rare, as the plant is too tender for New England.

seeds of the Holly tree vegetate readily, you have only to gather in autumn the quantity you wish to plant; then you should scald or immerse them in boiling water, and let them remain in water until it becomes cold; sow immediately, having previously prepared your plot of ground. They then vegetate in the coming spring, as freely and as easily as the well known asparagus seed.

Let us urge upon our agricultural friends and all lovers of fine hedges to give this beautiful and, we fully believe, reliable hedge plant a trial. If you do not feel like making a large investment in plants, try the seeds. You can easily procure them, and plant some quarts or pints of them, watch their growth carefully, and note your experience with them, and you will not only confer much pleasure upon yourself, but your efforts to introduce this valuable plant to a more extended notice, will be a public benefit.

Our appeal is for the Holly; plant its seeds; transplant its small trees, and introduce again some of the rare plants used in ancient gardening. Evelyn says, in the year 1664: "Above all natural greens which enrich our home-born stone, there is none certainly to be compared to the Holly. Is there under heaven a more glorious and refreshing object of the kind than an impregnable hedge of one hundred and sixty-five feet in length, seven high and five in diameter, which I can show in my poor gardens at any time of the year, glittering with its armed and varnished leaves?" Thus says Evelyn, a most practical lover of nature, in the early history of the Holly.

Now why cannot our American agriculturists take a hint from the old man eloquent? He loved nature, and revelled in the genial and the bright as revealed in the lilly, the rose, and the Holly; all were but types to him of a great and beneficent Father, teaching through his works the wonderful creations of his mighty power.

The Holly seed, as I have before stated, should be gathered in the fall months of the year, and treated as I have named, and planted at once. If the ground is well prepared, they will come up quite readily in the spring, being quite hardy of themselves.

Now readers of the FOREST AND STREAM, and especially those who are interested in the ornamental as well as practical—those who love the noble and elevating science of ornamental gardening, how many of you will respond to my appeal for the Holly? Commence this present fall; gather and prepare the seed carefully, and deposit them in the seed bed, looking to a green and bright germination in the glorious spring time.

OLIPOD QUILL.

CENTURY PLANT.—The Century Plant on the premises of Mr. Lee, now stands thirty-six feet high, and has about forty bunches which contain upwards of a thousand buds. The young plant on the same place is three feet high and has ten large buds which are as far advanced as those on the large plant. Upwards of two thousand persons have registered as visitors to these plants.

The denizens of San Jose are paying twenty-five cents apiece to see a Century Plant in bloom. There is scarcely a month in the year but one of these plants can be seen in full bloom in Los Angeles.

This remarkable plant, is generally understood as blooming only once in a hundred years. As a general thing here in California it blooms at from ten to fifteen years after planting, and if more attention was given to it, would bloom in from six to ten years.

This Plant (*The Agave Americana* or American Aloe) is one of the most desirable plants that can be found to place in large open lawns or parks as a show plant. It is a clean and showy plant always during its growth, it is also a fine hedge plant, and will prevent horses or cattle from breaking in or out—it should be grown more extensively.—*San Jose, (Cal.) Express*.

MAN, THE DESTROYER.—When nature out of her supplies has bountifully provided for all dependent upon her, man as often as not steps in to play havoc with what is left. We know that the greed of man, allied to the food-wants of our great and accessible seats of population, and, as in the case of sea-fish, the comparatively easy acquisition of a money-yielding commodity that costs nothing, has undoubtedly made an impression on various species of animated nature. Grouse-moors, for example, are becoming in some districts exhausted from over-shooting; and many kinds of inshore fish, notably the haddock, are yearly becoming scarcer, because of the incessant industry of our fishermen, impelled to constant work by the pressing demand of the public. Oysters are not nearly so plentiful as they were wont to be, and no wonder, considering the enormous numbers that are brought to market. London alone requires one billion of these delightful bivalves every year, whilst Manchester, Liverpool, and other large towns could consume a much larger number than they can obtain. Even in France, where economy is a study, some kinds of animals are exhausted, nature having been overborne. The oyster-beds of France, for example, have nearly all in turn been dredged to death, so that it became necessary for man to plant them anew; and in particular instances this has been done with success. A French oyster-ground which was barren in the year 1856, produced 320,000 francs in five years' time. In Ireland the greed of man has despoiled many of the natural beds of oysters. Other kinds of shell-fish are yearly becoming more difficult to obtain; fishermen now experience a great scarcity of bait, and require to proceed long distances to obtain supplies of mussels. Our inshore lobsters are annually becoming smaller, whilst men have to proceed to greater distances to capture them. We know, too, that the capercaillie had at one time almost entirely disappeared from Scotland. The wild white ox has vanished, and Shetland ponies are less plentiful. So are whales; men go farther and find fewer of them now than they did fifty years ago. Seals, too, will in time become scarce, so fierce has become the pursuit of man in search of them.—*Chambers' Journal*.

The Magazines.

AN OLD BILL OF FARE.

IN her capacity of cook, Mrs. Woolly, (the Miss Leslie of the time of Charles the First), catered for well-to-do people. She gives us bills of fare "without feasting, only such a number of dishes as are used in great and noble houses in their own family, and familiar friends with them." A couple of examples will suffice to shew what sort of dinners grand folks sat down to in the days of the Merry Monarch. In summer-time the first course might be: A boiled or baked pudding; boiled chickens; stewed carp; a Florentine; a calf's head, one half roasted, the other half boiled; haunch of venison; venison pasty; a couple of fat capons, or a pig. The second course: partridges; artichoke pie; quails; cold pigeon pie; souced pig; salmon; tarts; a Westphalia ham, and dried tongues about it. In winter, the first course might consist of: collar of brawn; a capon and white broth, two roasted neats' tongues, and an udder between them; a chine of beef roasted; a shoulder of mutton stuffed with oysters; a salad of divers herbs and pickles; eel pie; three young turkeys in a dish; souced fish. The above to be followed by a quarter of lamb roasted; a couple of rabbits; a kickshaw fried; mallard; cold venison pasty; a dish of snipes; warden pie; tarts; sturgeon; pickled oysters—cheese of all sorts, jellies, and sweetmeats coming upon the table as soon as the meats are cleared away. The total absence of soup, the lack of vegetables, and the substantial nature of the provender altogether, perhaps justifies the outbreak: "Who are so weak as our English people! for they eat so much of meat, that they distemper themselves with it; whereas if they did eat herbs, roots, and plants more freely, it would be better for them. Observe the diet of other nations, they make savory meat, and do not use half so much meat as we do!" We certainly are an obstinate race in matters of eating and drinking; and we fear all the lecturing in the world will not lessen the consumption of meat in England by a single beefsteak.—*Chambers' Journal*.

THE FLIGHT OF BIRDS.

Mr. Hubert Airy, in the last number of *Nature*, differs somewhat respecting the flight of the eagle, as described by Mr. Herschel, an article in regard to which was copied in our columns. Mr. Airy says:

"If there was no quiver of the wings perceptible 'at an apparent distance of ten or twelve feet'—if the very tips of the wings 'looked as steady as those of a stuffed specimen,' then certainly the theory of self-support by muscular action must be abandoned, and the problem is reduced to one in which we have only to consider the weight and shape of the bird with outspread wings, and the velocity and direction of the wind.

Captain Herschel rejects (perhaps too hastily) the notion of 'slants of wind,' and asks: 'What becomes of the horizontal force' of the wind? Surely its effect would be to balance the horizontally resolved portion of the bird's slant fall, just as the vertically resolved portion of the slant current of wind would balance the vertically resolved portion of the slant fall.

Different degrees of inclination and force of the wind might be met (within limits) by different degrees of slope and spread of the wings.

I must confess this is only theory. We want more observations, as keen and careful as Captain Herschel's, to ascertain the force and direction of the wind attending this arrest of motion in mid-air. Slant currents are common enough on a small scale among house-walls, and on a larger scale we may see how the wind pounces down on a land-locked water, or presses up a mountain side. In a steady wind, the shapes of hill and valley must cause certain regular currents variously inclined to the horizontal, and some of these, I suppose, the eagles find and use. On the lee side of a hill (as in the case given by Captain Herschel) there would be a current rising from the eddy to join the main course of the wind."

THE BALANCE OF NATURE.—When man, from his desire to obtain sport or food, destroys some particular species of bird, beast, or fish, nature speedily places the matter before him in such a way as to indicate the error of which he has been guilty. Of this we have a striking and painful instance in the case of France, where the foolish and cruel practice of killing all sorts of birds has given latitude to whole hosts of insects which prey on the crops. So too, frequently, the gamekeeper remorselessly shoots down the birds of prey that would kill the rats and other vermin which, whenever they obtain the chance, devour the grouse or eat their eggs. What is the result? It is simply that more grouse are destroyed in one way than in the other! The more hawks that are shot the worse it becomes for the grouse. The hawk, like the sparrow, has its mission, and on a grouse-moor that mission would appear to be the weeding out of unhealthy birds which, if allowed to live, might perpetuate unhealthy progeny or breed disease, and so ruin the moor. The stock is kept at its best by the weeding out constantly performed by predatory birds; a scheme of nature to maintain a healthy and vigorous breed. The economy of a grouse-moor is not, we think, sufficiently understood. It would be well if a reliable estimate of its wild population could be formed, so that it could be ascertained, with more exactitude than is at present the case, what percentage of birds man might shoot, and how many grouse per acre ought to be left, in order to multiply and replenish the stock. It has been affirmed, that to the mania for over-preserving game, we owe the grouse-plagues which have more than once prevailed during these later years; and, at a meeting of the British Association, it was asserted that, if the kites, falcons and hawks, once plentiful in Scotland, had not during the past twenty years been so ruthlessly killed off, the grouse disease would have been stamped out before becoming epidemic, it being the business of those keen-eyed foragers of the wilderness to snap up all the weak and sickly birds they can find. A given number of acres of heather will only breed and feed a given number of birds, and if more grouse is hatched than there is food for, it follows, as the merest matter of course, that the birds will be weak and ill-fed. Nature, in short, has established a balance, which it would be presumptuous for man to imagine he could improve by disturbing.—*Chambers' Journal*.

Advice to anglers—"Spare the rod."

HOW LEATHER IS MADE, AND COBBLING DONE IN BLIDAH, ALGERIA.—The manner which shoe-leather is prepared in this part of the world is curious. When a skin has been removed from a cow, for instance, the Arab proceeds first of all to cut off the head, together with the horns and the hoofs, and then, hanging it up, he scrapes off all the fat that may have been left clinging to the inside. When this is done it is well rubbed with salt, and placed out in the middle of the road with the inside exposed. Passers by trampling it under foot all day; then, when it is perfectly dry, it is taken up and cut in rectangular pieces about a foot long by five inches broad, which are sown on the shoes—as soles—with the hair outside. Arab shoes when new cost from two to four shillings a pair, for which the very best may be obtained, and the charge for resoling them generally varies from a shilling to fifteenpence. A considerable trade is done in second-hand shoes among Arabs in needy circumstances. Wherever, for example, a Bedouin buys a new pair he is sure to make an arrangement to be allowed a certain sum for the old ones. These the cobbler mends, and eventually sells to some less fortunate countryman, who, having none at all, and perhaps very little money to purchase any with, is glad to procure a pair cheap. Thus the market cobblers have always a stock of second-hand shoes with them, which they generally manage to get rid of during the course of the morning besides sewing on ten or a dozen pairs of soles.—*Gentleman's Magazine*.

THOREAU.—It was his habit to go abroad every day to the fields or woods, or to the river. "I go out to see what I have caught in my traps, which I have set for facts." He loved the world, and could not pass a berry without a question. Men who had seen the partridge drum, caught the largest pickerel, and eaten the most swamp apples were the men for him. The farmer who could find him a hawk's egg, or give him a fisher's foot, he would wear in his heart of hearts. He admired the toil-worn workers, seasoned like granite and pine, slow and silent as the years, "like the sweetness of a nut, like the toughness of hickory." "The farmer spoke to me, clear, cold, moderate as the snow when he treads. Yet what a faint impression that encounter may make on me after all. I see men like frogs; their peeping I partially understand."—*Channing*.

Natural History.

THE NOTORNIS A RARA AVIS.

THE last number of *Nature* has some very interesting facts in regard to this exceedingly rare bird, the Notornis, which though discovered and described in the last century, naturalists have for a long time been doubting. Mr. Newton, in *Nature* states that "no specimens are known to have been brought to England for upwards of eighty years, and that only two are believed to exist in museums, one in Liverpool and the other in Vienna." He adds:

This bird, which has been variously assigned to the genera *Gallinula* (moor-hen), *Fulica* (coot), and *Porphyrio*, is now referred to the genus *Notornis*, containing only one other species, the "Takahe," of New Zealand (*N. mantelli*), itself nearly, or quite, extirpated. It was about the size of a barn-door fowl, with the bill and legs red. The Viennese specimen seems to be entirely white; the example at Liverpool is mottled with purple, but not enough to gainsay the name of "White Bird," by which it seems to have been known both in Norfolk and Lord Howe's Islands. It would no doubt, if taken alive, be easily kept in confinement, and I need not say how highly a living example would be valued by the Zoological Society; but this is perhaps more than can be reasonably hoped for, and so far as I am concerned, I should be well content with a specimen in spirit or a skin with all the bones accompanying it, for the Cambridge Museum.

The species is most likely extinct in Norfolk Island, but a passage in a pamphlet by Mr. Edward Hill, published at Sydney, in 1870, seems to show that it may still exist in that of Lord Howe—though, if so, doubtless on the verge of extermination through the pigs with which the island is said to be overrun; for the bird is believed to be unable to fly. Should any examples be still living, it would certainly be better that their remains should be placed in our museums, than that they should contribute to the formation of pork; and I write these lines that they may attract the attention of some Australian readers of *Nature*, who may be disposed to do a good turn to the University of Cambridge.

MIGRATION OF FROGS.—The Logansport (Ind.) *Star* relates and vouches for the truth of the following recent occurrence in Cass County, that State: "For some days past the weather had been dry, and the ponds on the prairie failed in water. The turtles and frogs that had been living in the vicinity of one of these stood it for a day or two, but it finally became too dry for frogs and they decided to migrate. The nearest pond that contained water was three miles distant, and to this turtles and frogs started in solemn procession, the turtles in advance sagaciously piloting the way, and the frogs bringing up the rear. The procession stretched out over the prairie a quarter of a mile long, and steadily marched to the goal."

ANIMALS AND INSECTS SUFFERING THE PENALTY OF THE LAW.—In the year 1120 the Bishop of Loan thundered against a plague of caterpillars a sentence of excommunication. In 1576 a swarm of caterpillars was formally tried before the Court of Troyes, an advocate being appointed, for the defence, and being found guilty, were summoned to withdraw in six days on pain of being declared accursed and excommunicated. Several instances occur in France of pigs being hanged and their bodies reduced to ashes, for devouring little children, or for attacking grown persons; but in all cases, they received a fair trial.—*Saint James Magazine*.

—THE TOAD ON GRAND MANAN.—Visiting the island of Grand Manan, New Brunswick in the summer of 1872, I observed the common toad (*Bufo americanus*) in large numbers. I was informed by Mr. Walter McLaghlan, keeper of the Gannet Rock Light that none were to be found until 1854, when he introduced a pair from Maine. From these parents the whole of the island has been stocked in eighteen years. Mr. McLaghlan proposes to introduce turtles in the same way. G. BROWN GOODE.

THE HERRING AND ITS FOES.—One of the most prolific fish of the seas, according to its size, is the common herring, which, as a general rule, is only a few ounces in weight, and yet yields many thousand eggs—far surpassing in that respect the salmon. But the herring requires to be enormously prolific in the reproduction of its kind, because the waste of herring-life is enormous. Man annually robs the shoals to a vast extent, and although man's depredations are enormous, they are reputed to be trifling compared with those of many other agencies which are daily at work. Man only takes his tens of thousands, but the codfish, we are told, takes hundreds of thousands, and the gulls and gannets of the neighboring rocks are constantly engaged in exacting daily tribute from the herring shoals. We have examined the internal economy of a codfish, which contained in its stomach no less than eleven full grown herrings! If a few hundred thousands of cod fish go day by day devouring herrings at this rate, their devastation in the course of years must swell to a vast figure. Then the cod is only one of the sea-enemies of the herring: there are also dogfish, which follow the shoals in immense numbers, eating the herrings out of the nets in which they have been enmeshed. It has been calculated that the cod and ling fish taken in one year in the seas and friths around Scotland would devour more herrings than could be caught by fifty thousand fishermen. Solan geese live upon herrings during those seasons in which they can be obtained. A calculation of the herring-eating powers of these birds has been made, which is as follows: Say that the island of St. Kilda has a population of 200,000 of these birds, and they feed there for seven months; let us also suppose that each bird, or its young ones, eats only five herrings *per diem*—that gives a sum total of one million of these fish; and counting the days in the seven months from March to September as 214, that figure may be taken to represent in millions the quantity of herrings annually devoured by these birds.—*Chambers Journal*.

The Kennel.

THE deer-hound is a noble specimen of his race, his proportions being quite as good as those of the greyhound, in which he resembles the rough variety of that beautiful dog. He is possessed of better powers of scent than the greyhound, and in chasing game depends as much on his nose as on his eyes. It is curious that, although he makes use of his nose when running, he holds his head higher from the ground than the greyhound, which only uses his eyes. The purity of the breed is judged a good deal by the coat, which should be very wiry, long, without being woolly. The old deer-hound is becoming scarcer every year, and a cross of the fox-hound with the deer-hound makes the most useful dog to hunt the stag. The object is to obtain a fine nose, so as to hunt a cold scent, but united with such speed that he may be able to keep the deer in sight.

We have many letters from gentlemen who have pointers, setters, and fox-hounds, asking us to write on their management and keep; also what kind of kennel is the best, and what food. One of the very best authorities is "Stonehenge," but in some instances we differ from him, such as in giving large quantities of oat meal, &c. The kennels intended for pointers and setters should be dry and well protected from the weather; but they should be kept cool, on account of the exposure to wet and cold which shooting dogs incur. Many persons keep their dogs chained up to a small yard kennel, but the plan is not a good one. In your yard, have a space set apart sufficiently large to allow the dogs room to move round easily; pave it with hard bricks, keep it washed; but it should not be roofed in, as the rain serves to harden these dogs, who will not suffer from it, if their beds are dry. An inner room must also be provided, but don't make any bed during the summer. In order to keep the yard as sweet as possible, it should have a fall from the centre, where there should be a trapped grating to carry off the washings of the yard. When dogs are kept long in kennel they are almost sure to contract some eruptions of the skin, which is often caused by parasites of one kind or another, such as fleas, ticks, and lice, which are great pests and difficult to eradicate. The proper method is to dress the dogs once or twice in a season, with a mixture of train oil and brimstone, which may be rubbed into the roots of the hair over the whole body, or take white precipitate in powder, rub it well into the roots of the hair, let it remain for two or three hours, taking care the dog is carefully muzzled, then brush all out and keep the dog dry for some days.

Now, as to the food: Indian meal mixed with a little oat meal and table refuse, all boiled together, will make excellent food for shooting dogs, in an ordinary way. Bones are eminently essential to health, for unless the dog has something to gnaw, he does not produce the amount of saliva which is required for his digestion. Green vegetables, such as cabbage, potatoes, carrots and turnips should be given twice a week during the summer months, and by pouring a little soup broth over it they will be glad to eat it. Throughout the months that dogs are idle, they require no flesh, and their mess need only be flavored with broth. When dogs are hard at work, there is nothing better than sound horse-flesh, boiled; but this should be given gradually, and it is well to give them an occasional meal of it during the summer, to avoid the chance of its disagreeing in the fall, which it often does, when given for the first time.

Dogs are too often sadly neglected. They are sometimes left in a kennel for weeks, and even months at a time. When this is allowed, they become fat, inside and out, and are not able to work. The shooter is well aware of this fact, as exhibited in his own person, and yet he will often ignore it as concerns the inmates of his kennel. He should remember that the setter travels over six times the ground which he does, and at a fast rate instead of a walk. Some

dogs have naturally thin soles, but even these may be made thicker by use. Let every shooter see that these precautions are used, and he will not suffer from the disappointments which are so frequent, owing to their neglect. Many a mistake is caused by want of condition, and not from want of a good nose, for a blown and exhausted animal is not in possession of the sense of smell.

ST. LOUIS, September 15th, 1873.

EDITOR OF FOREST AND STREAM:—

In your paper of the fourth instant in "Answers to Correspondents" I note remedy for worms in dogs.

Let me suggest worm seed. One teaspoonful to be given a full grown dog at evening, to be followed the succeeding day by castor oil, one ounce. Repeat after three days. For a pup less than one year old, half that quantity of seed and a proportionate quantity of oil. Two doses will probably cure; certainly will not kill.

With your permission I will tell your friends how to cure mange: whale oil soap, four ounces, which dissolve in clean water, four quarts; but not in a brass or copper vessel. Wash the dog thoroughly; probably three washings will cure, if not, repeat the washings. It rarely fails, but should it, take oil of tar, two pints, sperm oil, one pint, mix thoroughly; anoint the dog with the mixture; two applications ought to cure any ordinary case, but may not if of long standing; if not, then wash thoroughly with suds from castile soap and repeat the anointings. It will cure, but it is harsh; whale oil soap suds is preferable.

Almost this same receipt for mange we find in the last number of *Land and Water*, only linseed oil is substituted for sperm oil. J. J. asks if we know of any way to rid dogs of fleas, and keep the brutes clean of these pests. In our number five we recommended insect powder. See "Answers to Correspondents."

We add what we believe to be a most useful receipt, if not for curing, at least for alleviating distemper. We know it was tried by a friend of ours last year with success. We copy the article in full from *Land and Water*. "I formerly used to lose two-thirds of the pups I bred, although using all the remedies given in different sporting works, but for the last ten or twelve years I have never had a single case of distemper in my kennel. My plan is simply this: Soon as I take the pup from the bitch, I give twice a week doses of garlic, and continue this treatment till the dog is a year old. After that I consider him safe, as the disease generally attacks dogs between six and nine months old. While the pup is very young, a piece of garlic the size of a pea will be enough for a dose, and as it grows older it may be increased to the size of a bean or hazle nut. If at any time it should purge too much the dose should be diminished. In cases where distemper has attacked a dog, I would give garlic three times a week, and keep him warm and dry. In nine cases out of ten this will effect a cure, and has been used with great success."

Answers To Correspondents.

DR. A., Brooklyn.—For mange in setter bitch; take of compound sulphur ointment, four ounces; spirit of turpentine, two ounces; mix and rub well into the skin twice a week; or take of iodide of mercury, one drachm; lard, one ounce; mix and rub a very little into the roots of the hair every day.

J. W. B., Brooklyn.—Red mange is a constitutional malady, and can seldom be cured without internal medicines. Arsenic in minute doses, continued for some time, is a great specific against the foul condition of the blood, but never give it on an empty stomach, but mixed with the food. Solution of arsenic, five to eight drops; add to the food, and give twice a day, the dog being fed night and morning. If in a month the whites of the eyes do not become red, increase the dose gradually until they do, then diminish a drop per week till the redness disappears, when continue the dose till the eruption is gone.

G. C. E., JACKSON, Miss.—Have shown your letter to C. B. He says "he would be willing to leave the question to a committee of sportsmen whether a nine or ten bores may be termed swamp angels." All he did: as to killing birds was perfectly legitimate. The gentleman in question we know to be a thorough sportsman, who has done as much for the preservation of game, and making of game laws as any one in the country.

S. H.—Keep your dog well fed, and he will seldom attack sheep.

REGULUS.—There is no acting Fish Commissioner of the State of Virginia at present. One was appointed last year, but the funds appropriated for this Commission are now exhausted, owing to the deplorable condition of the public finances.

A. M., Madison Avenue.—If you will give us explicit details, being above all sure of your facts, we will put the matter before Mr. Bergh. An example of this character is what is wanted. Gentlemen who keep horses, are often terribly at fault, in not supervising their stables. Cases of cruelty by grooms and coachmen are of too frequent occurrence.

HOLMAN.—Antlers with forty-two points are not uncommon. They belong to the black tail deer, and probably came from Texas.

CALDER.—We have heard of the voluntary domestication of the wild pigeon before. That is to say, it remained with the tame flock six months, but if we remember rightly, about the time of the migration of the wild birds, it took wing and never came back.

S. R. N.—Largest of Australian *carnivora* is the Tasmanian wolf, or Zebra opossum, (*Thylacinus cynocephalus*).

GRISON.—Average rain fall in England and in Eastern countries about thirty four inches; in the hilly countries forty-eight to fifty inches. New York is about thirty-six inches.

K. L.—A horse is quite a large one when he weighs 1,200 pounds. Nothing more easy than for you to put him on a coal-dealer's scale and get it to a quart of a pound.

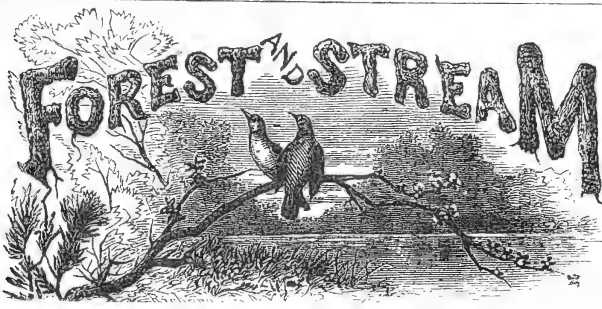

J. N.—Sometimes, when nothing better can be had, a good dressing of wood ashes will keep a skin in fair order.

X. E. X.—There is probably no sporting question so frequently asked as "Childer's" time. He is said to have accomplished three miles in five minutes fifteen and one-half seconds. It is doubted. It seems to be traditional, but very possibly watches were not correct in 1721. Eclipse's four miles in eight minutes, is even more doubtful.

ATKINS.—Glean's book in a few words gives the answers you want. "The size (of shot) which lies the most compactly with the fewest interstices, will give the best pattern and penetration combined." To try this experimentally we have taken a pill box from our druggist, just about the size of the bore of the gun and counted the shot, which exactly lay on the bottom.

FANCY.—A good carrier pigeon, an undoubted bird, will cost you \$25. Some were sold, notable ones, in England lately for no less than £20.

K.—From description would say it was the sage cock, (*Centrocercus urophasianus*). They are found in Arizona and are represented as scarce. Said to feed on wild sage.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

NEW YORK, THURSDAY, SEPT. 25, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their personal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

This paper sent gratuitously to all contributors.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,
Managing Editor.

Calendar of Events for the Current Week.

FRIDAY, Sept. 26.—Albany Fair, N. N.—Waverley Fair, N. J.—Milwaukee Fair, Wis.—Pennsylvania Central Fair, Erie, Penn.—Agricultural Association, London, D. of Canada.

SATURDAY, Sept. 27.—Ridgfield Rowing Association Regatta.—Kingston Regatta, D. of Canada.—Tennessee Central Fair, Murfreesboro, Tenn.—Rowing clubs foot of 133d St., Harlem, New York.—Western Fair, Rochester, N. Y.

MONDAY, Sept. 29.—Cape Vincent Regatta, D. of Canada.—St. Joseph Industrial Fair, St. Joseph, Mo.—Northern Ohio Fair Association, Cleveland, Ohio.—North Missouri Fair, Hannibal, Mo.—Southern Illinois Fair, Centralia, Ill.—Northern Wisconsin. Oshkosh, Wis.

TUESDAY, Sept. 30.—Deerfoot Park, Parkville, L. I.—Dexter Park Club, Chicago, Ill.—Deerfield Valley Fair, Charlemon, Mass.—Central Michigan Fair, Lansing, Mich.—Manchester Fair, N. Hampshire.—Pennsylvania State Fair, Erie, Penn.

WEDNESDAY, Oct. 1.—Southern Pueblo Fair, Colorado.—Deerfield Valley, Charlemon, Mass.—Dexter Park Club, Chicago, Ill.—Deerfoot Park, Parkville, L. I.—Annual Match Toronto Gun Club.

THURSDAY, Oct. 2.—Nassau 28. Analostan Rowing Clubs, Potomac, Washington, D. C.—New York Squadron Regatta.—Cincinnati Industrial Fair, Cincinnati, Ohio.—Northern Ohio Fair, Cleveland, Ohio.—Dexter Park club, Chicago, Ill.

PENNSYLVANIA HORTICULTURAL SOCIETY.

THE Society has an elegant suite of rooms on Broad street, near the Academy of Music, and was opened with great *eclat* on the evening of the 16th. Delegates from every State in the Union are there, representing every floral and pomological society in America, under whose jurisdiction will be placed the land set apart in Fairmount Park for the Centennial Exposition. The Pennsylvania Society rooms have in the centre of the main hall a temple, formed of six magnificent pillars, which, in their turn, are made up of innumerable bouquets, which are presented to the ladies as they leave the society's rooms. In the middle of this temple is a fountain, giving out jets of cologne, and suspended from the interior of the dome are tube roses, camellias, and other flowers, grouped in such a shape as to represent the familiar old Independence bell. The cost of the floral bell exceeded \$200, while the expense of the temple and fountain was over \$1,000. The display of fruit is superb, and contributed from every quarter of the land, but few States having no representation. The names of the parties growing the handsomest fruit are as follows: Mr. G. E. Chamberlain, of Virginia; Mr. M. Thomas, of Philadelphia; Messrs. Ellwanger & Barry, Rochester, N. Y.; Mr. Perkins & Son, Morristown, N. J.; William Thatcher,

Darby, Pa.; Mr. Hovey, Boston, Mass.; Messrs. Smith & Powell, Rochester, N. Y.; and Hollway & Co., California. There is also a table of apples, pears and plums, brought all the way from Utah. The finest collection of pears by all odds is that offered by Mr. Thomas Grigg, one dish of his holding twelve large pears which, upon the scales, weigh just twelve pounds. The fruit stands are arranged in avenues around the room, while the central portion is taken up with plants, flowers, and cut bouquets.

THE CLERGYMEN OF ENGLAND.

WITH questions of orthodoxy, creed, tenet, or dogma, with discussions ritualistic or rational, of High or Low Church, sectarian or dissenting, the FOREST AND STREAM has nothing to do. With due respect to all such topics, inclined to interfere with no man's faith, looking up from Nature to Nature's God, we reverence His sacred name, and think that each leaf which rustles in the forest, or wave which ripples in the stream, unites in the one great psalm of His praise. His ministers, the clergy, have our unqualified esteem. As a class they are hard working, generally poorly paid men, who, indifferent as to worldly goods, strive alone for the welfare of their flocks.

Their spiritual condition is beyond our province. Their physical state, however, we deem as legitimate to discussion in our columns. Taken as a class, our clergymen are not as strong nor as lusty as men following any other of the liberal professions. The life of the student, the immuring in the library, the compilation of the sermon, the attendance in the heated church, the calls made by the clergyman to administer consolation to the afflicted, even trying though they may be, are not sufficient to account for this exceptional low physical condition. This waste of strength arises, we are prepared to affirm, from the want of proper exercise, and certain sedentary habits which are considered by clergymen as obligatory to their profession. There is no question but that this state of things is forced on them. Disinclined as pious men may be to anything like asceticism, they nevertheless are influenced by the opinions of an austere laity. It is, therefore, to the congregations rather than to the clergymen that we address our remarks.

There is still in our midst a remnant of that over severe creed which believes that gladness and cheerfulness are at variance with religion and true piety. Without going to the extreme of Trappists, there are many congregations believing that the least inclination on the part of a religious incumbent to athletic sports, be they of the simplest kind, is ungodly. To them a game of base ball or cricket played by their minister, would be deemed as a profanation, and as to the simple sport of battle-door and shuttle cock, they would esteem it as an expression of triviality of character inconsistent with the sacred character of a clergyman.

Do people think that God's chosen disciples are made of different flesh, blood, muscle or fibre from other men? Are they aware that the same laws of nature govern the bishop, the sexton and the grave-digger?

This frowning down of rational amusements is in itself an inconsistency. They require of their clergyman sermons. They drag from his brain his deepest thoughts; they drain his intellectual faculties to the very last drop, and then refuse him the only method which nature allows him by which he can recuperate his forces, and that is by bringing up the body to the same condition as the brain. They insist on burning the flame, basking in its light, warming themselves in the fervor of its heat, but forget that the elements must be furnished by which only this fire can be sustained. Good sermons are certainly the united products of both mental and muscular fibre. Of course our remarks are not intended for older clergymen, but we send forth this plea of mercy for those young in their sacred calling. Take the minister fresh from his theological school, with the merry shouts of the college campus still ringing in his ear, with the vivid recollections of the boat or the foot race still electrifying every muscle, and drop him into one of those cold, unsympathising congregations of doubtless good people, and mark the effect. The whole being of the man is changed, all those pleasant pastimes, healthful, innocent ones, must be abandoned. The *physique* in time works on the *morale*. Not only does the man suffer, but the glorious fire within him, the better, ever living portion of him, smokes for awhile, at last smolders, and is then extinguished. If we are educating young men for theologians, giving them health and vigor by means of boat clubs and athletic pastimes generally, let us not forget the world in which they are to live.

These remarks, pertinent or not, have been suggested by looking over an English Cricketer's Companion. Here we see among the Gentlemen of England; those whose prowess makes them the best known of the hundreds of thousands who play this noble game of cricket, such names as the Reverend E. T. Drake, Westminster. His credentials are (we copy literally,) as follows: "A destructive slow bowler. Fast run getter, and fine fielder." Then again we notice the Reverend C. D. Marsham Bucks, "once famed as the best gentleman bowler, and still a good player." There are fully a dozen clergymen cited as cricketers, with all their various points of particular excellence distinctly mentioned. Does any one dare, with a Philistine spirit, to declare that the learning, piety or broad christian humanity of these gentlemen is impaired? Does it take a little from their reputation because their names are heralded as lovers of a manly sport. Suppose for a moment such a publication was made in the United States in regard to a clergyman who was a good cricketer. There would be a cry of horror raised throughout the length and breadth of the land, and

all *les convenance*, secular, temporal and clerical, would be horrified.

Some time ago, a huge steamer full of men, women and children, struck, one dark night, on the rocks near Halifax, and hundreds of human beings struggled in the water for their lives. Who was it but a clergyman who launched his frail skiff into the surges and came to the rescue? Would rigid church disciplinarians have found fault with him then? It was not brute strength alone which kept the clergyman's boat afloat, there was skill in it too, those whipcord muscles of his which drove the craft through the whirls of foam had had long prior training; above all, there was a brave heart which sent him on his perilous way. No man could have performed a feat of this character unless with a body inured to muscular strain, and certainly this good clergyman must have rowed many a mile in his life for sport.

All men, whether they be of God's anointed, or miserable sinners, must sometimes be placed under just such emergencies, when not only their own lives but those of others may depend solely on their physical powers. But putting aside this view of the advantages derived from wholesome exercise, it seems to us as if smacking something of absolute cruelty to debar so many of our fellow beings because they are clergymen, through inconsiderate clamor, from enjoying the many advantages to be derived from rational amusements.

We sincerely trust the example given by English clergymen, who do not lose any of that proper respect which should always be attached to their calling, will find followers among our own ministers.

EFFECTS CAUSED BY PLANTING TREES.

IN a late number of the *Courrier d'Oran*, we find the following: "Though the period of the conquest of Algeria is of comparatively recent date (1829-30), everything seems to prove that, since trees have been planted, water sources have almost doubled, and in some cases quintupled in certain localities. The effects of a climatic change seem even probable. There is more moisture in the air, and every year the rain fall is more abundant."

What more convincing proof can we have than this example? In less than thirty years—for the subjugation of Algeria by the French was hardly completed before 1845—a country known to have been arid, and wanting in water is to-day, by the planting of trees, blessed with copious rains, flowing streams, and consequent fruitfulness of soil.

We are seeking to-day to double the capacity of our canals, and Senate Committees on Transportation are deliberating how best they shall utilize the waters of Lake Champlain and the Hudson, and such serious questions of supply of water naturally present themselves.

If we are to depend on unlimited sources of water, we must look at the prime causes of the supply. Legislators would do well to consider all these subjects, theoretically and practically, and the preservation of the forest in the upper portions of the State ought not to escape their notice. There should be no near-sighted policy about it. Works of the character proposed, a broad water channel, which shall bring to us the great grain crops of the West, are to be constructed, not only to suffice for the wants of the present citizens of the United States, but for generations yet to come. We assert that in the grand study of political economy, with particular reference to our country, there is no question so vital to its general interests as the preservation of our forests.

DUCKING ON 'CHANGE.

THE equinoctial storm of Friday, September 19th, was most disastrous on 'Change, flooding the ordinary channels, until it overflowed the banks, washed out the stools of speculative sportsmen, swept off their decoys and blinds, and submerged the favorite haunts of the game itself, so that they were unable to cover. Indeed the flood came so suddenly and raged so fearfully, that when it had partially subsided, it left many lame ducks along the margins of the numerous pools and high and dry among the rushes on the banks. Many old sportsmen who were wont to place implicit reliance upon the "points" of their favorite retrievers, found them now without a scent and utterly powerless to recover the fortunes that were carried down stream. Empty were the bags that day, and few the "flyers" that the most successful sportsmen were able to wing or bring to hand. The encouraging sounds of "puts" and "calls," as the well trained retrievers were alternately sent to cover and re-summoned, were seldom heard, and the only words that fell upon the ear were the grating syllables "Down—Charge!" In fact, the sportsman had no option in the matter. He could only stand quiet and tearfully watch the precious things that took to themselves wings and flew away or passively sunk in the seething current.

The mortality among the ducks, jays, geese, and snipe, is almost unaccountable, but is supposed to have been partly due to the fact that the flood left but few deposits upon the banks, and that consequently they became weakened from lack of feed and natural sustenance. Moreover, what has been regarded the safest and best security proved but a sorry refuge, leaving them to the pitiless chances of the market and the slaughterers of stock. It is useless, however, to venture an explanation or enter into details. The "long" and "short" of it is, that the disaster was overwhelming, and its effects likely to be felt for a considerable time to come.

Ladies' sporting ornaments—Hare nets and scull-pins.

THE HERONS.

IN reference to an article lately published in the FOREST AND STREAM on the depredations of the Night Heron, commonly known as the "Quawk," (*Nyctiardea Gaudenii*), we give the following history of the Herons, in reply to several letters which we have received from different quarters, mentioning like depredations committed by the Great Blue Heron, (*Ardea herodias*.)

All Herons are nocturnal in their habits, although they sometimes feed during the day, particularly late in the season. They are all provided with their natural lantern, which they use with great success. There are sixteen species of Herons found in the United States. The largest and most powerful of these is the great Blue Heron (*Ardea herodias*) and Florida Heron, (*Ardea wardemanni*), which greatly resemble each other in size and color, and by some naturalists are considered as one species, although they differ widely in their distribution. The great Blue Heron ranges from Canada to South America, and from the Pacific to the Atlantic ocean, whereas the Florida Heron only occurs in the Southern States. They are both gormandizers of the first water, and devour fish, young birds, mice and marine insects without distinction. The next in size and the most beautiful of the larger Herons, is the *Audubonia occidentalis*, (great White Heron.) This is indeed a magnificent bird. When standing it is full three feet high, and as white as snow, making it a very conspicuous object when standing on the bank of a river, or when wading on the flats. The beautiful white plumes often observed in ladies' hats, are taken from the back of this bird. The great White Heron is found throughout the southern United States, but is most common in Florida. The next in size is the California egret, (*Herodias egretta*), a close relative of the *Audubonia occidentalis*, and an inhabitant of southern California and the southern States. Its plumage is white, and its bill is very long and of a yellow color. Its back is furnished with plumes in the adult stage of plumage. The bittern, or stake driver, (*Botaurus centiginosus*), is commonly found throughout the United States, and is one of the most widely distributed of birds. He is a quiet, peaceful fellow, who lives in the marshes and preys upon small fish, frogs, aquatic animals and mice, but should you break his wing by a chance shot, you will find him a formidable and determined enemy. With drooping wings, and with plumage erect, and neck drawn back until nothing is visible but the sharp beak and small yellow eyes, he will attack you savagely with his bill until he is laid low from a blow with your ramrod. The bittern differs from the rest of the Heron family in being more diurnal in its habits, and laying its eggs on the ground.

The Night Heron (*Nyctiardea grandenii*) is found in every State in the Union, and is a very numerous species. They breed in colonies, generally in a dark swamp, where they retire during the day, but as night approaches they become uneasy, and when it is fairly dark they leave their roosts singly or in pairs for their favorite sand bar or mud hole, there to stand on one leg as immovable as stakes to strike their unwary prey, that glides beneath them. These are the birds that utter the sudden "quak" directly over your head when you are sitting quietly fishing some summer evening. The Blue Heron (*Florida caerulea*) is a resident of the southern United States, and is most numerous about the lagoons of Florida. The different stages of plumage of this bird would greatly deceive the amateur collector. The first year its plumage is pure white, the second year the ends of the primaria, or wing feathers, and the scapulars, or back, are blotched with a blueish tinge; the third year the blue on the wings, rump, and crest becomes more conspicuous, and the fourth year it has the adult plumage of a purplish blue. The Louisiana Heron (*Demigretta ludoviciana*) is another southern species found abundantly in Florida, and is distinguished by its long, slender neck and beak, being rather a lighter built bird than the other herons. The Louisiana Heron is bluish on the upper parts, whitish underneath; the plumes of the back are a bluish brown color, and its head is adorned with a pendant crest composed of five or six white feathers. This is the most active of its tribe, and pursues its prey with great rapidity. The White Heron (*Herodias egretta*) is rather a larger species, with a pure white plumage, and in all probability the adult of *Herodias Californica*. The snowy Heron (*Garzetta candandissima*) is a resident of the Gulf States, and is seldom seen further north than Virginia. This species has not an equal for beauty among the smaller herons. It has a bunch of snowy plumes on its back, and when the plumes are erect, they give the bird a magnificent appearance. The Seminole Indians of Florida often rob the snowy heron of its plumes, which they wear as an ornament and sell for a high price. The Peales Egret (*Dermigretta peali*) and Reddish Egret (*Dermigretta Kufa*) are peculiar to the Southern States, and are not so abundant as other species; they breed in company with other herons, but occasionally form small colonies of their own. The Yellow crowned Night Heron (*Nyctherodius violaceus*) is a solitary species frequenting the bayous and lagoons of Florida. This species is rather common on the Indian River and its tributaries, and is strictly a Southern species. The Green Heron or Poke, (*Ardea virescens*) is perhaps the best known of its genus and is a common resident in every quarter. The millpond, canal, river, creek, marsh and brook are all the home of the Pokes, where they are often seen feeding during the day. The Green Heron breeds in single pairs or in small colonies, according to the number there may be in one locality. Where there are extensive marshes they are generally found in communities. The Least Bittern (*Ardetta exilis*) is the

smallest of all the herons, standing scarcely eight inches high and greatly resembles its big cousin, the Stake Driver, in plumage. When wounded it immediately skulks in the grass or rushes, and remains concealed and will not remove unless kicked over by the foot of the hunter. It is not a common species, but stragglers are found all over the United States. The herons are all gregarious and excepting the Bitterns build their nests in trees. Their eggs resemble each other in color, being nearly all a pale green. Their nests are composed of sticks laid carelessly on a horizontal limb, where it is often blown off by the wind, or their eggs rolled out of it to be broken on the ground below, where they are devoured by crows, or skunks.

NO MORE DESERTS.

JUST as our gazetteers have to be remodelled every year, so have our geographical charts to be changed. If Prussia for the last decade has been the horror of map-makers, now that railroads are stretching out their long feelers, how much more rapid are the alterations they have made in topography. Our school days are not so far distant but that we remember that mysterious locality pitched somewhere midway between the Rocky Mountains and the Mississippi, called the Great American Desert. If Africa rejoiced in a Sahara, reasoning by analogy, map-makers gave us one.

Writers of twenty years ago applied this term to whole sections of country, somewhere about the hundredth degree of west longitude. That a barren waste does exist about this locality, no one doubts, but recent research has very much curtailed its area. Dr. Cyrus Thomas declares that the barren district runs through the centers of Dakota, Nebraska, and Kansas, just skirting the western portion of Indian Territory and Kansas. The question which most occupies our attention, is the one which scientists are now discussing in regard to the exact temperature of these barren regions, and the rain falls. Dr. Thomas seems to have paid the closest attention to these meteorological conditions, and has pretty nearly determined that west of Cheyenne, the average rainfall is not sufficient to produce vegetation. The soil, he states, is good, excepting were over-impregnated with alkali. As to rain-fall between 1867 and 1871, the average rain-fall was only 14.09 inches, less than half that of Iowa or Minnesota, while in Nebraska the average for the same period was 31.47. The *New York Times*, in treating of this most interesting subject, says:—

"The Great American Desert, independently of any mineral treasures it may possess, is not the useless wilderness represented to be, neither has it everywhere the richness that is found in Iowa and parts of Minnesota. Where it is less adapted for the plow it may be well suited for pastoral purposes, the spots that are the least useful being only to be found at intervals, and nearer to the foot of the Rocky Mountains."

What is wanted in this country is evidently tree planting. That all these arid plains, thousands of years ago, were covered with trees seems to be highly probable. From their laying flat, the forests, once on fire, were consumed to the very last tree. In Nebraska the people seem to be wide awake to the necessity of not only drawing the water from the clouds, but of keeping it there by tree culture. One farmer in Nebraska, two years ago, planted 120,000 trees, and the State, under certain conditions, following out Dr. F. B. Hough's admirable ideas, exempts from taxation the property of settlers who cultivate trees.

Is it too much to imagine that the time will come when all these arid wastes will be reclaimed, and bloom again like a garden? When fertilizing rains shall fall once more and make the desert an oasis? Data on such subjects, giving man's mastery over climate and even soil are perhaps wanting. That sections of country have been reclaimed is very evident. How many centuries of civilization it has taken, we have no means of determining. But if we argue the opposite way, starting from data of countries once green with foliage, dense with woods, abounding with streams, but to-day scorched and arid wastes, uninhabited by bird or beast, the examples would be plenty. We can destroy much more rapidly than we can create. Isolated efforts, then, of tree planting may in time be effective to reclaim this desert, but what we must again urge, is collective legislation, making it imperative on all settlers to plant trees in the neighborhood of the so-called American Desert.

CAN THE JELLY-FISH SUSTAIN LIFE?

IT would be an experiment worth trying to determine whether the *acalepha*, or Jelly-fish of the ocean could sustain life, when taken as food by castaway mariners. They certainly do not contain much solid substance, but that little must be nourishing, for many fish live exclusively on them. All the herring family, including Shad, Menhaden, and the smaller species live on nothing else. We have seen the Menhaden feeding on a species of Jelly-fish the size of a pigeon's egg, in Jamaica Bay. The pearly iridescent Jelly-fish were drifting with the tide, and the glistening Menhaden were darting in every direction after them, flashing in the sunlight, or suddenly disappearing as their sides or backs were seen. We shall not soon forget the sight.

The flesh of the Herring tribe is peculiarly rich, oily and nutritious, and must be entirely composed of the solid parts of the Jelly-fish, chemically changed by digestion. If these creatures can, therefore, sustain life, the fact ought to be generally known.

Another point to be determined is whether the Jelly-fish would not also supply the thirsty mariner with all the fresh water he might need, when in distress. We cannot affirm

it as a fact, but we believe that these fish contain little or no salt, and that their transparent and soft substance is chiefly composed of fresh water.

If they should prove to be a sufficient substitute for meat and drink, the ocean would be divested of part of its terrors, and we should no longer hear harrowing tales of the sufferings endured by the survivors of foundered vessels, leading to the extreme necessity of eating each other. The ocean is alive with numerous kinds of Jelly-fish, from the huge *quawl* or medusa, and the *Portuguese man-of-war*, to the minute atoms that cause the phosphorescence of its waters when stirred by the wind, or by the vessel ploughing through it. Some are in bead-like chains, as large as a pea; others are in the shape of an egg, while the largest are formed like a mushroom, with a fringe of long, thread-like appendages around the margin of their disk. These threads each contain a wonderfully contrived stinging apparatus, consisting of a microscopic harpoon, beautifully barbed or serrated, connected with a coil of thread, that brings the little weapon back to its sheath after it has been darted out at any object touching the sensitive tentacles. These *stinging quawls* are well known on our coasts, and they reach a very large size, more than a foot across the disk, and several inches in thickness. Of course these tentacles could be cut off when they are eaten, as the minute harpoons might cause an irritation of the stomach.

Those who traverse the seas know that hardly a day passes without meeting a long streak of Jelly-fish, drifting with the winds or currents, and a castaway could dip out all that he wanted by the aid of an old shirt tied up at the arms and neck, and towed through such a floating mass of them.

At times, millions of small Jelly-fish are cast up on the beach, and the bather, at such times, feels as if he were swimming in pea-soup. We have often been tempted, at such times, to try them as food, for the late Commodore J. B. Nicholson assured us that he had done so, and that they were harmless, and nourishing, though tasteless.

We cannot enumerate the larger species of *acalepha*, nor dilate on their marvellous methods and powers of reproduction. Many have devoted much attention to this subject, and Professor Agassiz has done more than all others in clearing up their history.

We claim no originality for the above proposed experiment, but we cannot find that the subject has ever been noticed before.

FOL DE ROL.

THERE is an amusing article in a late number of an English magazine, in regard to the chorus of songs, with a "down, derry down," and a "fal, la-la" and "a high nonnie, nonnie no," and a "hey cum trix," and other refrains of songs, where the erudite reviewer exercises, if not extreme philological lore, very certainly most ingenious processes of reasoning, worthy of a Max Muller. Cease then, ye roysterers, around the table, or ye night revellers, your profanation of "tooral looral;" give it rather an intoning deep and solemn, for you are (says the reviewer) almost on the verge of a sacrilege, for know then, ye boisterous gallants, that "tooral rooral" is Celtic or Gaelic, that "tooral" is the Gaelic *andante* or slow movement and "rooral" the Celtic *presto* or quicker movement. Harp music probably in that early time had technical terms similar to those used to-day for the piano. All these refrains, so it seems, were used by the Druids to commemorate some portion of their worship. Let us take a rather ludicrous example of this. There is a song called the "Friar in the well," with the chorus "fal-la lanky down dilly." Now *lanky* and *langtre* are one and the same thing, the true reading should be "fal la-lan-ri-dun-dill," meaning "the circle of the day is full, let us go to the hill of *rain*." Rain it seems must have been held in high estimation by the Druids. Possibly there were umbrella makers among them, because there is another burst of songs, ending with a "hie dildo-dil," which is resolvable into, di, dill dum dile, or "welcome to the rain upon the hill," which the chorus commentator says was a thanksgiving for rain after a draught.

Now, no one doubts but that "ri-um, ti iddity tiddity," must have had a forefather, but man's ingenuity can take it so far beyond Druidical times, as to place it in the Sanscrit. The oldest chorus is the Greek one. "I-ho! I-ho!" which is distinctly traceable to the old parent races of the Hindoo. "Hey-lillie-ho-lallie" is almost as old, perhaps taken from the Saracen. A confused jumble of Il-allah, and "sing fol-de-rol-de-dee" and "diddledum-di and diddle dum do," may be for ought we know, derived from church canticles, when choristers sang their do-re-mi-fa, &c., Of course we do not mean to laugh at such erudition, nor be classed with Sydney Smith's friend, who despised the equator, and made a joke about the pole, but occasionally the exact difference between what is far fetched and ingenious is somewhat difficult to determine.

Take one of our negro choruses, for instance, "I am going to leave you—good by, Eliza Jane." This may be rendered—"I'm gwine to leave yer—Lize Jane." Apply Grimm's rule to it, and you have the most curious and startling effects. An ingenious friend worked on it for a week, and at last having carried it through the most elaborate squeezing and twisting, got it to read from the Sanscrit. "The horse of the sea lapped the water," which fact we trust will render Hooley classic for the future. Perhaps some of our readers philologically inclined, can give us some other choruses—native ones, elaborately worked up. There are word hoaxes at times, quite as plausible as the best practical jokes. But to treat such matters seriously,

such impalpable things as words have immense powers of resistance. Something like diamonds, far tougher than the surrounding drift, they have never been ground to pieces. They have kept hard, brilliant and concise, and have come down to us from a period so far distant, as to be perhaps beyond the ken of man to determine their precise age of formation.

COOKING GAME.

HENRY WATTERSON, of the *Louisville Courier-Journal*, has been writing some very clever letters from abroad. Among the many good things he says, paraphrasing the well-known quotation of "painting the lily and gilding fine gold," in regard to cooking game he uses this terse apothegm: "Truffles do not improve woodcocks." Sentence fraught with wisdom, and worthy of a Brillat-Savarin! The Louisville editor does not relish on the whole the French *cuisine*, and takes Edmund Yates as an authority about our American cookery. Of Yates, he says: "I heard Edmund Yates remark last winter—and whatever you may think of Edmund's novels, if you have ever met him, you would allow that he has a belly of unqualified culture and genius. I heard him say last winter that the Brevoort House, meaning, of course, the kitchen, is the best hotel in the world."

In subtle gastronomic discriminations you can find no more able analytical powers than those possessed by literary men. That delicate shading between the *gourmand* and the epicure, they fully appreciate. If the immortal Thackeray was illustrious as a novelist, incomparably great was he in his table *diletantism*. Think of his saying, as he ate his first oyster at Fulton Market, in the presence of the late departed Drolon, who, on asking him how he liked them, replied, in a Johnsonian way: "Sir, I feel as if I had swallowed a baby."

What more just than Mr. Watterson's remarks on the bad taste of eating spoiled game, and we may properly quote Churchill, who says that "the sooner a bird or fish is eaten after it is taken the better."

A *salmis de becasse*, of course, is a thing not to be despised, only it is an ingenious method by which a spoiled woodcock may be so disguised by a sauce, that you have no comprehension of the real flavor of the most delicate of birds. Tastes are fashions. The gamey twang, or what is called in French the *phaesandee* flavor, only became *a la mode* when it was impossible to bring game rapidly to market, and the length of time used in transportation caused absolute decomposition. It then became necessary to invent methods of making food palatable, which otherwise would have been repulsive. Of course the season of the year has much to do with this question, but we are still in doubt whether a canvass-back duck in dead winter, is not better, when cooked a day after it is killed, than when kept frozen for a week.

News from Abroad.

TOM FRENCH, the famous English jockey, is no more! The name of a certain Greek rider, who rode his horse to victory, some 2,300 years ago, has come down to us. Perhaps the old Greek knew perfectly well how to nurse his mount, to follow instructions, and to get the "last ounce" out of his steed, foaled, may be, in

"Grassy Argos,"

"Famous for its steeds of fire."

How the Greek Jock died, however, never will be known. Was it of old age? or did he, on the home stretch, driving his chariot too fine, strike the brazen goal with his whirling wheels, and have his neck broken? Certainly the old heathen Greek could never have died the death that Tom French did. Perhaps they had no *post mortems* in the heroic age, as they have now in our more prosaic times. The cause of this man's death, Dr. Meade, the physician who attended him, states, arose "from that wasting and exposure and irregularity of diet, consequent to his profession." Superficially read, this may mean but little, but when leading English journals declare that French died a victim to the ill effects of severe training, necessary to enable him to ride at the present state of weights, the matter assumes a much graver appearance. There are two points to be looked at in discussing this subject: The question of the man and that of the horse. It may seem strange, but the *FOREST AND STREAM*, contrary to usual sporting precedents, is inclined to take into consideration the question of that insignificant creature, the man, first. There is something cruel in the idea of training down a man to a mere skeleton—"a ruckle of bones"—in order to fit him to ride up to feather weight. It means the destruction of the human being. Jockeys are sometimes sweated with their horses, in order to reduce them both in flesh. There need be no great outcry made about this up to a certain point, as when a "logey" or heavy rider must be reduced a few pounds; but when it comes to dwarf human beings, when jockeys are required at that period of life when the body fills up, to go on, sweating and reducing themselves until they die from this unnatural treatment, then, even in Christian England, such practices should be decried. Now, secondly, about the horses: An English journal says, speaking of the deterioration of the thorough-breeds, and the methods advocated for their improvement, that the carrying of weights by racing horses ought to be approximated to the weights the horse, in ordinary life, is expected to carry.

Now, the question naturally arises, "What possible sense can there be in raising horses which can only attain speed when ridden by human mannikins?" In this era of ad-

vanced ideas, when we breed finer every day, running horses at tender ages, when they should not be worked at all, perhaps we may require not men, nor even boys, but monkeys, to land some swift, but fragile racer, to the winning post. Feather weights in England demand, sometimes, minimum loads for horses. We have an example of this in Kitchener, who, some twenty years ago, weighing 56 pounds, a boy, it is true, won the Chester Cup.

—If grouse have been scarce, and with a return of better judgment their lives have been pretty generally spared for another season, partridges have turned out somewhat better, so that sportsmen have received somewhat of a compensation. Just now, however, this gamey bird is in the stubble, and it may be some time before he leaves it. Pretty generally, however, partridges seem not to have been so plenty, and it is highly probable that the season will not be a good one. It is early for partridges just now in England, and many sportsmen never draw covers before the middle or close of December.

—Of cricket, many notable matches have just been played. The Gloucestershire and Sussex match was a remarkable one, in which the two leviathans, the Graces, figured. A Mr. Townsend made 163 runs. Of course, the side the Messrs. Graces were on won the match, which was with the Gloucestershire men. It is calculated that, had the score of the full match of the winners been carried out, they would have summed up 1,700 runs. The wonderful play of certain men at the bat, somewhat inclines one to think that the day may not be far distant when certain modification, even in the conservative game of cricket, may be necessary even in England. The remedy would be found in adding a fourth wicket, and making the stumps at least some four inches higher. What is certain is, that batting is now beating bowling in England.

—We are pleased to cite quite an increase, in fact an enormous one, in the grand total of those angling matches, which we have noted from time to time. Here is the Grand Angling Sweepstakes of Lincolnshire, 600 men, with a whole jungle of fishing-rods, and may be a thousand miles of line, and a ton of hooks, fishing in a canal. The winner caught 11 pounds 11½ ounces, beating an equally clever rival by exactly the weight of a minnow scale. Anglers generally, in England, are amazed at this startling result, when in prior years a gross weight of three pounds four ounces secured the prize.

—English amateur coaching is now almost at its conclusion, and may be said to have been moderately successful. Pleasure seekers at Brighton conclude the season by rattling up to London in a coach and four, driven by a baronet. There may be some particular satisfaction in an English tradesman, when he is conscious that a nobleman coachee handles the lines. One can gather from the notices of the coaching horses put at public sale, the price of these animals in England. A good hack fetched £60 to £70, and a cab or omnibus horse, £35 to £40.

Shot Gun and Rifle.

GAME IN SEASON FOR SEPTEMBER.

Moose, <i>Alces Malchis.</i>)	Caribou, <i>Tarandus Rangifer.</i>)
Elk or Wapiti, <i>Cervus Canadensis.</i>)	Red Deer, <i>Caracus Virginianus.</i>)
Rabbits, common Brown and Grey.)	Squirrels, Red Black and Gray.)
Wild Turkey, <i>Meleagris gallopavo.</i>)	Quail, <i>Oxyechus Virginiana.</i>)
Woodcock, <i>Scolopax rusticola.</i>)	Pinnated Grouse, <i>Tetrao Cupido.</i>)
Ruffed Grouse, <i>Tetrao umbellus.</i>)	Curlew, <i>Numenius Arguata.</i>)
Esquimaux Curlew, <i>Numenius borealis.</i>)	Sandpipers, <i>Tringine.</i>)
Plover, <i>Charadrius.</i>)	Willetts,
Godwit, <i>Limosa.</i>)	Reed or Rice Birds, <i>Dolichonyx orizivon.</i>
Rails, <i>Rallus Virginianus.</i>)	

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

One of the best localities within a fair distance of New York for ruffed grouse shooting is called the Cannape. It is a large extent of wild territory situated on the north-east corner of Ulster county, New York. Take Hudson River railroad for Kingston, which connects with the New Rondout railroad to Shokan, which is seventeen miles. The distance from Shokan to Watson Hollow is seven miles. Stop over night at C. Rockwell's, who will every give information and send a guide or go himself. This country is quite unknown to the sportsmen, as we firmly believe. There has never been a breech-loader or a setter within its limits. The scenery is grand in the extreme, and the berries which the ruffed grouse feed on, are very abundant. This territory is also noted for its deep mountain gorge, at the head of which is a beautiful lake, the head waters of the Bushkill creek. It has two outlets, one emptying into the Esopus creek, and the other in a directly opposite quarter, into the Susquehanna.

—North Alabama is one of the finest hunting regions in the United States. The fields are filled with quail, the woods with wild turkeys and deer, and all the streams and ponds in winter abound with wild ducks and geese. The finest wild-geese shooting in America is to be had every winter in the Mussell Shoals in Tennessee River. The wild geese congregate there by the thousands, apparently to feed on the periwinkles that abound in the shallows, as well as on the long moss that covers most of the rocks in the river's bottom. The shoals are about five miles wide, and filled with small islands, called "tow-heads." Most of these tow-heads are covered with drift wood, in which the sportsmen

conceal themselves, and shoot the geese as they fly over, which happens every few minutes, as they are constantly being disturbed by one cause or another. Just before night-fall the geese leave the river for the fields and ponds, which affords the sportsman another good opportunity for rare sport. What is true of the wild geese, is more or less true of the wild ducks, with this in addition, that the latter are to be found every where, all the winter through, filling every point, "spring branch," or creek. Wild turkeys abound everywhere, and the red deer almost everywhere. The deer are hunted with hounds.

—Smyth County, Virginia, on the western slope of the Alleghanys, is one of the finest game districts easily accessible to the sportsman. Bear and deer are found there, and wild turkeys, grouse, quail, and woodcock are abundant. We hear of one bag of seventy-five quails secured in a single day by G. E. Penn, Esq. There is good hunting all about the neighborhood of Marion, the county seat, and accessible therefrom by good mountain roads. Marion is on the Virginia and East Tennessee Railroad. There are three good hotels in the town. We shall refer to this district at greater length in subsequent numbers.

—The southern part of Wayne county, Indiana, is another good locality for small game, such as squirrels, rabbits, and quail. Here are several packs of dogs, and in winter great sport is enjoyed in "circling" foxes, and in hunting coons at night. As many as seventeen foxes were destroyed by the farmers last winter in the course of a single circle. The trespass laws are rigidly enforced in this county. Centreville is the nearest railroad station. Very good hotels in Centreville.

—The Leather Stocking Club, of Oswego county, New York, we have every reason to know, does honor to the distinguished name it bears. Its officers are: H. C. Tanner, President; M. L. Marshall, Vice-President; N. W. Nutting, Treasurer, and J. F. Miller, Secretary. There are several well-broken dogs in Oswego county, comprising fine breeds of setters, hounds, and pointers. There is fair shooting throughout that section, and the game, beside foxes, is confined to birds, of which duck, snipe, plover, woodcock, partridges and pigeons are the chief. Four railways from Oswego traverse this region.

—On the Montezuma Marshes, in Seneca county, and in the adjacent country, there is good woodcock, partridge, quail, snipe, and duck shooting; also coon hunting. These grounds are within three to five miles of the nearest railway station, and can be reached by way of Waterloo, on the New York Central Railroad.

—Messrs. G. A. Sickells, T. E. Smithson, John Dowel, and John Lannon, of Washington, returned last week from a three days' gunning expedition to the Patuxent River with 2,162 sora, besides a large number of reed birds and some blue wing and summer ducks.

—We give these bits of information in hope that such of our readers as may be able to avail themselves thereof, will be induced to render us an equivalent by sending some account of their experience and their impressions of the localities visited.

—The sora of America do not enjoy the same immunity from sportsmen's attacks as do the birds of Japan, as we learn from "Sir Rutherford Alcock's Residence in Japan." He writes:

"On the surface of the pond, are myriads of wildfowl so conscious of their immunity from gun and dog, under imperial decree, that they allow you to approach within a few yards—a most aggravating sight to a sportsman, but such is the law, and the birds evidently know it. No shot at bird or beast may be fired within tenri, or thirty miles, of the Tycoon's residence; and Yokohama, alas! is only seventeen miles distant. To the Japanese probably it is no privation; but to an Englishman, sick of pork and fowls all the year round, and eager for open air sport and exercise, it is very hard; but the Japanese officials seem to take all the more pleasure in vigorously insisting upon the inviolability of the laws. Their artists equally excel, from long and loving study, in depicting all kinds of wildfowl. Hawking seems the only sport in vogue even among the privileged and higher classes, and that in the imperial domain is strictly limited likewise to the Tycoon. No private individual, so I am told, may even keep a falcon, of which there are some very fine specimens. This is only one of the numerous petty restraints and restrictions arising from a totally different state of society and political organization—of a more or less irritating and vexatious character—to which foreigners must perforce submit who take up their residence in Japan.

—A number of gentlemen, members of the Brooklyn Gun Club, met at Dexter's, L. I., last week, to try, for the first time, shooting from five traps, five yards apart, use of both barrels, English rules, handicapped. The birds were better than the general average, and the shooting, considering the long distances, and the first trial of many of the members at five traps, was remarkably accurate. The following is the Handicap:

H. S., 27 yards, shot with Purdy, C. F.—1 1* 1 1 0 1 1* 1 0 1 1* 1 1—13.
W. S., 25 yards, shot with Pape, C. F.—1 1 1* 1 0 1* 0 0 0 1* 1 1* 0 0—9.
Dr. W., 27 yards, shot with Powell, C. F.—1 1* 0 0 1* 1* 0 0 1 0 1* 1 0 0 1—8.
Dr. A., 27 yards, shot with Scott, C. F.—1 1 1* 1 0 1 0 0 0 1* 1* 1 1—11.
Capt. A., 30 yards, shot with German, M. L.—0 0 0 1* 1 1 0 0 1* 1 1* 0 0 1—8.

(*) Denotes killing with second barrel.

—Mr. Harvey H. Brown of Cleveland, Ohio, an amateur pigeon shooter, and the winner of the Lorillard badge at Saratoga, in a letter to the *Herald*, after making some remarks as regards the conditions of the badge, &c., very properly says:—

"I have no present desire or intention to engage in trap

shooting otherwise than as a source of amusement and recreation, and am always ready, my business permitting, to meet in friendly contest any gentleman who may wish to try conclusions with me, but not for the purpose of pecuniary gain.

—There has been a great deal of shooting at Creedmoor during this last week, and the ranges have had occupants almost every day. No match of any importance has however taken place. Members of the First, Ninth, Twelfth, Twenty-second, Twenty-ninth, Seventh and Fifth Regiments, have all been practicing, and the average shooting for green hands, was quite creditable.

The Fifty-fifth Regiment, 250 strong, met at Creedmoor on Monday last; shooting was at 200 yards. The team of the Ninth Regiment did good shooting at 200 to 500 yards. The Twenty-second Regiment team did well. The Twenty-third Regiment team had new guns, but did fair shooting. The Seventy-ninth's team, averaged 13 at 500 yards; 16 at 200.

Rangekeeper Higgs, from the Wimbledon range, made 18 out of possible 20 at 500 yards, using the Remington sporting gun.

It is now a question of taking the best shots in order to select teams for the October contest. The men of the various regiments are commencing to take a decided interest in their shooting, and seem to seize very quickly the various points, which have to be studied, in order to secure success. Besides practice in the field, the use of targets for aiming drill which can be tried at home, will be found most useful. On Saturday last there was no regular match, though general firing was in order.

—We must not be too sanguine of our skill as riflemen, and may have yet a good deal to learn. A Mr. Sanders of the Dublin Shooting Club, made this month the following remarkable score, winning the prize. Distance eight hundred, nine hundred, and one thousand yards, seven shots at each range, Mr. Sanders winning the cup with a total of eighty—at the three ranges as follows:—800 yards, 26; 900 yards, 26; 1,000 yards, 28; total, 80.

We give a short resume of the prizes to be shot for at the First Annual Prize Meeting of the National Rifle Association, to be held at Creedmoor, on October 8th. It may be a week perhaps before the whole number of contests are decided.

JUDD PRIZE.—Weapon, military rifle; distance, 200 yards; five rounds; entrance fee, one dollar; eight prizes, value, \$205.

SPORTSMAN'S MATCH.—Weapon; any kind of rifle; distance, 200 yards; five rounds; position, standing; seven prizes, value, \$525; (among them a pair of splendid moose antlers, handsomely gilt, presented by FOREST AND STREAM).

FIRST DIVISION MATCH.—Open to teams of twelve from each regiment or battalion of the First Division of the National Guards, S. N. Y. Weapon, Remington rifle; distance 200 and 500 yards; five shots each distance; position, standing at 200 yards, any position at 500 yards; entrance fee, one dollar each man. Twelve prizes, value, \$455.

SECOND DIVISION MATCH.—Open to teams from regiments or battalions, Second Division National Guards, S. N. Y. Weapon, Remington rifle; distance, 200 and 500 yards; five shots each distance; position 200 yards standing, 500 yards any position; entrance fee, one dollar; nine prizes; value, \$380.

ARMY AND NAVY JOURNAL MATCH.—Open to teams from all military organizations in the United States, including regular army, navy and marines. Weapon, any military rifle; distance, 500 yards; rounds, seven; position, any; entrance fee, one dollar; ten prizes; value, \$985.

ALL COMERS MATCH.—Any rifle; distance, 500 and 900 yards; seven shots at each distance; position, any; entrance fee, one dollar; ten prizes; value, \$180.

STATE PRIZE.—Open to teams of twelve, from any regiment or battalion of National Guards in the State; distance, 300 and 500 yards; weapon, Remington rifle; State medal; rounds, five; entrance fee, one dollar; thirty prizes; value, \$3,175.

GATLING MATCH.—Open to teams of twelve from each regiment or battalion of the N. G., or the State. Weapon, Remington rifle; State medal; distance, 500 yards; rounds, seven; position, any; entrance fee, one dollar; ten prizes; value, \$2,235.

NEW JERSEY MATCH.—Open to teams of twelve of the National Guard of New Jersey; distance, 200 and 400 yards; five rounds each distance; standing at 200 yards, any way at 400 yards. Weapon, any rifle prescribed by the Governor of New Jersey; Four prizes; value, \$200.

RAILROAD MATCH.—Open to members of Rifle Association; open to all save winners of the *Turf Field and Farm*, amateur club badges; distance, 500 yards; Weapon, any military rifle; position any; rounds seven; nine prizes; value, \$343.

SHARPSHOOTERS' CHAMPIONSHIP.—Open to all; any rifle; range, 800 and 1,000 yards; seven shots at any distance; position, any; entrance fee, one dollar; nine prizes; value \$175.

PRESS MATCH.—Open to representatives of the press; distance, 400 and 500 yards; position, any; five rounds at each distance; five prizes; value, \$140.

Aggregate of prizes, \$8,298, 128 in number. The regulations governing the match will be in accordance with the rules laid down by the National Rifle Association.

LIONS IN ALGERIA.—The Tell, a province in Algeria, is ravaged by between 700 and 800 lions. Each costs in oxen, horses, mules, camels, sheep, and goats 3,600 francs per annum. Its average life being thirty-five years, the damage which it occasions in all is 126,000 francs. Gérard, the great lion hunter, put the figures higher, as he took the annual sum at 6,000 francs, and the total at 210,000 francs. The Arabs, with a view to driving away those dangerous beasts, have already destroyed a great many woods in Algeria, and every year new fires are lit with the same object. Those considerations have determined the sportsman just mentioned to have recourse to new instruments of hunting. As a means of destruction corresponding to his views, M. Constant Chéret has invented what he calls the *silocage*, and of which the following is a short description: The frame and bars are of iron. It is about ten feet long, two feet six inches wide, and the same in height. Mounted on three cast-iron wheels of small diameter, it can be moved even on difficult ground. The upper part opens with folding doors, like a wardrobe, and they close of themselves at the slightest shock given to springs of steel. Catches retain the lids as they fall, and imprison the animal as soon as he touches the bottom of the trap. The plan is to place this trap, properly baited, on the ground frequented by the wild animals, and then, when the game is caught, to wheel the machine away to some menagerie prepared for the purpose.

Sea and River Fishing.

FISH IN SEASON IN SEPTEMBER.

COAST FISH.	LAKES.
Bluefish, Skipjack, Horse Mackerel. (<i>Temnodon saltator</i> .)	Black Bass, (<i>Micropertus nigricans</i> and <i>archigan</i> .) (two species.)
Spanish Mackerel, (<i>Cero maculatum</i> .)	Maskinonge, (<i>Esox estor</i> and <i>nobilior</i> .) (two species.)
Weakfish, Squetang (Trout) <i>Otolithus</i> .	Pickarel, (<i>Esox reticulatus</i> .)
Sheepshead, (<i>Sargus ovis</i> .)	Pike perch, <i>Lucioperca Americana</i> .)
BAYS AND ESTUARIES.	
Striped Bass, Rockfish, (<i>Labrax len-</i>	Land-locked Salmon, (<i>Salmo Gloveri</i> <i>eatus</i> .)

—The Fish Commissioners of Pennsylvania have placed one thousand black bass in the North Branch of the Susquehanna and the Lehigh river, and care has been taken to give them a fair chance for propagation. In the dam at Williamsport one hundred of the same kind of fish have been planted, and in a short time most of the waters of the State suitable for raising bass will be stocked with this excellent game fish. Two million and three-quarters of shad were hatched at Newport, on the Juniata during the month of July, and the process is still continued. The rearing of trout and salmon has been a decided success, and scaly plants of this kind will soon be introduced into all the waters of the State adapted for their growth. A fish way for shad will soon be located in the dam upon the Susquehanna river at Columbia, and others ordered by the Legislature will be constructed as soon as practicable.

—The sport of catching weak fish and king fish in Jamaica Bay has been sadly impaired this season by the netters who sweep away at every tide thousands of fine fish.

—The upper waters of Northern New Brunswick rivers are now so low as to be impracticable for birch canoes.

—The following valuable information respecting the fish of the Western waters, including the great lakes and the Mississippi, has been given to us by an old veteran, and we doubt not will prove as new to most of our Eastern readers, as the latest sensation novel. He says:—

“The fish we call pike is the same fish that is called maskelonge. I saw one at Cleveland that would weigh about thirty pounds. They called it a maskelonge, and I could see no difference in it from our pike. The largest one I have seen taken weighed thirty-two pounds, and was caught in lake Conneaut. He was taken by Mr. Gormby; his head was sent to Philadelphia and exposed in a shop window for the natives to gaze at. The largest I have taken weighed twenty-eight pounds, and I have taken two of that weight, and quite a number that would weigh over twenty pounds. They abound in the Mississippi, and weigh from three pounds up to forty pounds, and are the same fish that we take in the Ohio. I saw the head of a pike nailed on a barrel at Lowell, on the Muskingum river, Ohio. The merchant at whose door I saw it told me he had weighed it himself and it weighed forty-three pounds. We have taken a great number of pike in the Muskingum that weighed from fifteen to twenty-six pounds.

White salmon weigh from twelve to eighteen pounds. These fish are the same that are called wall eyed pike on the great lakes, from lake Ontario to lake Superior. I have seen three or four of them in the latter lake when fishing for speckled trout. Lake Huron I am told has great numbers of them in it, and numbers of large salmon are brought to the Pittsburgh market from lake Huron, and are the same fish that is in the Ohio.

Prof. Agassiz in classifying the fish of the Western rivers, calls them the salmon of the Ohio, and I think he ought to have placed them at the head of the perch family, as they are neither pike or salmon. The black or jack salmon, as we call them, are in all the great lakes, also in the Ohio and Mississippi rivers, and weigh from half a pound to three pounds. The lake people call them sand pike. They are spotted like a rattlesnake.

The bass in the Ohio, Mississippi, and lakes are the same fish. The small lakes in the West have the Oswego bass, but they are not considered as good a fish for the table as the black bass. Have never seen a bass exceed five pounds weight.

The buffalo is a different fish from the red horse. The fish that I have heard called red horse is a large red-finned sucker, the largest will weigh six pounds. The buffalo of the Mississippi river, is a large heavy-shouldered fish; with large scales of a bluish color, and sucker mouth, weighs from five to twelve pounds.

The bait we use for pike is chubs, or small suckers, eight or ten inches in length, but any small fish will do.

I have had good sport trout fishing in Wisconsin and Minnesota. The trout were from a pound to four ounces in weight. Some streams were covered with timber, others were on the open prairie, lined with black alder, and so dense as to exclude the sun's rays, and cut into the soil about six feet deep, and the angler had to hunt places here and there, and poke in his rod wherever he had space to make a jerk to hook the fish. There are no mosquitoes or gnats to trouble you on these streams. The fishing is pleasant, and it was my good fortune to find pleasant houses to stop at where there were no bugs, and the lady of the house knew how to cook the trout. I have had some fine fishing in the Mississippi. I have a son who resides at Dubuque, Iowa, and we pay them a visit each spring in April. Pike, black bass, and white salmon are quite plenty. We stay with them five or six weeks, and then go up the Mississippi river to the neighborhood of lake Pepin. The Chippewa river empties its clear water into the Mississippi river one mile below the foot of lake Pepin. All its branches are trout streams, and its water is much cooler than the Mississippi. It is a great lumber stream, and a great many rafts descend it to the Mississippi, and to the cities below. These rafts are strung along the shore for several miles, and the cool Chippewa water passes under them, and the white salmon collect in vast numbers under the rafts where they are sheltered from the sun, and enjoy the cool water of the Chippewa. The minnows pass up the river in vast numbers just along side of the rafts, and the fisherman has a scoop net with a handle nine feet in length, and he makes a drive at the minnows down the stream, and an expert will sometimes take a quart of minnows at one drive; enough to do a party for a day's fishing. You fish for salmon close along side the rafts, where they lie when they want to catch

the minnows. It is about as pleasant a place to fish at as I ever visited, the rafts are so clean and such an extreme range of them to fish off from. The town called Reed's Landing on the opposite side of the river, in Minnesota, is a pleasant village of one street, and all the houses front the river.

The house that I stopped at is kept by Lorenzo Dow Bullard. The best fishing lies opposite to his house, and I used to leave his house at eight o'clock in the morning and fish until he sounded the gong for dinner, by which time I would have taken from twenty to fifty white salmon, weighing from two to six pounds each, or, in other words, as many as two persons could carry on a pole up to the hotel, where they were distributed among the citizens, so that none were lost or wasted, as I never catch more fish than can be used or given away.

I was up at Marquette last summer. The large brook trout are all caught out of the lake, within fifty miles of that place. We caught a few, but not worth talking about, in comparison to what they used to be.

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

DATE.	BOSTON.	NEW YORK.	CHARLSTON.
	h. m.	h. m.	h. m.
Sept. 25.....	1 19	10 40	9 58
Sept. 26.....	1 58	11 22	10 40

Sept. 28.....	3 38	0 14	noon
Sept. 29.....	4 25	1 12	0 25
Sept. 30.....	5 32	2 18	1 32
Oct. 31.....	6 42	3 29	2 43

—The New York Yacht Squadron will hold their autumn regatta on October 2d. It promises to be a great success as the number of prizes and purses offered for all classes is unusually large. The ocean races for the Commodore's gifts will be sailed one week later—October 9th. The regatta proper will be sailed over the usual regulation course, subject to the time allowances, and under the sailing regulations of the squadron. No entrance money will be required. All yachts must carry their private signals at the main peak. The start will be a flying one, and the time of each yacht will be taken as she crosses a line between a stakeboat, which will be anchored in the Narrows, near Fort Wadsworth, Staten Island, and the judge's steamer. The signals for starting will be given from the Judge's boat as follows: For a preparatory signal, one gun and lowering the yacht club flag on the steamboat, and ten minutes later, for the start, one gun, and the flag will again be lowered. No yacht's time will be taken later than fifteen minutes after the second gun, unless instructions to the contrary are given by the judges on the morning of the regatta. The course will be from the starting-point, as above, to and around a stakeboat, at buoy 8½, on the Southwest Spit, keeping it on the port hand in turning, thence to and around the Sandy Hook Lightship, keeping it on the starboard hand in rounding, and return over the same course, keeping the Southwest Spit buoy on the starboard hand. Yachts must keep to the eastward of buoys Nos. 9, 11 and 13 on the west bank, going and returning, and will pass between the judge's boat and the stakeboat on arriving home.

The ocean course will be from an anchorage off Owl's Head, New York Harbor, to and around the Lightship on Five Flathorn, off Cape May, N. J., and return to Sandy Hook Lightship.

Three purses of the value of \$1,000, \$250 and \$250 respectively, also presented by the Commodore, to be sailed for over the same course upon the same day, and open to the following classes of vessels hailing from any port in the United States:

First—Pilot boats.

Second—Working schooners of not less than 25 nor over 300 tons, old measurement.

Third—Schooner smacks.

In this race the first vessel arriving at the winning post will take the purse of \$1,000, the first vessel arriving of each of the other two classes to take a purse of \$250; no class, however, to win more than one prize.

All of the above races will be sailed under the rules and regulations of the New York Yacht Squadron.

—The two racing yachts—Mr. Fleet's W. T. Lee, and Mr. Ira Smith's Brooklyn—both of the Brooklyn Yacht Club, have made a match for \$500 a side, to sail from Gowanus Creek ten miles to windward and return. A steamboat will accompany the yachts. This race will be sailed on the 29th September.

—The sloop yacht Psyche, owned by Mr. Dickinson, went ashore on the west bar of Rockaway inlet, and has gone to pieces, being previously stripped of her valuable spar.

—The match between the sloop yachts Meta, Mr. George A. Beling, and Vision, Mr. J. Alexandre, for a cup valued at \$1,000, has been set down for the second week in October. The race will be twenty miles to windward and return, from the point of Sandy Hook.

—The schooner Tidal Wave and sloop Addie V., N. Y. Y. C., have gone out of commission. The owners are going to Europe.

—Mr. David Kirby, of Rye, is building a sloop yacht for Mr. Daniel Edgar, of New Rochelle. She will be 70 feet on deck, 20 feet beam, and 5 feet 6 inches hold. Her frame is nearly up, but the boat will not be completed until next year.

—It is more than probable that the celebrated schooner Madeleine, N. Y. Y. C., Mr. Jacob Voorhies, Jr., will enter for the club race on the 2d prox., as well as for the ocean race on the 9th of October.

—The Harlem Yacht Club sent out invitations to their friends, to participate in a Rhode Island clam bake last

week, on their grounds at Port Jervis. Great good humor and feeling prevailed throughout, and part of the afternoon the ladies indulged in their favorite pastime. The event of the day was the club yacht race between the well-known yachts Quits, Josie J., Mary Campbell, Emma Sophia, and Mary Emma, from a stakeboat located off the club house, around a buoy near the shore at Riker's Island, and repeat, and was won after a hard struggle by the Emma Sophia, the Quits being second.

—The Halifax Royal Yacht Club race for the \$100 cup, to and around Sambro Island light, took place September 19th. Three yachts contested—the Whisper, Petrel, and Squirrel, and started at eight A. M. The distance sailed was about forty miles. The race was won by the Whisper, which came in fifteen minutes ahead of the Petrel, and forty-five minutes ahead of the Squirrel.

—Harlem Rowing Club vs. Nassau Club—single scull. This interesting single race between these two prominent clubs, took place on the Harlem river, September 20th. The course was from Morris Dock to the Powder Boat, three miles straight away. They started at half-past five. The tide was just at the flood. Both of the men took the water together, and rowed abeam for about 300 yards, when the Nassau scull (C. Myers) showed a slight lead. The Harlem scull (T. R. Keator) was keeping close to the shore, and at last ran aground, which gave his opponent the lead by ten lengths. Keator, having lost a few seconds, now put on all his extra steam, but could not overtake his antagonist, C. Myers, who eventually came in a winner by ten boats' length. Time: 22 minutes 30 seconds. T. R. Keator won the single scull prize at Saratoga, and if it had not been for his unaccountable mishap, it is probable the race would have been more closely contested.

—The Atlantic Boat Club of Hoboken, held their annual regatta on the 17th, on the Passaic river, above Newark, N. J. The junior and senior championship medals were contested for. For the junior championship there were three entries, viz: Althen C. Kiel, Dixon McQueen, and George Vail. The course was one mile and a half and return. The men pulled in seventeen foot boats, and Kiel, who had the advance from the start, came in an easy winner in 24:54.

There were four entries in the senior race over the same course in single scull shells, viz.: Andrew Dupicare, Robert L. Lefman, P. C. Ackerman, and John A. Ackerman. The race was not exciting, and Lefman won easily in 23:15. The prizes were two gold championship medals, which will remain the property of the winners.

—There is a talk of getting up a match between William Stevens, of Poughkeepsie, and John Biglin, for a purse of \$1,000, the race to take place at Poughkeepsie.

—The L'Hirondelle Club of Baltimore, have just received a new four-oared shell boat, which will be entered in the coming regatta.

—Yale College students held a meeting last week, at which great interest was manifested in boating matters. We expect great deeds from the students this fall.

—The Nassau Boat Club of this city has a crew in training for a four-oared shell race, to be rowed on the Potomac river, with the Aahnostan Boat Club, of Washington, October 2d.

—The Nassau Boat Club has challenged the Atlantas to a four-oared shell race, to take place on the Harlem river, about October 15.

—The Argonauta Rowing Association, of Bergen Point, N. J., and the Neptune Association, of Brighton, S. I., have decided to row their annual four-oared shell race, for the championship of the Kill-von-Kull, October 15th.

—The Maine Boating Association will hold their annual regatta on the Kennebec river, Bath, Me. There will be four races—four oars, for championship and colors of the State; double scull, and senior scull, all three miles, with a turn, and the junior shell race, two miles, one turn.

—The Ridgefield Rowing Association will hold their annual regatta on September 27th.

—The President of the Celtic Rowing Club of Buffalo, has kindly furnished the following information by request:

There are at present, in Buffalo, eight rowing clubs, viz: "Hibernias," "Buffalos," "Celtics," "222s," "Black Rocks," "Niagara Rivers," and "Scajaguadas." The Hibernias consist of 75 members, and have at present three four-oared shells. They were organized six years ago, under the name of the "Banshees," and reorganized in July of this year, under their present name, with the following officers: Lyons, President; Alex. Bennett, Vice-President; Jas. Noonan, Secretary; J. Donovan, Treasurer; T. O'Grady, Coxswain. The first crew of this club, (Banshees,) are considered one of the best in western New York, but have been unfortunate of late years. The "Buffalos" were organized about five years ago, and in members are somewhat stronger than the Hibernias. They have three four-oared shells, six single scull shells, and one eight-oared gunwale barge. This club defeated the Banshees this summer, and leave this P. M. to pull the Riversides of Rochester. The "222s" were organized five years ago, and count up fifty members; they have two four-oared shells and one single scull shell. The Live Oaks were organized the same time, and are about the same in members; they are the possessors of three four-oared shells. The Black Rocks were organized in July 1871, and are a very strong club; they have two four-oared shells. The Celtics were organized on the 19th of July, 1872, and consist of 65 members; they are the owners of two four-oared shells, and are about sending an order for a four-oared and a single scull shell. The Niagara Rivers were organized in June of this year, and the Scajaguadas in August; each possesses one four-oared shell. There are five or six yachts here, but little or no interest taken in them. As to regattas, there is poor prospect of having one here this Fall. The Black Rock Rowing Club speak of getting up one this month—but I am afraid it will be a failure. The Hibernias have decided to issue a challenge, (at their next meeting,) to any or all clubs in Buffalo or Toronto; if this proves true, there

will be rare sport here this Fall. There has been no change in the officers of the fleet or of any club with the exception of the Celtics, who elected the following named persons to fill the vacancies, viz: Thos. Cavanaugh, Treasurer; Jerry Neihan, Chas. Kennell, Thos. Casey, Directors.

—The entries to the National Amateur Regatta, which takes place at Philadelphia October 7th, are unusually large, and an immense number of the friends of the amateur rowers are expected to be present. The Philadelphians are doing all in their power to make this regatta a great success, and judging from the list of entries, we should say it is a foregone conclusion.

In the four-oared race are the Undines, and three other Philadelphia clubs. From New York, are the Argonautas, Mutuels, Beaverwycks, Nassaus, Harlems, and the Analostans. In the double scull race there are five or six entries. In the single scull race there are six from New York, two from Philadelphia, two from Albany, one from Union Springs, one from Grand Haven, Mich., one each from Baltimore, Rochester, and Washington. If these fifteen entries all come to the starting point, and race without a foul, it will remain on record as one of the greatest feats of the success of amateur oarsmen that the world has ever witnessed.

—The senior Yale College shell crew have been chosen, and are already in training for the fall regatta. The following compose the crew: Messrs. Green, Dunning, Waterman, Bristol, Henderson, and Monroe.

CORNELL UNIVERSITY,
ITHACA, September 20th, 1873.

EDITOR FOREST AND STREAM:—

Athletic sports at Cornell University have been, until lately, without firm footing, and accordingly have struggled to keep alive during the opening years of the University. But at the present time everything, except base-ball, is progressing finely.

Last year the officers of the "Navy" succeeded in clearing the organization entirely from debt, leaving it to start the present season financially unembarrassed.

The clubs and individuals composing the "Navy" own the following boat property: Five six-oared shells, two six-oared lapstreaks, one eight-oared barge, one single lapstreak, three single shells; twelve (12) boats in all.

There are at present belonging to the different clubs, two silver goblets, to be rowed for annually by the various clubs. These cups are for six-oared shell crews.

The "Navy" directors design to enlarge the boat-house this year, and some new boats secure prizes for single sculls, and encourage competition in all manner of athletics. They will also have a gymnasium, organized and in running order in a short time, unless the university authorities anticipate them, by building for the purpose, which they (the authorities) have not been able to do up to the present time. Foot-ball is now in full blast, and a number of matches are ticketed for the next few weeks.

The committee of the B. B. Club were able to secure suitable grounds for playing upon near the close of last year, but too late for use at that time, so that soon, in all probability, our nines will have a chance to do themselves full justice in the ball field.

Our men, as a rule, have very little time to engage in athletic sports, but what time they have they make the most of, and we trust that the time may not be far distant when Cornell can show athletes accomplished, not only mentally, but physically. J.

[From our own Reporter.]

—High winds prevented the St. John International Regatta from taking place on the day advertised, although upwards of 20,000 people had assembled to witness the races. The next morning, September 18th, the weather was clear and crisp, and scarcely any wind was felt. The water was delightfully smooth, and scarcely a ripple disturbed its surface. At seven o'clock, between four and five thousand people were on the grounds, and every half hour trains, filled with eager, excited crowds, came up to the station at Riverside. The Alida, the judge's boat, came up a few minutes after seven. The McLarens, with their fine boat, were on the water, rowing about, shortly before the Alida hove in sight, and in a few minutes after, the Paris crew glided out from Johnson's, amid cheers from the spectators. They were followed by the Indiantown crew, and finally the Longshoremen, of Portland, bore down the river. The Paris crew took their places first, the McLarens next, then the Longshoremen, and the Indiantown oarsmen last.

The men in the competing boats were as follows:—

Paris crew—Robert Fulton, stroke; Samuel Hutton, aft midship; Elijah Ross, forward midship; George Price, bow; Carleton, St. John.

McLaren crew—Robert, James, George, and William McLaren, Carleton, St. John.

Longshore crew—J. Conwell, stroke; M. E. O'Brien, aft midship; M. O'Brien, forward, midship; T. Twig, bow; Portland, Me.

Indiantown crew—Ralph McCormack, Dimmock Davis, George Reynolds, George Day; Indiantown.

The boats being now in position, the start was made at twenty-one minutes past eight, by a gun fired by one of the starters. The Paris crew went off quite steadily, Price steering. The McLarens got away well, the Longshoremen, with admirable rapidity, rowed with a quick, light stroke, and the Indiantown crew were behind the others from the start. The McLarens, with a tremendous stroke of 45 to the minute, at the first mile and a half had secured a lead, and the Portland, Me., crew were close behind them; the Paris crew were third, and the Indiantown men still bringing up the rear. On turning the buoy, Hutton's oar just tipped it, and the Paris crew was ahead, followed closely by the McLarens and the Longshoremen. The row-

ing by these three leading crews has rarely been surpassed on any waters, by any oarsmen. The great Paris crew pulled with a brilliant, sprightly stroke, keeping its hot contestants closely in the rear. The most intense excitement prevailed among the enraptured spectators. Steadily the Portland crew gained, inch by inch, on the formidable four, and as steadily did the veterans keep ahead. The Longshoremen proved to be foemen worthy of their steel, and perhaps were the most difficult men to beat that ever engaged the champions. This fine crew presented a fine spectacle, as they passed the McLarens, their lithe oars gleaming like shafts of silver, as they struck the water, and sparkled in the sunlight. Every eye was riveted now on these two boats. The greatest excitement was felt, and anxiety was pictured upon every countenance, as the two boats came up, swinging to the goal almost neck and neck. Once the Longshoremen were lapped over the St. John boat, when within a few yards of the goal, but the latter made one of their dashing manœuvres, so familiar to these same worked-up spectators, and the race was won. Over the line went the boat, three-quarters of a length ahead of the men who had worked with such vigor and spirit, and proved themselves such formidable rivals. The McLarens made a good third, and the Indiantown men came in fourth. The time made was 39 minutes 34½ seconds and the course was six miles.

The single scull race followed after the Inrigger's four-oared race. This latter was won by the Logan crew, in the "Crown Prince;" colors, pink, and second money was taken by the Harned crew.

The event of the day was now called, and five excellent oarsmen took their stations. This was the famous single scull race. Brayley came up first, Fulton and Biglin next, Lovett followed, and Doyle rowed up soon after. The gun started the race at twenty-five minutes past eleven. Biglin had the outside, and Fulton the inside positions, the others were in the middle. All hit the water rapidly and with promptness. Bayley, who is only twenty-two years of age, to the surprise and admiration of every one, took the lead, and rowed with fine effect, eliciting wild cheers and applause from the multitude on the shore. Fulton rowed a long, sweeping stroke, and Biglin had a quick, effective stroke. Half way to the winning point, Fulton and Biglin swept past Brayley, and rowed hard, but without avail, to get away from him. Slowly, but with unerring precision, the two great oarsmen crept upon the plucky youth, and finally passed him, though on he kept, working with a will and "gamely," though two boat lengths behind. At this turn of affairs, the people, seeing Brayley's chances of recovering his lost position of no avail, centered their undivided attention upon the two more renowned oarsmen. Now Fulton was ahead, battling in his own peculiar way, and beating the water with his oars; then Biglin came to the front, taking the lead with apparent ease. All along the shore the crowds ran, shouting and cheering to their favorites, as each seemed to gain a temporary advantage. At length Biglin appeared to realize the danger of his position, and with a bold spurt made an effort to cross the line first. Fulton was, however, too much for America's great sculler. His extraordinary powers of endurance were not exhausted, or tired, as he was nerved up for the task, and with an almost superhuman effort, made one of his magnificent spurts, and crossed the line the winner, by about four feet. Brayley followed closely on the heels of Biglin, who came in second. Lovett was fourth, and Doyle brought up the rear, but very creditably. After the race, both Fulton and Biglin rowed up to the judge's boat, and received the announcement that Fulton had won the race in 27 minutes 42 seconds, by a quarter of a boat's length ahead. Biglin disagreed with the judges, and said that he had won. It was, however, submitted to the umpire, Hon. T. R. Jones, who ruled that the race was won by Fulton. No man seemed more surprised at the result than Fulton himself. The rowing of both oarsmen was most admirable, and praiseworthy. Brayley acquitted himself excellently, and is looked upon as the rising oarsman of St. John. His boat had much water in it at the termination of the race. Biglin's friends were very much incensed that their favorite should have lost, and the result of the coming contest in Halifax, between Brown and Biglin, excites much comment. Brown stock has gone up considerably since the race of today.

After the scull race, the pair-oared race was called; six boats competed. The McCormacks, in the "Brothers' Pride," were the winners. Time: 25:50.

The scrub race was next in order, and was won easily by the "Flying Light." The single scull race for New Brunswick then took place, and was won handsomely by Brayley, in 28:17. Fulton had entered for this race, but did not run. The tub race was won by David O'Neill, in the tub "Tingilary man." This race provoked considerable laughter and amusement among the spectators.

The regatta closed at about half-past two o'clock. The gentlemen in charge did their utmost to have everything conducted on the fairest and most honorable principles, and were eminently successful in carrying out their intentions. Mr. D. G. Smith, the indefatigable secretary did by far the greater portion of the making up of the regatta, and was mainly instrumental in bringing it to a proper conclusion. His arrangements for the accommodation of the representatives of the press, on board the judge's boat, were most complete and satisfactory.

In the evening, bonfires blazed in every quarter of the city, torch-light processions and bands of music paraded the streets, and the oarsmen were feasted and lionized by the populace. Good order was in every instance maintained.

The Horse and the Course.

SACRAMENTO, Cal., September 18.—On the second day of the Trotting Fair the attendance of spectators was immense, and far exceeded the expectations of the association. The great event of the day was the contest for a plate prize, valued at \$2,000, offered to any horse beating the fastest time made in California, which was 2:17½, made by Goldsmith Maid. Governor Stanford's horse Occident was entered for the plate prize, which he won in the first heat, making the mile in 2:16½. The excitement on the announcement of the extraordinary time made was intense. Ever since Occident's defeat by Goldsmith Maid he has been in charge of a new trainer and driver. After Occident making the extraordinary time yesterday of 2:16½, Governor Stanford's friends here prevailed on him to make another trial. Occident was brought upon the track amid the wildest enthusiasm. On the second trial Occident made a bad break. He accomplished the second heat in 2:18½. O. D. Hickok, the driver of Lucy, and several other Eastern horsemen were present, and watched both heats. The time cannot be disputed.

BANGOR, Maine, September 18, 1873.—There was a very large attendance in all the departments of the State Fair. The trotting was witnessed by the largest audience thus far present. The race for 2:48 horses was won by Palmer Knox. The race for four year olds was won by Princess. The purse for 2:35 horses was won by Phil. Sheridan.

WAVERLEY, N. J., September 19.—The races at Waverley on the 19th were better attended and more spirited than on any other day of the season. The racing began at half past one o'clock, the first on the programme being for gentlemen's pairs, for \$150, owned in the State. There were six entries, but only three started. At the third trial they got an excellent start. Listener and mate won in 2:55½, 3:05½, 2:48½. The second race was for \$375, for horses that had never beaten 2:30. There were nine entries. The third heat was marked by sharp jockeyism. The driver of Susie Clay, J. H. Phillips, had won second money, and on the last quarter he deliberately pulled back out of the position, and struck Lady Shaw a sharp blow with his whip. She broke, and Waverley passed her, coming in ahead for third money. The best time of the race was made in this heat, Lady Emma crossing the line in 2:39. The day's races closed with a race for road pairs, owned in the State, for which there were six entries, and a four-year-old race for a purse of \$150, for which there were six entries. They were both spirited trots. The race of pairs, which was a half mile dash, was won by Listener and mate easily in 1:25½. In the four-year old race, the b. m. Trenton, owned by D. S. Quinton, was also an easy winner in 2:44, 2:52½, and 2:55.

FLEETWOOD PARK, September 18.—The second day's trot on Fleetwood course was largely attended. The first race was for horses that had never beaten 2:35. There were thirteen entries; eight came to the score. Mollie Smith won after a splendid struggle with Tommy; time, 2:35½. The race for horses that had never beaten 2:24 was the great event of the day. There were five entries. Crown Prince won by a head. Time, 2:25½.

SEPTEMBER 22.—Purse of \$1,200, for horses that had never beaten 2:31. Mile heats, best three in five, in harness. Fleety Goldust won in three straight heats. Time, 2:31, 2:34½, 2:31½. The last race was for a purse of \$2,500, for horses that had never beaten 2:21. Mile heats, best three in five, in harness. Judge Fullerton won in three straight heats. Time, 2:27½, 2:25, 2:25½.

A SAGACIOUS HORSE.

The Bangor (Me.) *Whig* tells the following story, illustrating the sagacity of a horse owned in that State: "Captain Frank Lane, who lives on an island near Vinalhaven, has a span of horses. A few weeks since, during the absence of Mr. Lane, one of the horses backed into a well about twelve feet deep. His mate immediately started for the house of a neighbor, and by neighing and other ways endeavored to attract the attention of the inmates. Gaining their attention he ran back to the well, and evidently tried to induce them to follow him. After repeating this several times, the neighbors became satisfied that something unusual had taken place, followed the horse to the well, and after a little delay gathered a force and rescued his mate from his uncomfortable position. To their astonishment the horse had received no injuries worth mentioning. Upon his return, Mr. Lane had occasion to go down after passengers, and concluded to harness the horse which met with no accident, into a single wagon, and give the other horse an opportunity to recover from his bruises. No sooner had he started, than the horse's mate placed himself by his side, and kept his place down and back, and this was repeated several times when Mr. Lane concluded to again harness them both and let them in future work 'together in double harness.'"

A correspondent of the *Western Rural* gives this cure for ring-bone: "Pulverized cantharides, oil of spike, oil of origanum, oil of amber, oil cedar, Barbadoes tar, British oil, each two ounces; oil of wormwood, one ounce; spirits turpentine, four ounces; common potash, one-half ounce; nitric acid, six ounces; oil of vitriol, four ounces; lard, three pounds. Melt the lard and slowly add the acids; stir well and add the other ingredients, stirring until cold. Clip off the hair and apply by rubbing and heating into the parts affected. In about three days, or when the part is done running, wash off with suds made with white Castile soap and apply again. In old cases it may take three or four weeks, and in recent cases two or three applications have cured. The remedy has cured cases of long standing."

Is a game eye essential to a hunter?

—When Horace Greeley visited Yosemite he picked up in the trail a horse shoe, and hung it on a knot of an oak tree for whoever might choose to use it. No one took it, and in time the knot grew over the horse-shoe, and recently the portion of the tree containing it was brought to San Francisco as a memento of Mr. Greeley's economy.

—"Chan. Reticker," at the Greenland race course in Kentucky, has performed the feat of riding fifty miles in two and a half hours. Horses were changed on each mile. The total running time was 1 hour, 52 minutes, and 31½ seconds. The time lost in changing horses was 12 minutes and 48½ seconds. Ten different horses were used.

Military News.

THE United States army comprises an Engineer battalion of five companies, ten regiments of cavalry, five regiments of artillery, and twenty-five regiments of infantry. The cavalry numbers officers and men, 10,562, the artillery 4,080; the Engineer battalion, 532; the infantry, 16,000; these with 935 General and Staff officers, and 400 unattached officers and men, including 300 at the Military Academy, makes the aggregate of the army 32,554. General Sherman commands the army and ranks full general, which rank was created by Congress for General Grant and was continued in the instance of the present Commander. This rank, however, will be vacated with General Sherman, and was only created by Congress to these two officers for their great service to the country. The next in rank is Lieutenant General Sheridan, commanding Division of Missouri, headquarters Chicago, Ill., and the Major-Generals of the army comprise General Hancock, commanding Division of Atlantic, headquarters New York city, General Schofield, commanding Division of the Pacific, headquarters at San Francisco, Cal., and General McDowell, commanding Division of the South, headquarters Louisville, Ky. There are now six commanding Brigadier-Generals, the number having been decreased, one by the assassination of Brigadier-General Canby in the Modoc War. These comprise Brigadier-Generals Philip St. George Cooke, John Pope, Oliver Howard, Alfred H. Terry, Edward O. C. Ord and Christopher C. Auger. All of these officers, with the exception of General Howard, are in command of military departments of the above named divisions, General Howard is on the "peace" path against the Indians. The four military divisions of the army are divided into eleven departments as follows: The Military Division of the Missouri, comprising Department of Dakota, Brigadier-General Terry commanding, includes the State of Minnesota and the territories of Dakota and Montana, headquarters St. Paul's, Minn.; Department of Missouri, Brigadier-General Pope commanding, includes the States of Missouri, Kansas, and Illinois; territories of Colorado and New Mexico and Camp Supply, Indian territory, Department Headquarters, Fort Leavenworth, Kansas; Department of the Platte, Brigadier-General Ord commanding, includes the State of Iowa and Nebraska, territories of Utah and Wyoming; Headquarters Omaha, Neb.; Department of Texas, Brigadier-General Auger commanding, includes State of Texas and the Indian territory, excepting Camp Supply; Department Headquarters, San Antonio, Texas. The Division of the Atlantic comprises, Departments of the East, and of the Lakes. The Department of the East, includes the New England States and the States of New York (except the Northern frontier, west of Ogdensburg), New Jersey, Pennsylvania, Delaware, Maryland, Virginia, West Virginia and the District of Columbia, with Department Headquarters, like those of the Division in New York city, Major-General McDowell commanding. The Department of the Lakes, Brigadier-General P. St. George Cooke commanding, includes the States of Ohio, Michigan, Wisconsin and Indiana and the Northern frontier, as far east as Ogdensburg, New York; Department Headquarters, Detroit, Mich. The Military Division of the Pacific comprises Departments of California and Arizona. The Department of California includes the State of Nevada, the post of Fort Hall, Idaho territory, and so much of California as lies north of a line from the northwest corner of Arizona territory to Point Conception, Cal., Department Headquarters, San Francisco, Cal., under command of Major-General Schofield. The Department of Arizona includes the territory of Arizona and so much of California as lies south of a line from the northwest corner of Arizona to Point Conception, Cal.; Department Headquarters Prescott, A. T., Lieutenant Colonel George Crooke, of the 23d Infantry, in command. The Military Division of the South was abolished with the death of General Thomas, but was afterwards re-established. It comprises the Departments of the South and Gulf. The Department of the South includes the States of North Carolina, South Carolina, Georgia, Alabama, (including the post in Mobile Bay,) Florida, (except the Gulf post from Pensacola harbor to Fort Jefferson and Key West inclusive,) Tennessee and Kentucky. Major-General McDowell is in command, headquarters at Louisville, Ky. The Department of the Gulf is in command of Colonel W. H. Emory, of the 19th Infantry, headquarters New Orleans, La., and includes the States of Louisiana, Arkansas, Mississippi and the Gulf Ports as far eastward as and embracing Fort Jefferson and Key West, Fla., excluding the post in the Mobile Bay.

The pay and emoluments of army officers, in the active service, varies somewhat according to the arm of the service. Prior to five years service it is annually as follows:—General, \$13,500; Lieutenant-General, \$11,000; Major-General, \$7,500; Brigadier-General, \$5,500; Colonel, \$3,500; Lieutenant-Colonel, \$3,000; Major, \$2,500; Captain, mounted, \$2,000; Captain, not mounted, \$1,800; Regimental Adjutant, \$1,800; Regimental Quartermaster, \$1,800; First

Lieutenant, mounted, \$1,600; First Lieutenant, not mounted, \$1,500; Second Lieutenant, mounted, \$1,500; Second Lieutenant, not mounted, \$1,400; Chaplain, \$1,500. With the exception of the first four grades, after five years service, 10 per cent. is added to the monthly pay, 20 per cent. after fifteen year's service, 30 per cent. after fifteen year's, and 40 per cent. after twenty year's service. The pay of the retired list among the higher grades varies from \$2,000 to \$500 less, commencing with the Major General who receives \$5,625. Officers of lower grades on the retired list, receive from \$400 to \$200 less than the active list.

—In consequence of the yellow fever at Shreveport, La., Dry Tortugas, and other portions of the South, the government has forbidden officers North on leave, or otherwise absent, from stations affected by epidemic disease or from stations that cannot be reached without transit through infected localities, to return until they receive information to the effect that all danger is past. We trust all officers of the army on leave will have received this wise information in time. Still we learn two officers of the First Artillery previous to the issue of this order had started to return. Captain Langden returned last week to head-quarters, and Lieutenant Ingalls was telegraphically ordered to his station, Dry Tortugas by the Gulf Commander, before his leave had expired. It is almost sure death for any person coming from the North, to proceed to any portion of the South affected with this disease. There have been a few deaths among the officers and men stationed at the localities affected, but we trust as the epidemic is now somewhat subsiding, there will be no more deaths. The First Artillery, on the 13th inst. lost First Lieutenant, Jas. E. Bell, one of its most faithful officers, by this fell disease. This officer, since August, had been alone in command of that uninviting post Dry Tortugas, and when the yellow fever broke out in the garrison he worked like a true soldier in looking after his command, and sending those not affected with the malady, to a safe retreat. He alone, as the only commissioned officer at the post, stayed at his post, and looked after the sick, until relieved by a fellow officer. The relief, unfortunately, came too late to save this noble officer, for he died on the above date, the exposure and exhaustive care of the sick, having been too great for him. Lieutenant Commander A. N. Mitchell, in command of the *Pawnee*, also died of yellow fever, at Key West, Sept. 14.

—Major W. W. Burns, of the Subsistence Department, has been ordered from New York to San Francisco, Cal. having been relieved by Major M. R. Morgan.

—General Rufus Ingalls, Assistant-Quartermaster-General U. S. A., has left Vienna and its exposition confusions for the tumultuous excitements of the French capital. He is on a Government Military Commission and the powers that be, at Washington, exercised excellent judgment when they sent abroad so capable an officer to use his eyes and faculties for his country's good.

—The name of the Commissary-General of Subsistence, Brigadier-General Eaton, is peculiarly suggestive of his duties. Yet, we do not presume, this had anything to do with his appointment; in fact we feel assured so important a position was secured only by hard fighting, like most merited promotions.

—The Engineer Corps of the Army has one Chief of Engineers; Brigadier-General Humphreys, six Colonels, twelve Lieutenant-Colonels, twenty-four Majors, thirty Captains, twenty-six First Lieutenants and four Second Lieutenants. The Corps of Engineers is one of the most important branches of the service, and its officers are constantly showing their work. The names of Humphreys, Barnard, Cullen, Benham, Macomb, Tower, Wright, Newton, Gilmore, Abbot and others are as household words to the country, and the importance of their undertakings cannot be over-estimated.

—One hundred and fifty recruits have been ordered to the head-quarters Omaha, Neb., Fourth Infantry, in the Department of the Platte, and one hundred and twenty for the Fifth Cavalry, head-quarters Benecia Barracks, California.

—Extensive changes have been made in the location of the officers of the Subsistence Department.

—Companies A and I, Fourth Cavalry, have been changed from Fort D. A. Russell W. T., to Fort Fetterman W. T., company H., from Omaha Barracks, Neb., to Camp Douglas U. T. & Company K., from Omaha Barracks, to Fort Bridger. Companies B. C. I. T., Eighth Infantry have been changed from Omaha, Neb., to Fort D. A. Russell W. T., and Company H., from the same post to Fort Ned Steele W. T. Companies E. & F., Thirteenth Infantry, have changed from Fort Fetterman, to Fort Sanders W. T.

—The regimental prize for excellence in marksmanship for the year 1873, in the Second Cavalry has been awarded to private Irving Carpenter, he having made the best string at target practice during the year.

—The troops of the Yellowstone expedition are to be paid by Major Candee, U. S. Paymaster. He went to St. Paul, Minn., for the funds last week.

—Uncle Sam has negotiated with the "Crows" for 6,000,000 acres of land in Montana for \$100,000.

—Assistant Surgeon, A. A. Yeomans, stationed at Fort Garland C. T., Sept. 5, was sent under escort to the National Insane Asylum, Washington.

What is the difference between a bald head and a starving beagle?—One is found without hair; and the other is found without fare.

Can buffalo killing be good for business?

Art and Drama.

THE appearance of Salvini in "Othello" has been the theatrical sensation of the preceding week, and, although his splendid abilities have not, we think, received the recognition from the press they justly deserve, still, he has made a splendid impression, and satisfied the true lovers of the drama in its best estate that intellectual performances still hold their sway over the hearts of the people. He will create a revolution in favor of "something better than sensation and scenery, and we already see indications that we believe will end in the revival of the production of legitimate drama. Our readers will remember that, up to the time of Ristori's appearance, Mrs. Lander and Mrs. Bowers were without engagements; but after the Italians gave "Elizabeth," the English version was called for, and the two ladies we have mentioned filled successful engagements for one or two years.

One of the interesting events connected with Salvini's appearance is, that we have had the pleasure, for the first time in New York, of witnessing a play laid in Italy by Shakspeare, illustrated by the Italian mind. A great deal of interesting writing might be produced to show how differently the warm-blooded Southerner translates the passions, compared with the colder northern natures, and certainly Salvini and his company have given us commentaries that will make a lasting impression on all who saw them. In the first scene Othello is a thorough gentleman, a man of great attention to etiquette, princely in his bearing, and of such heroic stuff, that we do not revolt at the fact that he won the heart of the gentle Desdemona. This phase is the artificial product of a nature, wild and of untamed stock, and it is a magnificent study to notice how the Moor, in Salvini's hands, after having had his coarser nature roused by suspicions against his wife, gradually becomes the thorough savage again; his civilization only adding to his innate cunning an inborn barbarism. Of the wonderful differences displayed by the Italian, over the traditionary manner of Garrick, Cooke, and the elder Booth, we will only mention the scene of the murder of Desdemona. Salvini's Moor dwells upon the contemplated sacrifice with the gloatings of a hungry tiger, toys with his victim, until the audience is filled to the verge of horror, and all this is done directly before the audience foot-lights, fifty feet away from the suspended draperies that hide the couch. At an unexpected moment the Moor makes his long contemplated spring, seizes his victim, and bears her roughly across the stage, just as a tiger drags the terrified kid to the jungles, and plunges her—to the great relief of the now painfully wrought-up audience—behind the curtains. In the dead silence which ensues, the faces of the audience blanched with imaginary murder, enacted, but for details, left to their own imaginations, and when the Moor, having accomplished his bloody work, in answer to the call of Iago's wife, with a face the impersonation of horror and remorse, peeps from behind these curtains, the dramatic climax is complete. Nothing could be more effective, more thoroughly cruel, yet most refined; making Shakspeare's stage directions, and the following of them by the great tragedians, of smothering Desdemona before the audience, by contrast a vulgar tenement-house murder.

As most of our active critics of the press have never seen any of these higher demonstrations of the power of the actor over the audience, they were, and are evidently bewildered; one went so far, we understand, as to denounce Shakspeare's tragedies, as not intended for the stage, only to be read in the closet. But tradition, regarding the power of delineating the human passions by these great masters, though they now seem exaggerated, are not, probably, up to the truth. We saw the elder Booth in "New Way to Pay Old Debts," so fearfully earnest in the last scene, that the entire stock company, including Mr. Blanchard and Mrs. Hamblin, lost their presence of mind, and followed the fainting, dying form of Sir Giles off the stage, to see the end of the tragedy.

We have precedents of the effect of this intense style, in the remarkable anecdote relating, that Kit North, Byron, Kelly, and Keats went one night to Drury Lane, to witness the elder Keene, in "Richard the III." As the play progressed, Byron became so excited that he violently clutched the shoulders of those beside him, and finally, in the ecstasy of his emotion, fainted away, and was carried insensible from the house.

Because we have no stage where the mirror is held up to nature in its highest developments, it is a mistake to suppose that nature has ceased to exist; hence, it has but imperfect recognition before the foot-lights.

No changes have taken place in the theatres this last week, except at the Grand Opera House, where the production of a new "crowning sensational and romantic spectacular drama," entitled the "Haunted House," was, for the first time, enacted on Tuesday night. This constant succession of sensational scenery plays, shows that the public never seem to tire of them. How would it do to have the scenery run in and out upside down, and the actors perform on their heads? The patent right demanded for the suggestion.

BROOKLYN.

The new Park Theatre is giving, with great success, the best English comedies. The Brooklyn Theatre is doing the legitimate in tragedy.

Mr. Wallack is to appear at the Park in a local play.

It is announced that Nilsson, with her troupe, will appear in Brooklyn, at the Central Congregational Church, on the 23d of October. One would think we were to have sacred concerts.

DRAMATIC NOTES.

Miss Rose Eying appears in a new play at the Union Square Theatre, October 1st.

On a provincial concert given awhile since, three *encores* were accorded to three musicians, each responded to for different versions of "Home Sweet Home." On the occasion it was understood that Miss Kellogg, soprano, intended to sing that favorite air, but the audience *encored* a musical instrument solo, and the performer answered with "Home Sweet Home." Miss K. remonstrated. A very celebrated pianist followed, and to the *encore* which greeted him, he replied with "Home Sweet Home," with splendid variations. Miss K. became indignant at this second interference with the programme, gave the vocal version of the great English melody, and the audience, for the third time, treated the popular musician with enthusiastic applause, which was answered by a repetition.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

THE DANISH STORY TELLER. Hurd & Houghton. Riverside Press, Cambridge, Mass.

One of the most remarkable men of the age is Hans Christian Andersen, the Danish story-teller. He strictly belongs to what may justly be called one of the line of men of genius, the founder of a school of literature for children, well known by his writings throughout Christendom, and by his presence not only in Denmark, his native country, but in the literary, artistic, and court circles of France, Germany, England, and Italy, where his *naïveté* and unaffected simplicity of affection have made him known and honored. He was born in Odense, Denmark, on the second of April, 1805, in the one room which his father and mother occupied, which served alike for house and shoemaker's shop. He left town at a very early age to seek his fortune, and in 1867 he was received in Odense as the guest of the citizens. The houses were all illuminated, a banquet was given in his honor, and he was presented with the freedom of the city. In the sixty-two years that lie between these dates, and in the six years since then, is the story of a life full of varied lights and shades. His father was a young man of poetic mind, always hungering after a richer life than that of making shoes; his mother a simple, superstitious, and affectionate woman. In their one room began his life, and his earliest recollections furnished him with scenes which afterwards he wove into his stories. "Our little room, he says, 'which was, almost filled with a shoemaker's bench, the bed, and my crib was the abode of my childhood; the walls were, however, covered with pictures, and over the work-bench was a cupboard containing books and songs; the little kitchen was full of shining plates and metal pans, and by means of a ladder it was possible to go out on the roof, where in the gutters between our house and the neighbor's there stood a great chest filled with soil, mother's sole garden, where she grew her vegetables. In my story of the 'Snow Queen' that garden still blossoms.'"

He grew into a tall ungainly lad, as shy as a girl, and yet so simple-hearted that he was ready to confide to the utmost in anyone who smiled on him. At a charity school he learned just a little, but that little so carefully that long afterwards he suffered for the lack of such common knowledge even as how to spell. It was now, too, he began to associate more with others, and like his companions, to go through catechism, preparatory to confirmation. He tells a little story here of himself, which shows whence "The Red Shoes" came from. "An old female tailor altered my deceased father's great-coat into a confirmation suit for me; never before had I worn so good a coat. I had also for the first time in my life, a pair of boots. My delight was extremely great; my only fear was that everybody would not see them, and, therefore I drew them up over my trousers, and thus marched through the church. The boots creaked, and that inwardly pleased me; for thus the congregation would hear that they were new. My whole devotion was disturbed. I was aware of it; and it caused me a horrible pang of conscience that my thoughts should be as much with my new boots, as with God. I prayed Him earnestly from my heart to forgive me, and then again thought about my new boots."

When he set out for Copenhagen, he had a little sum of money and his confirmation suit, and unbounded confidence in every one. He had an innocent way of going right up to people and asking for what he wanted. The theatre was to him the most beautiful place in the world; and he was ready to do anything that would be in place there—dance, sing, or act. So he went to the manager, and asked for an engagement. The manager looked at him, and said, "Ho, you are too thin for the theatre." "Oh," replied Andersen, "only engage me, with one hundred rix dollars salary, and I shall soon get fat." From this time, the poor boy lived, he scarcely knew how, but he was possessed of the rare quality of attracting people's attention by his ingenious drollness. He at least had the good fortune of attracting the attention of good Councillor Collin, who took him as his own son and began to educate him. He here collated his odd conceits, and his grotesque fancies took shape; the boy student became the man of power. His plays—for he wrote them now—appeared upon the stage, and were acted. He now commanded attention, and this simple childlike boy became eminent as a writer of children's stories which have since found a tongue in many languages. The old legends of his country are revived again, and he has given to the world the keen amusement of many an hour. Among his stories we may name—*The Improvisatore*; *The Two Baronesses*; *O. T.*; *Only a Fiddler*; *The Constant True Soldier*; *The Top and the Ball*; *Old Shut Eye*, and many others.

Hurd & Houghton have recently issued *The Story of my Life*, with portrait; a valuable and intensely interesting work, which we recommend to our many readers, as deserving a place in their libraries, and which should have a prominent place in every household.

The entire series of his works, are comprised in ten volumes, crown octavo size, two of which, *Wonder Stories*, are elegantly illustrated. The volumes are sold separately, the price for the series being \$18.75.

THE OXFORD METHODISTS. One vol., 8 vo., 416 pages. By Rev. L. Tyeman. New York: Harper & Bros.

All who have read *The Life and Times of John Wesley*, by the same author, will hail this work with pleasure. Those who have read the wonderful history of the great Methodist movement of the last century, will be glad to welcome this supplementary work, which so clearly and plainly throws much light upon one of the greatest events in the history of religion. Many old and pleasing memories of men eminent and great, who labored so hard in that grand work of reclaiming the English masses, the laboring men of what was termed the Georgian era, from a deeper slough of despond, than that Bunyan describes in his *Pilgrim's Progress*—the depths of a wretched materialism—these men are not forgotten. Their names shine with an undiminished lustre. These were among the great men of the times, and by their works of kindness are they known. We welcome this volume as one sure to do good. When we read of such men as James Hervey, one of the old Oxford Methodists in this work, when such old golden memories are again revived, we are sure a good work will go on and prosper even to the end.

OLDPORT DAYS. By Colonel Higginson. Boston: James R. Osgood & Co.

This collection of very lively and highly interesting historical and

other stories, ten in number, is like the call of old and remembered friends whom we are always glad to hail, and this collection of the old times and localities of Newport, has for all lovers of Colonel Higginson's writings and stories (and who does not love to read them), a double interest when presented in this new and very acceptable form, by Osgood & Co. To all who know Newport, it is pleasant, to follow the author again in his tour of observations about the old place. Here we have *Oldport Wharves*; *The Haunted Window*; *A Driftwood Fire*; *An Artist's Creation*; *In a Wherry*; *Madam Della's Expectations*; *Sunshine and Petrarch*; *A Shadow*; *Footpaths*; *Oldport in Winter*.

These sketches and stories will be new to a large portion of our readers, and the publishers are entitled to much credit for the beautiful and appropriate style in which the book is issued.

Mr. Higginson has long possessed the reputation of being one of our best writers, and we are much gratified in welcoming to public notice these stirring memories and scenes of New England. We would like to notice this work at length, but have to content ourselves with only a short extract.

"The hat is, here, what it is still in Southern Europe—the lineal successor of the sword as the mark of a gentleman. It is noticed that, in going from Oldport to New York or Boston, one is liable to be betrayed by an over-flourish of the hat, as is an Arkansas man by a display of the bowie-knife. Woman's faces are apt to take, from old age, a finer touch than those of men, and poverty does not interfere with this, where there is no actual exposure to the elements. From the windows of these old houses there often look forth delicate faded countenances, to which belongs an air of unmistakable refinement. Nowhere in America, I fancy, does one see such counterparts of the reduced gentlewoman of England—as described for instance, in "Cranford,"—quiet maiden ladies of seventy, with, perhaps a tradition of beauty and bellehood, and still wearing, always, a bit of blue ribbon on their once goldened curls—this head-dress being still carefully arranged, each day, by some hand-maiden of sixty, so long a house-mate as to seem a sister,—though some faint suggestion of wages and subordination may still be preserved. Among these ladies—as in "Cranford"—there is a dignified reticence in respect to money matters, and a courteous blindness to the small economies practiced by each other. It is not held good breeding when they meet in the shop of a morning, for one to seem to notice what another buys. These ancient ladies have coats-of-arms upon their walls, hereditary damasks among their scanty wardrobes, stores of domestic traditions in their brains, and a whole court-guide of high-sounding names at their fingers' ends. They can tell you of the supposed sister of an English Queen, who married an American officer and dwelt in Oldport; of the Scotch Lady Janet, who eloped with her tutor, and here lived in poverty, paying her washerwoman with costly lace from her trunks; of the Oldport dame who escaped from France at the opening of the revolution, was captured by pirates on her voyage to America, then retaken by a privateer and carried into Boston, where she took refuge in John Hancock's house. They can describe to you the Malbone Gardens, and as the night wanes and the embers fade, can give the tale of the Phantom of Rough Point. Gliding farther and farther into the past, they revert to the brilliant historic period of Oldport, the successive English and French occupations during our Revolution, and show you gallant inscriptions in honor of their grandmothers, written on the window panes by the diamonds rings of the foreign officers."

THE FAIR GOD. By Gen. Lew Wallace. Boston: James R. Osgood & Co.

This is not what may be strictly called a sensational novel, and the lovers of mere sensationalism, will perhaps be disappointed in not finding intense and passionate emotions, and these subjects treated in that high toned style, found in the description of all modern love stories. In this they will probably be disappointed, for the heroine is made to act and talk like a rational, reasonable girl. This work has much of an historical character, as it delineates in a pleasant, concise narrative many interesting events of the period called Aztec life; the Mexican conquest, by Cortez. No one who has recently written upon this subject, has or can produce a more readable work upon this interesting race, than the author of this book. This work will bear a careful re-reading with pleasure and profit.

CALIFORNIA. A book for travelers and settlers in California. By Charles Nordhoff. New York: Harper & Bros.

We are very glad to see in a beautiful and fitting binding this finely illustrated work by Nordhoff. Although some portions of the same have heretofore graced the magazine, it is nevertheless new to many, even who have read it before. It deserves a prominent place upon the centre table of our New York and Boston friends.

POPULAR SCIENCE MONTHLY, October. New York: D. Appleton & Co.

This Magazine is at hand, and is an unusually interesting number. From the very beginning of this work the interest and value of the same has been an acknowledged fact: scattering its light and scientific information far and wide, with an undimmed lustre. We are always sure of something solid, and satisfactory when we open a new number of this work. The number for October is particularly interesting as containing a very interesting article upon the moon, by Proctor, with graphic illustrations, which taken with the text makes the wonderful phenomena of the moon and its surroundings like an open book. This article is of itself worth the price of the volume. Astronomy has for years been called a dry, prosaic study; let any one read carefully this article and he will rise from its perusal with the conviction, that there is a literature, as well as law, to the astronomical world. This article amply redeems astronomy from the charge of "dullness," for since the hour the "morning stars sang together with gladness," the golden legends of the heavenly bodies, in their wonderful orbits have been like to one grand epic of the omnipotent power of God as revealed in the wonders of the heavens. This number contains many other very interesting papers of much value, which we reluctantly pass at this time.

THEY MET BY CHANCE. By Olive Logan. New York: Adams, Victor & Co.

This is one of the most absorbing books of the day. It may truly be called the story of a heart. It is forcibly written, and will have a large sale, as it possesses all the elements of a first class novel. There is a spice of real fun, running through this work rarely found, and for originality, sterling sense, and character picturing, we have rarely seen its equal. The contents from which something of the character of the book may in a measure be judged, are as follows, viz:—"The Man from Osh-cosh;" "The Chicago Hog Merchant;" "The Horse Mad Quaker City Gent;" "The Two Society Belles;" "The California Widow;" "The Man She Netted;" "The Pious Sewing Woman;" "The Pacific Sport." 1 vol., 12 mo; Cloth \$1.50.

ANNOUNCEMENTS.

As the Christmas and New Year's holidays draw near, the cursory notes of preparation among the publishers are heard and seen. The House of Hurd & Houghton, Riverside Press, Cambridge, have in press, and will shortly publish quite a number of valuable and interesting works. Among them we notice *Bianca Cappello*: A tragedy in five acts, by Elizabeth C. Kinney. The fair authoress is well known to the reading public through her poems, and her newspaper communications, written during her many years' residence in Italy. Her drama was composed at Florence, the land of romance and story. It reveals a deep and sad story, in which the tragic element is intermingled with the love and hate of the beautiful and guilty Bianca.

THE GRAMMAR OF PAINTING AND ENGRAVING. Illustrated from the pencil of Charles Blanc, "Grammaire des Arts du Dessin." By Mrs. N. Daggett. With the original illustrations, in one volume, quarto.

This will be a fitting companion for Mrs. Clement's Handbooks. The illustrations are exceedingly beautiful and of great value to the art student.

THE TWO SUCCESSFUL BOOKS OF
THE SEASON.

I.

Hallock's Fishing Tourist,

The Fishing Tourist, Angler's Guide and
Reference Book.

BY CHARLES HALLOCK,
Secretary of the "Blooming-Grove Park Association."
ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who
write a book mainly for the reason that they have some-
thing to write about—have something to tell the public
which the public desires to know. The shortest routes
to pleasure are laid down, and correct information is
given as to the best means of conveyance, the expense
of the trip, the secrets of the commissariat, etc. The
author has avoided the use of technical terms, and thus
made his volume all the more acceptable.—*Turf, Field*
and Farm.

II.

Prime's I Go A Fishing,

I Go A Fishing, by W. C. PRIME, author of "Boat Life
in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO., CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vig-
orous descriptions of scenery and character, is distin-
guished by a refined wit, a droll humor, a strong love
of the beauties of nature, and an enthusiastic devotion
to the piscatorial sport. This book will please all who
admire heartiness of style and exuberance of anima
spirits in their authors. There are some interesting
and well-told stories scattered through the volume,
which exhibits on almost every page the handiwork of
a man of graceful culture and wide reading.—*Boston*
Daily Globe.

Published by Harper & Bros., N. Y.

HARPER & BROTHERS, will send either of the
above works by mail, postage prepaid, to any part of
United States, on receipt of price.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designating the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even clamor for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

Mr. SIMEON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

REMINGTON'S
Sporting, Hunting and Target
Breech-Loading

RIFLES & SHOT GUNS

Long Range Match Rifles for "Creedmoor" Shooting, now ready. The same as won the "Turf, Field and Farm" Badge, Aug. 2, and "Amateur Rifle Club" Badge, Aug. 9. See reports. Unequalled for accuracy by either Breech or Muzzle-Loaders of other makers.

For simplicity of mechanism, ease of manipulation, quality of workmanship and material, accuracy of range, and penetration, WITHOUT COMPARISON.

"It is a noteworthy fact that though many different kinds of rifles were used in the several matches, including the converted Springfield, Remington, Metford, Ballard and Ward Burton Rifle, every prize in all the matches was won by those who fired with the Remington rifle, except the last."—From N. Y. Times, June 22, 1873.—(See full report.)

The Remington Rifle won Twenty-two out of Twenty-three Prizes at the Creedmoor Meeting, June 21, 1872.

Also, Revolving, Repeating, Deringer, and Vest Pocket

PISTOLS & RIFLE CANES.

THE FASCINATION OF FISHING.

COULD I lend the fascination
That this solitude enshrines,
In its rest and recreation,
In the typographic mines,
You would leave the pen and book
And would sally with your hook
To this bright, enchanting brook
Here to revel in these lines.

Could you study from creation
These grand books of nature's lore,
As she crowns with rare ovation
Hill and dell and meadland o'er,
You would daily find some treasure—
Daily find some hidden pleasure—
That in an exhaustless measure
Onward reaches evermore.

You would leave the lab'ratory,
Where such miracles are wrought;
And the bears of modern story,
That the bulls so well have fought—
You would with complacent wishes
Leave to speculative dishes
While you feasted on the fishes
That your lucky hand had caught.

There's a mighty charm in fishing,
Though your cheek should change to dun,
But much like the charm of wishing,
'Tis in catching lurks the fun.
One forgets the sumptuous dishes,
As one does the crowned wishes,
Hence, in fishing more than fishes
Is the fascination won.

SEPTEMBER 10th, 1873.

MARTHA EWING.

Down the Potomac.

NO. II.—THE MARYLANDER AND HIS CANOE.

LOWER Maryland has never recovered from the disasters of the late civil war. This is in some measure due to the people themselves, but in large part to the scarcity of labor. During the war the negroes in the counties bordering on the Potomac were swept into the army. When they did not leave their masters voluntarily force, was used. Recruiting parties were sent into the interior by order of Major General Benjamin F. Butler, and the negroes were marched in gangs to Piney Point or Point Lookout, from whence they were shipped to Fortress Monroe. The "old families" were thus left in sad plight. Ladies who had never combed their own hair, or tied their own shoes, found themselves confronted by a formidable array of household duties. There were fires to be made and food prepared ere hunger could be satisfied. The men of the household, who had never known more arduous toil than riding at a tournament, or chasing the fox 'cross country, were left with large farms on their hands—the plough standing in the furrow, the yards and barns full of valuable stock. It is perhaps hardly to be wondered at that everything was allowed to go to ruin and decay; that fields were left untilled, fences unrepaired, and buildings unpainted. The transition from ease and affluence to comparative poverty was so sudden that few have recovered from the shock. The wonder is, how so many manage to live at all on the wreck of their *ante bellum* grandeur. Few of the negroes ever returned to their former homes. They met their death in the crater before Petersburg, perished of disease, or live in vagabondage in distant States.

The staple crops of this section are tobacco and wheat. All vegetables thrive, and peaches, pears, apples, nectarines, grapes, melons, and plums come to full perfection. The Washington and Baltimore markets are readily reached by steamers, which penetrate every nook and inlet; and yet, with all these advantages, there is very little prosperity among the white population. People live—and they cannot well help it, with an abundance of game, fish, and oys-

ters at their disposal, but their dwellings grow more and more dilapidated every year, and their pockets emptier. It is hard to prescribe a remedy for this state of affairs. Skilled labor, thrift, and energy are potent in their way, but capital is needed as well to raise Lower Maryland from its slough of despond.

St. George's Island, mentioned in a former article, has a population of some forty families. The men are engaged in the fisheries and as pilots on the river. The island is some three miles in length, is nearly level, and is covered to a considerable extent by dense groves of pine. Fruit thrives here, but, save in one instance, no care is bestowed on its cultivation. The fishermen and pilots usually cultivate a little garden patch, however, and sometimes a field of corn. You will see pigs running at large, but rarely a cow, and never a horse. A canoe is to these islanders a horse and carriage combined. It takes the place of the *volante* of Havana and the gondola of Venice, and is more than either, for it is not only a conveyance, but a means of livelihood to its owner.

During the fall and winter months the oyster trade furnishes employment to all who are able to handle the tongs, sail a canoe, or man a pungy. The canoes must be licensed, under the laws of Maryland, and have their number painted on the bow. They set sail in the morning for the oyster beds, and, having obtained a load, run alongside a pungy (a class of schooners in use on the Potomac and Chesapeake Bay) and dispose of them. The price paid is ten to fifteen cents a bushel, and the tong-men are said to make from four to six dollars per day. Indeed, a colored man told me he saved \$200 out of his winter's earnings, and it is usual, I believe, to lay by enough to keep a family in provisions during the summer months. When the oyster season is over the canoes are hauled up and painted, the garden patch planted, and then the canoes are launched again, and gill-nets and fish lines are brought into use. These furnish a somewhat precarious living, but the fishing parties which come down the river pay handsomely for the services of a man and a canoe, and I have known the sheephead fishermen to average from four to six dollars per week. For small fish, they received last summer six cents per pound. Another source of profit is catching crabs for market, but the crabs were so small and scarce this year in the vicinity of Piney Point that they were left to the tender mercies of the amateur fishermen. Let me here point out a mistake some make in cooking this shell fish. They should not be boiled like potatoes, but placed in a pot without water, with salt and pepper thrown over them, their own moisture being all that is required. They are still better when baked or roasted on a hot stove or in an oven.

To say that fifty cents will go as far at these unfashionable resorts down the Potomac as a five dollar bill at the fashionable watering places, is hardly an exaggeration. One morning, wishing to go fishing, I engaged two boys to catch soft crabs for bait. They explored the shore for some distance with poor success, having found but three or four. However, I was bent on trying the fish that morning, and so took what they had, telling them to catch more, if possible, and bring them to the store, when I would pay for all. *En passant*, I didn't catch a fish that day. About dusk the boys put in an appearance at the store with soft crabs enough to complete a dozen, the result of a good half day's work. Asking their price for the bait, I was astonished when they replied, "Ten cents." That was too absurd; so I said I can't pay that, but if you will take twenty-five cents here it is. Hearing a part of the conversation only, Mr. Marshall, who was writing at his desk, turned and denounced the boys for asking the exorbitant price of twenty-five cents for a dozen bait crabs. The youngsters looked quite shamefaced for a moment, but stammered out that they had only asked ten cents. On another occasion I was beating up the St. George's in a canoe against a strong head wind, when my companion's hat blew overboard. As it was only a common straw—value, thirty cents—and we were a mile from home, and dinner nearly ready, we concluded to let it go. Soon after, however, we met a canoe, with a young fellow at the paddle,

bowling islandward and homeward with a fair wind. We hailed him, and told him if he would get the hat and bring it to the store we would give him ten cents. Without a moment's hesitation he started after it. By the time he had secured it he had a good mile and a half to sail against half a gale of wind. But he restored the truant head-gear to its owner, and seemed well satisfied with the promised reward. It is sad to think that these unsophisticated natures must become contaminated in course of time. Even a solitary bloated bondholder would entail irreparable evil upon these peaceful havens of respectable impecuniosity—the unfashionable summer resorts down the Potomac.

It is high time I gave a full, true, and particular description of the canoe peculiar to the Maryland and Virginia waters. Without the canoe, summer life on the Potomac would be unendurable. This indispensable craft is a dug-out, but bears about the same relation to a dug-out of the South that a clipper ship does to a mud scow. The dug-out is made from a single log, the canoe from two, three, four and upwards. The majority of those in use on the Maryland shore of the Potomac are made of two logs. No models or moulds are used in building them. The logs are squared and fastened together, and then shaped out by the eye. The canoe is made sharp at each end, but with finer lines at the stern than at the bow. When the outside is shaped the two halves are dug out separately, and afterward put together with hard wood trenails. The sides and bottom vary in thickness, in different canoes, from three to six inches. The keel, stem, and stern post are now put on, and the washboards and seats fitted. Whether intended for one sail or two, the foremast is always stepped in the extreme bow, and the mast-hole in the seat is made large enough to allow of considerable play fore and aft. When on the wind a wedge is put in before the mast to give it rake, but when before the wind the mast is raised and the wedge inserted behind it. The mast is just long enough to rest upon the seats inside the washboards when unshipped. A leg of mutton sail is used, rarely made to hoist, but attached to the mast by cord or canvas bands, and set with a sprit. When two sails are used the mainsail is rigged in precisely the same way, but is very much smaller than the foresail. If a jib is carried the bowsprit is made of a tough bit of oak, mortised to fit over the stem, and held in position by a peg or nail. No stay is used, the jib being attached to the bowsprit, and the halliards passing through an eye or small block strapped to the foremast. The jib sheets trim aft through holes in the knees that support the washboards. Some of the canoes have centre-boards, and others are without; some have rudders, and others are without. But whether a canoe has a rudder or not the great dependence is on the paddle—material, oak; regulation length, eight feet; in shape, a cross between an Indian paddle and an oar. The blade, gradually narrowing, extends fully two-thirds the length, and its extreme width does not exceed that of the oar in ordinary use. Any one who has sailed a canoe with both the rudder and paddle will find that this kind of craft can only be successfully navigated with the latter implement. The canoe without a jib, and the majority do not carry that sail, has a tendency to keep in the wind, which the rudder is often powerless to counteract. But with a paddle over the side you can give a few quick strokes, or a succession of slow ones, which will keep the stern to windward and prevent leeway. Then, in going about, with a rudder the chances are that you will miss stays, and before you know it the canoe will be under stern way. With a paddle you have only to loose your hold and let her come up in the wind, and then, shifting the paddle by an easy motion of the wrist to the other side of the stern post, a few sharp strokes will cause your sails to fill, and away you go. Still, it requires muscle to handle the paddle when beating to windward, with half a gale blowing, and with the wind fair or free, provided the water is smooth, the rudder answers every purpose. But in rough water—and it is sometimes very rough on the Potomac, so rough, in fact, as to compel good sized schooners to seek a harbor—the rudder is perfectly useless, as it is half the time in the air, while the paddle may always be

kept submerged. When live ballast is not to be had sand bags are used. They are laid upon the windward washboard, and, overhanging slightly at each end, they remain firm in position. The helmsman also throws his weight on the windward side, and thus ballasted the canoe will carry all sail when larger craft find it necessary to reef. But it sometimes blows too hard for the canoe, and then a shelter is sought, the sail furled, the mast unshipped, and the anchor thrown out. In the event of a sudden squall, when even a second's delay is dangerous, mast and sheet are tossed overboard, and the sheet, being made fast aft, holds them alongside until the fury of the storm is spent, when sail is set again. There is no way of reefing the canoe's sails, but when the foresail cannot be carried the mast is unshipped and the mainmast stepped in its place. After spending two months and a half in these canoes, having previously had much experience in yachting, in large craft and small, I can testify to their remarkable speed, strength and weatherly qualities. With reasonable care, protection from worms being most important, it is obvious they must last a lifetime, while no other craft is so well calculated to withstand the wear and tear of oystering. As for speed, I made the trip from Piney Point to Marshall's, a distance of fully two miles and a half, in fifteen minutes—that is to say, it was fifteen minutes from the time we cast off from Piney Point wharf until we passed the end of Marshall's wharf. It took one minute more to round up and land upon the wharf. The canoe was of the smallest class, and carried but a single sail. On this occasion I had one passenger, and he was kept busy bailing until we passed from the Potomac, through the Straits, into the St. George's river. On a straight course, and for shorter distances, even better time has been made. I write only of what I know, but may mention that a party of three claimed to have sailed in a canoe from Point Lookout to Marshall's, distance fifteen miles, in one hour and ten minutes. It was blowing a gale at the time, but it is incredible that a small canoe, with a single sail, could have been driven through the water at that rate of speed. Those who choose to believe the statement—I do not—can do so.

Staunch and safe as are the canoes when manned by experienced hands, there must necessarily be times of peril and hairbreadth escapes when one tempts the elements daily and nightly. Of these I had full share during my sojourn at Marshall's, for I almost lived in my little canoe, the "Bluebird," which, though the smallest of the fleet, was more than a match for the largest. She carried her canvas nobly, too, but a wetter craft in a gale or rough water it would be hard to find. She was so sharp forward that she would bury her bow under and take in water by the bucketful, and keep one man bailing constantly. Despite this well-known fact, I never wanted for passengers in the roughest of weather, even among the ladies. Braver women I never met—they put even the men to the blush. One dark night I started homeward from Piney Point with two passengers, husband and wife. The Potomac was unusually rough, the wind blowing half a gale, and I began to fear for the nerves of my passengers. Three canoes had started before us, the first having been gone at least ten minutes, and as the "Bluebird" shot out from the wharf, and, feeling the full force of the wind and sea, dipped her lee washboard under and scooped up the water with her bow, I had little hopes of overtaking them. The water was soon over our ankles, but it was not safe to change position to use the bailer, and so it was allowed to swash backward and forward. We were enveloped all the time in showers of spray, and my lady passenger, being in an exposed position, occasionally was struck by a sea, drenching her from head to foot. This she did not seem to mind in the least, and when near the mouth of the Straits I caught sight of a sail to leeward and exclaimed, "I believe we shall beat them after all," she burst forth with "Beat them, beat them; I don't care if I get wet through, and everything I have on is spoiled, if you will only beat them." Of course I did my best. The canoe to leeward was the "Pocomoke." She was soon disposed of, and on entering the St. George's the "George Washington" was overhauled and passed as if she had been anchored. When we reached the wharf the "Gibson," which left some time after the "Pocomoke" and George Washington," but two or three minutes before the "Bluebird," had just arrived, so that in time we beat the fleet, and my lady passenger was wet to the skin, but happy.

Later in the season I made a more eventful trip. The R. family were to take the steamer one Friday night for Washington, and I had promised to take them over to Piney Point in the "Bluebird." The steamer was due at the Point at midnight, so that it was not necessary to leave Marshall's before ten o'clock, or even later; but at dark the weather became very threatening, and everybody predicted a severe storm. I therefore advised Mr. R. to send his wife and children in one of the larger boats, or by wagon, but said I should make the trip myself and would take a passenger or two, provided they had nerve and could swim. I had got up sail and was laying alongside the wharf awaiting the movements of the other canoes when Mr. R. came down and began putting his family on board. I did not like the responsibility thus thrust upon me, but was glad of such pleasant company. I called up a young man whom I knew to be an expert swimmer to accompany me, and then pushed off with Mrs. R. and two children. It was plain sailing enough down to the Straits, though the fitful gusts which now and then struck the sail gave warning of what was to come. From the lee side of the Straits it was possible to make Piney Point wharf with the sail trimmed flat; but as this course was near the shore, where the water was roughest;

and as I feared that "Bluebird" could not carry her canvas if close on the wind, I tacked and made the weather side of the Straits, and being there sheltered by St. George's Island trimmed my sail aft, and headed a long way above my point of destination. By this means we were enabled to make the trip without a wetting or serious danger, for when we lost the shelter of the island we were so far to windward that I could ease off sheet gradually, as the wind increased, and when we finally headed direct for the wharf, we had the wind at our stern. The waves were rolling high, and as the spray flew ten or twelve feet up the shore, it was impossible to land on the beach, as we had intended, so we made fast to the wharf, the cap of which was above our heads, it being low tide, and as there were no steps the passengers had to be lifted and pulled up bodily while the canoe was jumping about in the liveliest possible manner. However, the debarkation was accomplished, and there we stood anxiously upon the wharf with eyes piercing the gloom for a glimpse of the boats that started after us. Soon the sound of voices was heard, but it was not until some time that we discovered a boat, which proved to be the "Aurelia," a flat-bottomed, sharp-bowed craft, on the shore a short distance below. Before she could be pushed off her passengers, mostly ladies, were thoroughly drenched with the spray that broke over her. As her sail filled and she stood off shore she was lost to sight; and mind, too, for just then the "Pocomoke" hove in sight and came under the lee of the wharf. Now we began to feel anxious about the "Aurelia" and her precious freight. Minute after minute passed, and she did not appear, but as we were about to send the "Pocomoke" to the rescue, she bore in sight, and her demoralized passengers were soon though not without difficulty, landed upon the pier. It seems that while ashore her center-board was raised, and left up, and the fact was not discovered until the boat had drifted a long distance to leeward.

The wind had been steadily increasing all this time, and as we looked out over the troubled waters of the Potomac for the steamer's lights, the prospect for the trip home appeared anything but favorable. At half-past twelve the steamer having come and gone, and our friends departed in her, preparations were made for returning to Marshall's. The step which held the Aurelia's mast having worked loose she was declared unseaworthy and it was decided to leave her alongside the wharf. This left only the "Pocomoke," and "Bluebird" available. As skipper of the latter, I proposed to take one gentleman with me, provided he could swim. The only volunteer I had was a lady, who quite insisted on going, but whom I positively refused to expose to the dangers of such a trip in so small a craft. The proprietor of the Piney Point Hotel, and some of his guests, did all in their power to prevent any one of us from facing the storm. I have several times mentioned a half a gale of wind, but this was a full-fledged gale, with a night dark as pitch, and waves rolling as I had never seen them on the Potomac. However, the result of it all was that I started off first, alone, in the "Bluebird," carrying the "Pocomoke's" mainsail, in place of my own mast and sail, which were laid inboard. Two ladies and one gentleman were to come after in the "Pocomoke," with Jim Middleton, a trusty colored man, at the helm, and the remainder of the party—including several gentlemen, to their shame be it said—were packed into a two-seated wagon for an overland trip. So far as my personal experiences are concerned I never faced a wilder night. The "Bluebird" carried her canvas well enough, but the waves caught her up and tossed her about as though she were an egg shell, the rudder having no hold at times; and then the spray, not to mention the buckets full of brine which occasionally struck me full in the face, so blinded me that all I could do was to cling with one hand to the washboard, the other grasping the tiller, and let her go. So violent was the motion that had I not held on I should certainly have gone overboard, and I expected every moment the canoe would go bottom up. It was like being tossed in a blanket. Fortunately the wind held so that I could lay the course for the Straits, but I had to sail it from instinct, there being no land-mark, visible to guide me. When I did enter the Straits they were white with foaming breakers from shore to shore. Through there, with the wind dead-aft, the "Bluebird" flew with the speed of a race-horse, and once more in the placid waters of the St. George's I breathed freely. I was wet to the skin from head to foot, and the canoe was full of water to within three inches of the gunwale, but I had braved the severest storm of the season, learned what a canoe can do, and was happy. The "Pocomoke" arrived not long after me, her passengers dripping but better satisfied with themselves than were those who had shown the white feather and taken to the wagon. I mention these incidents to show that canoeing on the Potomac is not all fair weather sailing; and with regard to the frequent use of the personal pronoun I may say that I prefer to write of what I know rather than of what I hear. Others may have had even more eventful canoe voyages, in which case I hope they will narrate them for the entertainment of the readers of FOREST AND STREAM.

A word or two as to the cost of canoes: A two-masted, centre-board canoe, fully equipped may be bought for from \$75 to \$125. The price, of course, depends upon age, condition, etc., as with other craft. St. Mary's County, Maryland, is said to own the fastest and handsomest canoes, but strange to say they are mostly built on the Virginia shore, a short distance above Norfolk. They may be bought from the yards there, the hulls alone, unpainted, for \$20 or \$30.

In conclusion let me commend the St. George's Hotel, Piney Point, St. Marys Co., Md., to sportsmen who may conclude to visit the lower Potomac. Terms are moderate,

and R. J. Marshall, the proprietor, is a whole-souled fellow. The steamer Georgianna, leaving Baltimore and Washington once a week, lands passengers at Marshall's wharf.

CHARLES A. PILSBURY.

SPORT ALONG THE NORTHERN PACIFIC.

BRANARD, MINN., September 23, 1873.

EDITOR FOREST AND STREAM:—

The great enterprise of the day in this far-away country, the Northern Pacific Railroad, its princely land grant, its miles and miles of garden-like prairie, its leagues and leagues of pine forest, its mines of gold, silver, and coal beyond the Missouri, its (even now) enormous carrying trade, its gold bearing lands, &c., &c., have been advertised far and wide, and now something should be said regarding it from a sportsman's point of view.

We have in quest of sport with the rifle and the rod roamed over a vast stretch of country, from the Thousand Islands to the gulf of St. Lawrence; have put our line in in nearly every lake and stream in the Adirondacks from the base of the Lonely Mt. Seward, to Lou Fuller's homelike place on ever-to-be-remembered Meacham lake; have still-hunted the deer, and followed the lordly moose amid the forests of the upper Ottawa and Covlonge; but we never have had better or more diversified sport, than here along the line of the Northern Pacific Railroad, during the last three years. Let us take the route from St. Paul in the morning; a few hours ride brings you to the Northern Pacific Railroad Junction; a few miles from here occurs the first lake. Island lake, two bodies of water, full of fish, bass, pike, perch, and pickerel, and where the lakes join at the south end, is a large field of wild rice, a splendid place to shoot ducks as they fly back and forth. Stopping at Withington station, a half mile walk takes us to Serpent lake, the lake of all others in the country, for the finest game-fish we have, the black bass. This lovely lake two years ago was almost unknown to the white man; its cold crystal waters had never known the touch of the keel of any craft save the bark canoe of the Chippewa; the writer and a friend put the first row-boat in the lake, and in one short happy afternoon caught one hundred and seventy-eight bass and two maskalonge, with which we made glad the hearts of our friends who were too busy "to go a-fishing."

These uneducated fish will bite ravenously at anything, a spoon, a red rag, a piece of pork, or perch, any bait in fact, but the way to take them and get the most fun out of it, is with light trout tackle, a long leader with two or three red ibis flies. Late in the afternoon, towards dark, a large white fly will bring them springing out of the water, reminding the angler of past days, when he threw his fly for speckled trout at Racquette Falls, or Meacham outlet, in the Adirondacks. These fish weigh from one to six pounds, and when a couple of four pounders get hooked the fisherman must have his wits about him if he does not wish to lose his flies and leader, or have his rod broken. To stand in the bow of a steady boat, well equipped with light strong tackle, have your paddler gently send the boat around the gravelly shores in and out of the deep bays, over the stony rifts, and hook a black bass every few moments is well worth a trip to this country to enjoy.

Crossing over the Serpent to Agate lake, a forty rod carry (stopping on the way to look at the sugar works of the Indians, and may be to air our knowledge of the Chippewa language with some of the smoked Americans, we are sure to meet), brings us to a small bowl-shaped pond, very deep and containing fish very similar in quality and kind to those in the Serpent lake. It derives its name from the quantity of agates and cornelians found among the pebbles on its shores. A half mile carry from here brings us to Rabbit lake, a large body of water, very fishy, the outlet ten miles long. A sluggish stream winding through rice fields, affording good duck shooting, brings us to the Mississippi river, fifteen miles from Brainard, the young and prosperous city of the Pines, the western headquarters of the Northern Pacific Railroad Company. West from Brainard twelve miles, is lake Sullivan; named one joyous afternoon a year ago, in honor of Superintendent John H. Sullivan, formerly of the Hannibal and St. Joseph and other south western roads. Sullivan lake resembles Serpent lake in its general outlines, wooded shores and stony banks: and the fishing is equally good.

A delightful trip is to go to Aitken, twenty-eight miles east, launch your bark canoe on Mud river, following that crooked stream a mile, enter the Mississippi river, and come down stream a hundred miles to this point, getting fish, duck, grouse, and perhaps a shot at a deer or bear.

West from here to the Mississippi river, the country at this time is alive with game, pin-tail, pinnated and ruffed grouse, snipe, plover, rail, and ducks of all kinds in countless thousands. At Yargo and Moosehead, on the Red river, there are good hotel accommodations and game "till you can't rest."

Parties coming here should make Brainard their headquarters for fishing operations, catch bass and maskinonge till they are tired, take the steamer Pokegama and ascend the Mississippi river four hundred miles into the wilderness, look the country over, and then "go west," with their breech loaders into the first hunting country of the State. Brainard is situated on a high level plateau of ground timbered heavily with pines for miles around, thus being sheltered from the cold winds of winter, and singularly exempt at all times from sickness of any kind. Invalids who have been here, particularly those suffering from lung disease, have been materially benefited, and if not too far gone, if they will come here, take care of themselves, "live cleanly and eschew sack," they will renew their "lease of

life." Hotel accommodations here are good; men who know the country can be engaged as guides, bark canoes can be hired or bought, and next season boats will be for hire on Serpent and Agate lakes; and the sportsman who wants fun at a moderate cost need look no further. So we say, and we "know whereof we speak"—having "been there."

HAVILAND.

EPH. MUGGINS' STEEPLE CHASE.

EDITOR FOREST AND STREAM:—

I'm not in the fast hoss business now. It's plade. Fast hosses are good to look at, but they're bad to own. I had one once, and I don't want no more. I bought him to ride a steeple chase. I thought I had a soft thing. Nobody knowed I had a high-flyer, and so I tho't I'd lay low an' let out on em' on the day of the race, and sweep the field and make my pyle—but I didn't. When the day cum, I sauntered up to the field with the crowd on my hoss; he was the ornerest looking plug you ever see, but he could jest go like litenin' streaks. I crowded in with the other fellers, when a hoss chap spoke up, an' sez he:—

"Now keep out o' the way, young man, the race is goin' to begin."

"Well," says I, "I'm goin' to run my hoss, too."

"Have you entered?" sez he.

"I jest have that, hoss," sez I.

The crowd begun to gather round then, an' some on 'em was mity tickled; but, thinks I, 'let them laf that win.' So the feller looked in his book, an' when he found my name there he grinned a grin an' sez:—

"All right boss; you kin travel."

So when the word "go!" wuz given, away we all went, hickety goose-paster.

I never rode a steeple chase afore, an' in fact, I never rode a hossback much any way. It allus a kinder galled my feelings, and doubled up my stomick to ride in that kind o' way; but I wuz in the fast hoss business now, and wuz ridin' for stakes and not for piezher; so I dug in my heels and gripped hold of the main, and mashed my hat down on my head and switched my whip and hollered an' shet my eyes and pitched ahead regardless.

At first, two or three fellers got the start o' me, but I sailed by 'em pretty lively as we went over the first field. My old scrub was ahead anyways then, an' we begun to feel our otes. Across the field, as we come to a hi fens, I cracked my whip an' dug in my heels, an' we went at it an' cleared it in tip-top stile.

The crowd cheered like mad, an' I stratened up my stomick as best I cud, and off we went agin. Whew! how we did go. Thinks I, guess they don't laf so much now! Directly I cum to a ditch. Probly, if the ditch ed been maid for steeple chasin', they wouldn't a maid it so wide, but they engineered the thing rong, and when my hoss cum up to it, he sort o' backed up, and then he maid a dive and landed his fore feet across, but he couldn't fetch his hind feet, an' there he stood, like a spenshun bridge, with me on his back.

It wasn't so cheerful as if it had been some other hoss, with some other man on his back. What to do I didn't no. I looked round an' see the hull crowd comin' over the fense. I wanted to git off, but if I got off there I should drop in the ditch, so I turnea round and made for the rear intending to drop to the ground on the north bank of the ditch.

Just then the racers all cum up, and when they see me clamberin' down the back end of my hoss, and him bridgin' over the ditch in that way, they all bust out laffin as if they'd got fits. One feller rolled off his hoss and fell in the ditch, he was so tickled about it. I let him lay there. Another feller let go his grip an' went off jest afore he got to the ditch. I let him lay. One hoss went down in the ditch long side of the feller. I let him lay. The rest went over an' rushed on to glory an' to victory.

In the meen time, soon as my hoss felt his cargo lited, he gathered up his heels an' got over all rite. By hook an' crook I got over too, an' mounted, an' off I went agin. You bet I dug in to make up for lost time. I swung my whip, an' hollered, an' clung on with hands an' heels and begun to gain on 'em in good stile. There was a big old fense ahead, an' the first hoss that went for it fell back discouraged. The next hoss smashed through, but broke the top rail. The next hoss tried twice before he got over, and when I cum up I maid for the spot where the top rail was off an' I cleared it as easy as a grasshopper would a punkin vine, and then I give a yell that maid the fellers ahead look round, an' they wan't so much ahead eether.

When they seed me a cumin' down on 'em, like an avalanche on a flock of sheep, they looked kinder supprized. I kept a gainin' on 'em, an' directly I tore by 'em yellin' an' shoutin' like a demon of fury on a streak o' chain litenin'.

Phew! how our hosses' hpoofs clattered over the ground. How we all shouted and screamed and lashed our nags and dug in our heels and tore over the ground! Every man an' every hoss had his blood up to bilin' pint. Every mussel an' every nerve was strung as tite as a bo string. I never felt so excited in my life. I felt shure I should win the pyle, when all to once I spied an obstacle of interest afore me in the shape of a hege fense. This hege fense was originally a desent sized consarn, but had growed to a most outrageous hite and widht, and I couldn't see no soft spot nowhere to git through. For once I wuz sorry I wuz ahead, but urgin' on my firey steed, I made for the lowest spot an' went at it.

He jumped well, but he maid his calculation rong, for he landed plump in the middle of the hege, an' there he stuck, like a rat in a trap.

My gallant steed maid furious efforts to ecktrakate himself, but he couldn't ecktrakate. It was too much hege for him, and so he rezined hisself to his fate and stood stock still. I dismounted in my usual graceful stile, by the rear exit, an' got out of the brambles an' took an observation of the situation. The fellers behind me wuz comin' on like mad, an' every blessed one of 'em went clear over the hege as slick as grees.

I reckoned it wuz about three miles on to the grand stand, and so I kalkulated that if I could ecktracate my hoss I mite cum in ahead yet. Besides that it would be a mercy to the animal to git him out of the hege, where the brambles wuz prickin' him to deth. So I got under his lea hind-quarters and give him a boost, thinking to cast him heels over hed into the field beyond; bul I mite as well tride to boost a meetin' house. The hoss seamed to dislike my medlin' with his legs in that way, so he give hisself a histe, and planted his hoofs in my stomick, kind of abruptly, and the next I know about things I wuz tryin' to unroll myself in the middle of the field, about five rods from the last scene of action. I feared I could not live always, for about five minutes. This wuz hoss gratitude. My angry passions roze. I let 'em rize. I stripped off the saddle and bridle and left \$500 worth of fast hoss-flesh where I hoped it would be fast forever. I wuz mad. I didn't go back to the grand stand, but I sloped for home. I wuz scratched and bruized and soar and bilin' mad.

I never tride no fast hoss steeple-chase bizness no more. I had enuff. Yours emphatically,

EPHRAIM MUGGINS.

THE DECREASE OF EDIBLE FISHES ON THE JERSEY COAST.

PHILADELPHIA, September 19th, 1873.

EDITOR OF FOREST AND STREAM:—

The first number of FOREST AND STREAM (No. 6), it has been my good fortune to see, and I must now tell you that its racy contents were perused with a feeling of decided interest. To my mind it fills an aching void, and cannot fail to prove a success.

Among many other interesting articles, my attention was specially drawn to the communication of F. Mather on "Bass in Trout Waters," not because of any familiarity with, or special interest in the controversy, but from the fact that it led my thoughts from fresh to salt water, and from trout to sea fishes.

Prof. Baird, of the Smithsonian Institute, as is well known, has been deputed by the Government to investigate the causes which have led to the marked decline in the number of edible coast fishes. Inklings only of the result of his investigations have been obtained, but sufficient to determine that among the destructive causes are the large and continued use of the seine, and other devices for the wholesale capture of fishes; interference with them during the spawning season, and the large increased number of persons who with hook and line are almost continually engaged in a warfare against them.

Other causes have been cited, and it needs little argument to convince even the most casual thinker on the subject, that all of them combined have had the effect of depleting to a large extent waters which like those of the Adirondacks once teemed with food fishes. An illustration of the correctness of these views will be found in the growing scarcity of edible fishes in the waters adjacent to Atlantic cities, where the depleting causes referred to have largely prevailed for a number of years past, so that what were once the best fishing grounds on the Jersey coast, have become comparatively barren of finny inhabitants. Whether stringent general and State laws should be enacted for the protection of coast fishes is a question which admits of no debate.

Let me in addition to the destructive causes cited by Prof. Baird, refer to another formidable enemy—predatory fishes which so largely abound along the coast. Among them the bluefish of course stands prominent, but there is still another, and to this one I desire to direct attention. All the bays, inlets and thoroughfares along the coast, and in addition the waters of the ocean itself near the shore, swarm with sharks of large and small size. These Ishmaelites of the salt water are, as you know, insatiable. Their cruel maws are ever craving for, and their more cruel jaws continually employed in the destruction of edible fishes. The fact that sharks are rarely captured and less frequently seen in the water, is to most persons *prima facie* evidence that their number is insignificant. This is an error. My own experience and observation warrant me in making the assertion. For some twelve years, I have each summer spent a week in Delaware bay, fishing for sharks only, and with catches varying from thirty to forty, and ranging from five to eleven feet in length, each trip. One of these days, if acceptable, it will give me pleasure to give your readers an idea of what regular fishing of this character is.

What is true of Delaware bay in regard to sharks, is applicable to the bays, inlets, and thoroughfares along the coast, only in a larger sense, and such being the fact, it is not difficult to understand how greatly these hungry monsters are annually assisting in lessening the supply of coast fishes. In connection with this, it deserves to be borne in mind, that while men and sharks are waging an incessant warfare against the edible fishes, very few sharks comparatively are taken.

Some of your readers will doubtless ask, what are you going to do about it? My reply is; go for the sharks. *Cum bono?* First for the protection of the good fishes; second

for sport, and lastly for profit. Sport! What sport can there be in capturing a shark? The same query might be proposed in regard to trout, bass, bluefish, weakfish, or any other. There is genuine sport in it, and of the most exciting kind. There is a fascination about it, which to be appreciated must be practically enjoyed. If it be sport to land a three pound trout, a twelve pound bluefish or a six pound bass, what must it be to hook, play and land a three foot shark weighing forty or fifty pounds? But I will tell you all about it one of these days. Profit! What profit can there be in catching sharks? As much as in any other kind of fishing. First, the liver yields a large quantity of oil, valuable for a good many purposes. I have known ten gallons of oil to be taken from a single liver, though this was an exceptionable case. From two to four gallons is the average. The carcass is valuable for manurial purposes, when composted with earth. I estimate the value of a ten foot shark, when used as above, at not less than three dollars, provided of course appliances were at hand for the utilization of the carcass, and the "trying" of the liver. Such appliances would speedily present themselves, if shark capture were made a business, or if those who indulged it for mere sport, would turn over their catches to the manufactories. But whether for sport or profit, a warfare, in my opinion, should be inaugurated against these "sea lawyers," who make it a point, as lawyers generally do, to swallow their clients. When the wants of men did not require so much fish food, the shark was indispensable for the purpose of keeping down the too rapid multiplication of smaller fishes. Those days have passed, so far at least as the waters of the Jersey coast, and those immediately adjacent are concerned, and the time has come when in self-defence a vigorous raid should be made upon these voracious monsters.

A. M. S.

THE DHOLE OF INDIA.

THE Dhole is of slighter make than the dingo, but like the latter, he possesses erect ears; pointed muzzle, and a sparkling fearless eye. His chest is deep, and belly much drawn up; the color is generally of a light brown, inclining to chestnut on the upper part of the body, fore part of the legs, tips of the ears, muzzle and upper part of the tail, which appendage is long, but not bushy, like that of the Australian animal; and were it not for the slenderness of the muzzle, and erect ears, he would bear a close resemblance to the African bloodhound. According to Colonel Sykes, the wild dog of the Deccan, (*Canis Dukkunensis*, "kholsun" of the natives), is red on the upper part of the body, but paler underneath; its head is compressed and elongated, its nose very sharp and the eyes oblique, the pupils around the irides light brown; the expression that of a coarse, ill-natured Persian greyhound, without any resemblance to the wolf, the fox, or the jackal, and, in consequence, utterly distinct from the *Canis quao*, or *Sumatrensis* of Hardwicke; ears rather long, but erect, and slightly rounded at the top; the limbs remarkably large and muscular compared with the bulk of the animal, which is of an intermediate size between the wolf and the jackal. Its neck and body are elongated, between the nose and eyes the color is red; brown, and the brush, which is pendulous, and about nine inches long, is tipped with black. The length of the body from the tip of the nose to the root of the tail is about two feet nine inches, and the height at the shoulder about sixteen and a half inches. Another variety of the Dhole is the wild dog of Nepaul. Although the Dholes or wild dogs of India, according to various authorities, differ in some minor respects, they all, both ancient and modern, appear to agree on one important point, that of excessive fierceness, which characterizes all varieties. Like the dingo they hunt in packs, and, thus associated, are very formidable, and, in fact, are the terror of the animals of the forest, not even excepting the elephant and tiger. They hunt in silence, and as their powers of scent are as exquisite as those of a sleuthound, there is little possibility of their missing the game they are in search for. When close upon and certain of their prey, they utter a sharp, shrill, clear cry which can be heard from a long distance, by others of their kind which understand the meaning of the sound, and hasten in vast numbers from all directions to join the already formidable pack. Their speed is tremendous, almost incredible, and their powers of endurance very great. Their pace, when in hot pursuit, is said to be nearly equal to that which a pack of ferocious greyhounds might be supposed capable of exerting; and as their wonderful staying powers permit them to continue this speed for an almost incredible time, it may be readily perceived that the chances of any animal they may chose to pursue are very meagre indeed; in fact, if they are strong in numbers, not even the swiftest and most powerful of the denizens of the forest and jungle can possibly evade them, and the size, ferocity, and power of the tiger stand him in no better need in saving his life than does the deer's swiftness of foot, when a pack of these canine demons chose to select either for their prey. Indeed the larger the game they are in pursuit of, the greater eagerness do they display, and the natives assert that both the elephant and the tiger manifest unmistakable signs of fear, and seem to have an instinctive dread of such terrible enemies. The Dholes do not run closely together, but spread themselves over a wide tract of ground, so that their prey has little chance of escape by doubling, or any similar expedient; but should their numbers not be great, this circumstance is favorable to the escape of large animals, so that when their game is a tiger most of them are destroyed; but on the contrary, should they be in force, although forty or fifty of the foremost may be crumpled up by the powerful paws of the prey, the quarry is, however, soon overpowered when the main body of the pack closes in. Richardson considers them eminently useful in India for keeping down the breed of tigers, "which but for them would be far more numerous and troublesome." Doubtless, however, the scarcity of the tigers in districts where Dholes are numerous is more fairly attributed to their continually worrying the great striped feline, and preventing it from obtaining any prey, as they are most destructive to the game which forms the principal food of the former.—*Land and Water.*

For Forest and Stream.

THE FALSE FEJEE.

ONCE I loved a Fejee maiden,
Kee-wah-nee-wah-ya-hoo-hay,
 "The Ever-blooming Forest Flower"—
 She translated it that way—
 Though it might mean "Speckled Cow," or
 "Striped Bug," or "Whiskey Sour,"
 For aught that I can truly say.

She was young and not ungraceful,
 And had rigid raven hair,
 Which, with wonderful precision,
 Fell across her forehead square;
 And the angle of her vision
 Gave a look of indecision
 To her orb's uncertain glare.

Golden amber was the hue on
Kee-wah-nee and-so-forth's cheek,
 Golden amber, haply varied
 By a sanguinary streak
 Of red earth that had been "carried
 Over," as it were, or tarried
 From the toilet of last week.

How we joined the chase together,
 In the forest, in the dell;
 How the grasshopper we followed,
 With our spirit stirring yell;
 How in banquetting we wallowed,
 As the spoils of chase we followed,
 It were bootless here to tell.

'Tis enough that I was happy
 In that primitive retreat,
 And when dark forebodings filled me,
 And the camp was out of meat,
 Even then the proud thought thrilled me,
 "When her people shall have killed me,
She will find me good to eat."

Fool, to hug the idle fancy!
 Ah, that anguish-laden day,
 When a bark from o'er the ocean
 Bore a stranger to our bay—
 A stranger with Quixotic notion,
 That the savage, at his motion,
 Would abandon prey for pray.

He was young, and plump, and rosy;
 I, alas, was dry and spare,
 And *Kee-wah-nee* was all a woman,
 Fickle as the summer air.
 I was more or less than human,
 With my dearly bought acumen,
 Had I tarried longer there.

Good ship, bear me quickly onward!
 South sea simoons, kindly blow!
 Wafting from that tropic Aiden,
 Balm for all my bitter woe:
 For with barbecue 'tis laden,
 And I know the faithless maiden
 Now is lurching off my foe!

J. J. ROCHE.

X ELK HUNTING IN NEBRASKA.

TO the sportsman, as well as to the enthusiast in the beauties of nature—and what true sportsman is not the latter as well—the country west of the Missouri river presents attractions of the most inviting description. The broad plains of Nebraska, Kansas, Wyoming and Colorado, the lofty peaks of the Rocky Mountains, and the rugged Sierras of California offer the former every inducement in the shape of "fur, fin, and feather," while to the lover of natural scenery they unfold a panorama unequalled for grandeur and varied beauty by anything in the world. The locality to which I desire to call your attention presents, however, little to attract those who cross the Plains simply as sight-seers. But to the votaries of rifle and shot-gun it is a very paradise. Fifty miles to the southward flows the Republican river, the banks of which are still the feeding ground of countless numbers of buffaloes and the hunting ground of the brave Pawnee, the treacherous Sioux, and many other smaller tribes of Indians. Fifty miles to the northward lies the Loup Fork, once the undisputed home of the Pawnee, and now a sort of debatable ground between their Reservation and that of their deadly enemies, the Sioux. On the banks of this river browses the mighty Elk, (*Cervus canadensis*). A little further to the west among the sand hills feed the watchful antelope. Beaver and otter are in every stream. The open prairie furnishes chickens (*Cupidonia cupido*), sharp tailed grouse (*Pediocetes phasianellus*), and upland plover (*Acticurus bartonianus*), while the river bottoms teem with quail (*ortyx virginianus*), and occasionally we find a drove of wild turkeys (*Meleagris gallinavo*), deer, both black tail (*C. columbianus*) and Virginia, (*C. virginianus*) abound both in the rivers and along the creeks. In short, whether you carry your rifle or shot-gun, or both, you will find work enough to do. Starting at a point on the Central Pacific Railroad, about one hundred and fifty miles west of Omaha, a party of three, we pulled out on the afternoon of the last day of August, on a march toward the Loup. A bad Indian country is that along the Loup Fork, for upon its banks lies the trail which the Sioux follow on their horse-stealing expeditions to the Pawnee village. We were not without apprehensions that we might encounter some small band who would try to run off our horses; but we wanted game more than we feared the Indians, and therefore we decided to take the risk.

Jack Robinson, our teamster, an excellent and amusing fellow, sat in the wagon containing our provisions and bedding, behind his rattling team of sorrels, that trotted along at a pace that promised well for a speedy arrival at the hunt-

ing ground. Lute—my guide, philosopher, and friend, ah, how shall I describe you? what fitting words can I find to convey an idea of your genial spirit, your kind heart and generous disposition? We are old friends, Lute and I; together we have hunted buffalo on the Republican, and antelope on the sand hills; have shot wild turkeys on the Beaver, and been chased by a rascally band of Minne-coujas, between that stream and the Republican, and now we are going to hunt elk on the Loup.

He has said to me: "I can promise to give you, at least, a shot at the elk, but don't know whether you'll kill or not. They're pretty good game. Not many men around here can say that they've killed an elk. My spirits fall at this, for I have dreamed of elk for weeks and fear a miss.

We traveled about twenty miles the first day and camped on a small creek where we found wood and water. A little fried bacon, some biscuits hastily cooked, and a cup of coffee constituted our first meal in camp, and after smoking a quiet pipe we lie down by the fire. Lute's last observation is, "We'll have game to-morrow night, boys." My heart gives a throb, and I secretly pray that I may be the one to kill it.

We started with the sun the next morning and had a long day's march. Lute and myself hunted through the ravines, while the wagon kept on the divide. We saw no game except three deer, which jumped up about seventy-five yards from Lute. Shooting from his horse he touched one of them in the hind leg, but not seriously, as we watched it for a long distance and though it fell behind the others it kept up a gait we knew would carry it away from our ponies, fast though they were.

We had traveled all day, and were hot and tired when we came to a creek where there was good camping ground. The sun was only about two hours above the western horizon, and we decided to camp as soon as a place could be found where we could get the horses down to the water. In looking for such a place Lute rode toward the top of a little ridge to get a wider view. Suddenly I saw him bend down over the neck of his horse and wheeling round gallop toward us. "There they are, boys," he cried, "elk, about twenty of them." In a moment we were all excitement, and were hastily following his hurried directions. The horses were unhitched and unsaddled, and picketed out. Fire arms and knives were examined, and we descended into the bed of the creek, whence the elk had just emerged about half a mile further up. But who can describe the labor of our advance on that band of elk? Not I, indeed I can only say that the bed of the creek was full of water and very miry, that the sides were nearly perpendicular, and were almost everywhere covered with a thick growth of nettles, briars, and creeping plants; where bare they were wet and very slippery; that the sun was blazing down as only a Nebraska sun can blaze, and that we ran ahead when we could, and fell ahead when we couldn't run. Fortunately there was no wind; I say fortunately, for the elk's sense of smell is so acute, that it is more to be feared by the hunter than its powers of vision.

At last we were within three hundred yards of the place where the game was supposed to be, and it behooved us to move cautiously. Lute carefully ascended the bank and looked about him. For a long time he gave no sign, but at length I saw him lower his head and creep rapidly toward us. "They are moving," he whispered, "feeding along toward the bluffs; we must hurry." As fast as possible we hastened up the creek, and soon, after another look by our leader, turned up a ravine. The utmost caution was now necessary. We crawled along, not on our hands and knees, but flat on our faces for some distance. Lute first, myself next and Jack last. Presently we turned and commenced to ascend the side of the ravine, and as we neared the ridge Lute stopped and motioned me up beside him. "They're just over the ridge, crawl up and take the first shot." I feebly resisted, but he reiterated the order, and I complied. On reaching the top I cautiously raised my head, and there within a hundred yards of me I saw the ears of an old cow elk. The sight was almost too much for me, and I sank back a moment. Then steadying my nerves by a violent effort, I raised my old Sharpe. Carefully with finger on trigger, I full-cocked it, and sighted where Lute had told me to, about eight inches behind the fore shoulder and low down. For a moment I could not hold well on her, for the flies troubled her and she kept moving, but at last she stood still and I pulled. The smoke hid her from me, and I sprang forward just as Lute ran by me, to get a shot at the herd as they fled. In a moment I was at his side, and we stopped just about where my cow had stood when I fired. The elk were running briskly off about half a mile away; none of them seemed to be wounded, and I could see nothing of the one at which I had fired. At that moment I felt particularly small. Suddenly Lute shouted, "There she is," and following the direction of his glance, I saw a movement in the short prairie grass. We rushed to the spot, and there lay the cow, kicking in her death agony. My ball had passed through her heart, and she had run about fifty yards before falling. That was for me the supreme moment. As I stood over her, all the trouble and annoyance of the trip; all the worries and cares of every day life were forgotten, and I was absorbed in the proud contemplation of the graceful creature lying before me.

Lute was cordial in his congratulations. "I knew that you hit her," he said, "for I crawled up behind you and saw that you held steady as a rock."

After bleeding and butchering our game we started for camp. It was now almost dark, for it had taken us quite two hours to reach the place where we then were. Strik-

ing off over the prairie we arrived at our camp in about fifteen minutes, and after a delightful supper spent an hour or two talking over the incidents of the day, and listening to Lute's stories of hunts and Indian fights.

'Twere a pleasant task to narrate to you a score of his tales. To tell you of battles with the Sioux on the Missouri, and with the Arrapahoes in Kansas; of how Frank, Lute's brother, killed Tall Bull on the Loup, and how, on another occasion, with one white men and seven Pawnees he fought for five hours against one hundred and fifty Sioux under old Turkey Leg, and finally drove them off. But lack of space forbids, and I must hasten to the end of my tale.

Early next morning we were afoot, and before night the flesh of the elk, neatly stripped from the bones, was in process of being jerked. For five days we hunted with most satisfactory results. Elk were found and killed on several occasions. Finally, forced to it by "the terror by night," viz., mosquitoes, we turned our faces homeward. On the last day but one of our return march we camped early and rode out to take a last look for game. As we descended the slope of a high bluff Lute's eye, which was constantly roving along the horizon, caught sight of some moving objects just appearing over the top of another bluff a few hundred yards off. Crouching low in our saddles we galloped down into the ravine, and, leaving our horses, ascended the next ridge, whence the elk could be seen feeding slowly toward us. We had only to wait until they came within shot. Very deliberately they advanced. The leaders, two fine bulls, stopping every now and then to look, smell, or listen, and then boldly stepping forward, as if to encourage the more timid females and young. Had we waited I am confident that they would have come up within ten yards of us. It would have been little else than murder, however, to have shot them so near, and I was glad to see Lute look round at us and signal us to be ready, while they were still more than a hundred yards distant. The three rifles cracked almost simultaneously, but to our chagrin only one animal fell. It was Lute's bull. Jack and I had fired too hastily, and had missed. As the herd swept round the hill, in full flight, we fired again, but with no better result. A third shot from Jack as they were ascending the bluffs brought down a large bull, and as they were about to disappear I raised my two hundred and fifty yard sight and carefully fired at a large cow which ran a little behind the other. As I lowered my rifle I saw her stagger, and then, turning off to one side, move down a ravine on three legs. Running back to the horses I sprang into the saddle and urged forward my pony with whip and spur. I was soon within sight of the cow, which, although on three legs, ran very fast, and I had ridden nearly two miles before I got close enough to shoot from the saddle with any certainty of killing. At last, however, I fired while on a run and brought her down, but it took another shot to finish her. It was an exciting chase, and I did not realize until I passed over the ground on my return what a mad gallop it had been. I had ridden through sloughs so miry that on reaching them again I was fain to pick out a better crossing; had descended on a full run the sides of cañons so steep that I now preferred leading my horse up to riding him, and had given the little animal such a breather as would have thoroughly exhausted an American horse.

We had now plenty of work on hand. The heads and skins were prepared for mounting, the meat jerked, and with a wagon heavily loaded we started for the railroad.

Thus ended my hunt of 1873. Successful and eminently satisfactory in all respects, I can only hope for as pleasant a one next year.

ORNIS.

THE GRASSHOPPERS' FLIGHT.

THERE would be no earthly joy in a grasshopper's life did he not trust in Providence. Last fall the weary mothers came over the mountains and began laying their eggs in the grass. But it rained and hailed, and thousands of birds went out to gather them up. Then great fires swept over the plains, and when cold weather came the grasshopper could hardly find a place to cast his horoscope. There is not a woman in Colorado who would have been willing to trust her offspring to the mercy of a Rocky Mountain winter. But the grasshopper was full of faith, and when the final hour came she folded her fragile wings and sank into the dust of the wilderness. The winds blew and the storm howled, and it did seem as though all grasshopper life would perish from the earth. But after a while, when spring came and the grass peeped up from the earth, myriads of little specks began hopping about, and many doubted if they were really grasshopper babies. They looked like little grains of black tea, and nothing could be more helpless and insignificant. A child could kill a million of them. Wagons and horses and remorseless boots trampled them into the earth. Still they grew and increased and multiplied, and in a few weeks strong men trembled, for their crops were disappearing before the silent mowers. There was no relief, and for once man and his inventions had found their master. A long sweeping train left the depot with the speed of a racehorse, but an army of these little insects mounted the rails, and the power that tunnels mountains and defies the ocean storms became as helpless as a babe. For a time it was thought that the crops would be entirely ruined, and to tell the truth many were. The weak little fly of earth formed his second wings—with his first ones he could not move any distance—and away he went towards the clouds. Billions and sextillions of them filled the air; in fact the entire space between the earth and the sun seemed literally alive with them, and from the shady side of a house one could see miles of them upon miles among the clouds, with the sun glittering down through their transparent wings. They were no longer despised insects of earth, but having waited patiently for their ascension robes they were free at last, joyously winging their way to other climes.—Greeley (Col.) Tribune.

GROUSE HUNTING IN GRASS.

LAWRENCE, KANSAS, September 18, 1873.

EDITOR OF FOREST AND STREAM:—

IT has been only a short time since we (of the Winkle Club) were first delighted by the clear, handsome, heathly look of the FOREST AND STREAM, and it has filled to our perfect satisfaction a long felt want, *i. e.*, a paper devoted to "the true, beautiful and good," in field sports, and entirely free from the "professional" taint which so wofully infects the horsey journals of the day.

As the season for shooting Grouse (*vulgo*, prairie chickens) over dogs, is rapidly drawing to a close, some of your Eastern readers may be interested in knowing what we have for sport in Kansas; so with your permission, I will give the result of two day's shooting of our club, named in honor of that devoted and illustrious sportsman, Nathaniel Winkle, Esq. Fortunately we have as a leading member, Major E. of the L. L. & G. R. R., a prince of good fellows, who has at his command a car fitted up with berths, and all that is necessary for the comfort of man and dog, by day or night, which is often kindly placed at the disposal of the club. As you may imagine, nothing can exceed the comfort of this style of going shooting; at least so eight of us thought as we rattled away from the station here on the night of August 20th, armed and provisioned as the law directs. In fact, as an English friend who was one of the party said, "it was awful jolly," the only drawback being the thought that we had but three good dogs, the rest being young and out for the first time.

With the good company and our anticipations for the morrow, it was impossible to sleep, so smoke and song and story kept us up till after 12 o'clock, when to give our nerves a little chance, we turned in. At three the sleepy ones were routed out with the cry, "time to get up, nearly there," and in a few minutes we stopped and were switched on a siding at Colony Station, sixty-eight miles south of Lawrence, in the midst of a splendid expanse of prairie, with here and there a small stream, along which an occasional farm affords the birds a stubble field as a rallying point. The Major had telegraphed ahead and we found wagons and breakfast in readiness; the latter was soon dispatched, and just as the first faint blush of morning tinted the sky, we were off.

Ah! the beauty of that morning! the soft, fresh breeze, the miles and miles of beautiful waving grass, covering the rolling swells of the prairie, with here and there a faint blue line of smoke curling up from the chimneys of the scattered farm houses. Every breath of air pure and sweet, and the heart full of thankfulness for so beautiful a world. But soon our first stubble is reached, and quickly both men and dogs are out, and hardly have they entered the field, before the old dogs are drawing and standing. Away go the birds, the old cocks leading with a whirr and a rush that startles the novice and quickens the blood of the oldest veteran. As the stubble is quite bare of cover, it takes only a few shots to send all the birds out to the grass, and pairing off, we follow them up and the day's work begins. Every moment the sharp report and the floating feathers tell of the death of some brave old cock, or tender youngster, whose life leaves him in the air. How bravely sometimes the old fellows will wheel and swing across, and when we miss we can not help shouting "well done, good bird."

By nine o'clock we begin to feel a little tired, and the hot sun is telling on all of us; so we quit and rattling back to the Station, a rush is made for the car and the claret punches suffer. Wiping out the guns, resting and dinner take up the time till four o'clock, when we are again ready for the fray and shoot till dark.

All the many incidents and accidents, things wise and otherwise, I can only leave to the imagination; suffice it to say, thus did the Winkles on the morning and evening of the first day, likewise the second, when the bag was counted; and notwithstanding the greenness of the young dogs, we had 326 birds, which as we were in the field only about nine hours each day, was not bad. On the 5th September, four of us went in the same way to the same ground, and bagged 138.

Just after writing the above I read your "stave" on "Grouse Shooting" in No. 5, and beg leave to notice one or two points. In the first place *all* of your friends "out West" don't say "chickens" when they mean Grouse, and if constant prodding will do any good, the number of those who do, will diminish every season.

You speak of the birds "getting up quickly," "flying in a straight line over the tops of the scrub oaks," &c., and also that there is no use for a dog. Well, that may be the way in what you call "scrub oak prairie," but as our Teutonic friend says, "we don't got no" scrub oak prairie here, and I am glad of it, because in our prairie grass an old cock will nine times in ten give you a twenty-five or thirty yards rise and go off as if he had been kicked. Now I don't mean to say that they are hard to kill, in comparison with several other varieties of game, but if anybody, in September or October, "drives out an empty wagon at daylight" without a dog, and don't come back till he fills it, I advise him to learn to whistle, "Do they miss me at home" just for recreation.

As to charges, I find in a No. 12 Powell that 3½ drs. powder and 1½ oz. shot, No. 7, will do the work nicely.

Our quail shooting begins October 1st legally, but practically not till November 1st, as many of the birds are not full grown and strong till then. In quail shooting, Kansas can in my opinion "lead all the rest." I have shot them in Virginia, Maryland, and Missouri, and have never seen as good shooting as we have, and if you are not too much bored by this I may write you what the Winkles do on quail. Very truly yours, H.

Woodland, Lawn and Garden.

BULBS AND THEIR USES.

THE HYACINTH.

"Who splashed with red the sumach hedge—
The sassafras with purple stain;
Gave ivy leaves a ruby edge,
And painted all their stems again.

"Discolored every hazel copse,
And stricken all the pasture lands,
Flung veils across the mountain tops.
And bound their feet with yellow bands.

"Is this September come so soon?
Full time doth summer ne'er abide?
While yet it seems but summer's noon
We're floating down the autumn tide."

—Atlantic Monthly.

FIFTY years ago, but little attention was paid to the culture of the bulb family, compared to what there is at the present day. Scarcely any one thought much of planting in the fall of the year, the beautiful Hyacinth, and if they could obtain a tolerable good bloom of this flower in the spring, with much care, they were amply satisfied with their efforts.* Now, the case is entirely changed, and a steadily increasing interest in the culture of this flower has been one of the studies, as well as amusements, of the amateur gardener and true lover of flowers. Our lady friend was right, when she exclaimed, "Are not these beautiful?" They were so, most emphatically, and the production of twenty Hyacinths, in full bloom, of the different colors and most choice varieties, as far back as the year 1837, was an achievement in floriculture not often witnessed, when you consider the little practical knowledge then possessed, compared with the present high state of cultivation and knowledge of "how to plant and cultivate the Hyacinth of to-day." These bulbs were planted in the October of 1837, on a mellow, Indian summer day, when the warm rays of the declining sun made genial and beautiful all the landscape around. Our lady friend was one of those few persons, in those days, who made good use of her eyes and ears, and had a keen appreciation of the beautiful, as revealed in the adornment and decoration of this "flower-mosaic'd earth." Success, if deemed within the possible, did not deter her from undertaking what necessarily involved care and watchfulness, and was to her a new field of labor; but she entered with a good will to her work of planting bulbs, and she says, in a letter to us: "My fall planting of the Hyacinth resulted in a perfect success. I shall try the old, never-die-out Dutch tulips next fall, and will give you an account of my failure, or success, for I am one of the few that believe it to be honorable, as well as pleasant, for ladies to know how to grow plants and flowers." From this period she was a most skillful and successful flower culturist, and has given to the world many interesting facts, as the result of her persevering efforts to *cultivate well a few flowers*.

Every one at all acquainted with the Pestalozian system of education, taught many years ago, will recollect the sentence written over the school-room door of Mr. Venable's academy: "What man has done, man may do." So, at the request of our lady friends, we place before them this article upon the "Fall Planting of Bulbs." Not that we do not well know that, to many of them, we are only telling an old story over again, yet, unlike the writing upon the rocks,† we say a few words to them, and hope to cheer and encourage them to persevere in their search after the knowledge of the hidden beautiful.

Beautiful indeed, on a bright and balmy morning of spring, is a walk in our garden, among the flowers, the birds, and not least our newly blooming Hyacinths, tulips, and their numberless companions. Glorious spring has unsealed their petals; their opening leaves utter to our ears no audible sound; we hear not their silent voice, as they rise in speechless worship of the Maker of the Universe. But we behold in them a silent epic of beauty, all glowing in their peculiar and diversified loveliness.

But, to the practical portion of our bulb plants, we will append a few suggestions, gathered from a long and patient study, as well as practical experience, of the treatment necessary to ensure a good bloom of the Hyacinth and other bulbs. Whatever is worth doing at all is worth well doing. The preparation of the ground plot, the particular place in the garden or on the lawn, is the first consideration our lady gardeners should notice. Having secured this—always making their selections in such locations as shall give them full sunlight—for the Hyacinth loves not the shade, and will droop its head and yield only a weak, sickly, green abortion, unless cared for and carefully treated) you will study the character of the natural size of the plant, you now propose to cultivate. "How did this splendid old purple bulb, which I now hold in my hand, grow in its nursery in Holland? Of what was its earth-bed composed?" This is the first question you are to answer in your practical attempt to make a bed for your bulbs. Having thus decided that an abundance of sun and air are *indispensable* requisites to success; also, your bed should not

*We well recollect the triumphant exclamation of a lady thirty years ago, upon her having succeeded well in raising good blooms from bulbs of the Hyacinth, planted in the fall. "My friends told me my bulbs would all freeze to death during the winter. Have they done so? No indeed. Are not these beautiful?"

†"Writing upon the rocks," a reference to that public desecration of all good taste that defaces, with wretched quack notices and advertisements of worthless nostrums, all along our river's banks; which enters all our parks and public places of resort, and may even be found at our church doors. It is time this nuisance was suppressed. Will not the FOREST AND STREAM "give these violators of lost good sense and good taste a lash from the old whip?"

be in too dry a location. The family of bulbs, all of them, require a certain amount of moisture, and must have it. The soil generally is not of a quality or condition to receive these bulbs without preparation; therefore, we must make an artificial soil for them. This can easily be done with care, a good, well-drained bed being the chief requisite to success. This bed should contain twenty-five to thirty inches of a good prepared soil, and, as before remarked, be *well drained*; without good bottom drainage it is impossible to raise good flowers.

The manner in which we generally make our beds for bulbs, and we think it a very good way indeed, is as follows, viz.: We dig our pit, as we term it, of the size and shape we fancy for our bulbs. First we remove one spitting of the black loam, or top soil, placing the same in a handy position near by; then we next remove from the first all the yellow loam, stones, sand, and gravels of any kind, until we have made our pit the full depth we require. This being done, the nature of the soil revealed by this process determines, in a manner, your future treatment. If you strike at the bottom of the pit, an uncongenial, stiff, cold, clay, you require a very good drainage. Some gardeners recommend in this case going from six to eight inches deeper, and filling up with stones, &c., for drainage. (I think their reasoning good.) By so doing you are easily relieved of all superfluous water. We have, with good effect, made a sort of pavement, leaving crevices for the passage of water between, and in some very wet locations can recommend the same as one of the best kinds of drainage for the Hyacinth, tulip, and other bulbs.

The soil for this bed should be composed of equal parts of loam, or leaf mould (leaf mould from the woods) clean sand, and old, well rotted cow manure, no matter how old, if well soaked and pulverized; or the soil, in lieu of this, may be taken from an old, spent, disused hot-bed. This latter is, by some skillful culturists, preferred to cow manure, as it is made ready to their hands. One word as to sand: This should be a clear, free grit, and a little coarse; sea sand will do, but the saltiness should be washed out, or soaked and dried well before using, as salt is sometimes too strong for this use. Bulbs generally are very impatient of salt.

You will now replace again in your pit the soil or black loam first removed from the same, and fill up to within six or seven inches of the surface; now place your prepared soil upon the same and fill up, say four inches above the original surface of the ground, and nicely round up the same.

Now you can plant your bulbs, as your taste may suggest in belt lines around your plot, according to the ribbon or belt style, being careful to study the harmonious effect of color in the arrangement of the same. You can, if you prefer, set three plants of the Hyacinth in groups—a red, blue, and white. The effect is quite pleasing, and you can make this still more effective, by planting three whites, three blues, and three reds in just the same relationship to each other as the single bulb arrangement. Various forms will quite naturally suggest themselves to any lady of good taste. In the same bed with Hyacinths may be planted low tulips, to fill up the spaces, but, to our own mind, we admire the stately Hyacinth in all its pride and beauty. We do not consider it in accordance with good taste to mix in these plots different varieties of bulbs.

In planting your bulbs you can, with safety, place them out in open beds and grounds as late as the last of October, or, in fact, to a later date in the fall, with good success.

I once planted out some twenty-five bulbs of Hyacinths and two dozen large tulips on the 20th of November, when I had to break the crust off the ground with a bar. They were in as fine condition and bloom the next season as those set in the month of October.

When planting the Hyacinth in October, we advise planting the bulbs about four inches below the surface of the ground, and we have found our account in using a transplanting trowel, making a clean hole and placing firmly the bulb, and then filling up the hole with sand. In the spring the bulbs came up straight, and we have found fewer decayed or rotten bulbs with this process than by any other.

A bulb bed, made according to the above direction, will last, without disturbing or removing the bulbs, for several years and give good flowers, particularly the tulip; but we prefer to remove the bulbs after flowering, as we have an idea that we get better flowers from re-planting. The half-hardy varieties should always be taken up on the first sight frost. These may be re-planted in the spring and will give a good strong flower.

One of our best bulb culturists, Mr. Rand, says: "Grow the foliage weak;" and our own experience has been, our best flowers to replant are those whose leaves have perfected themselves in the most thorough manner. Select for your fall planting those bulbs only that show the most vigorous ripened leaves, and the bulbs should be set in October—any time during the month. About the first of December, if not before, your bulb bed should be covered to the depth of three or four inches with coarse straw litter from the stable, to prevent freezing.

The Hyacinth, tulip, and many other bulbs grow in the winter months, and if you would behold a fine exhibition of one of the great laws of nature take a Hyacinth bulb and cut the same open in the middle in mid-winter, and examine it with a powerful microscope, and you will see the perfect flower, imbedded deep down in the bulb. With a very fine glass you may even see the colors of the bulb. If the weather in the spring is not too cold, the covering should be removed from the bulb, and after its removal, if you fear a cold, frosty night, it would be well to cover

your bed with an old coverlid or bit of sail cloth. The bed may now be dressed, or fertilized, with the usual dressings, and the flowers will soon make their appearance.

But few, if any insects trouble these bulbs in the spring, and if so, they quit possession after one application of a weak solution of warm soap and water.

OLLIPOD QUILL.

ORNAMENTAL AND FOREST TREES FOR FARMS.

THERE is much said in the agricultural papers of the day concerning the planting of ornamental and shade trees at the West. Various States have set apart "arbor days," when every man and boy shall feel it his duty to transplant one or more trees, and some States are so wise as to offer a reward to the person who shall set out the largest number of forest trees on that day. Now there is as great a scarcity of shade trees upon many farms at the East as at the West, and the purpose of this article is to call attention to the fact, and persuade youthful farmers to supply the deficiency, and to transplant the maple, oak, elm, and other trees this season, which will afford a grateful shade for years to come.

I heartily commend those farmers who plant new orchards of apples, pears, cherries, plums, and peaches. The fruit is delicious, highly appreciated at home and abroad, and will bring in plenty of "material aid" in the shape of greenbacks. But fruit trees are not desirable about the house, and can never take the place of forest trees for adornment, timber or fuel; nor are they as desirable for a "cool, umbrageous shade."

Cattle seek grateful shelter from the noon-day sun, and it is as essential for their comfort to obtain it as it is for man's—as needful for their health. But do not plant the trees too close to your dwelling-houses and barns; give the air a free circulation about such buildings. Oaks, maples, and elms should not droop their branches over the roof-tops, but be planted at least thirty or forty feet distant.

In selecting trees to plant around the home farm, it is always well to choose those which are useful as well as ornamental. The sugar maples are quite as handsome as oaks and elms, while from thirty or forty good-sized trees, several pounds of delicious syrup can be obtained. I know a man who planted in his yard ten sugar maples, some twenty or thirty years ago, and now obtains about three gallons of maple syrup every spring. Thus we can combine utility and beauty. The American weeping elm is as perfect a tree as grows, and the oak is always majestic, while the white and black ash and silver maple are also much admired.

While I am on this subject, let me beg your readers to plant trees outside of lawns and front yards, as well as within the fences, and have the pleasure of providing a shady highway and sidewalk for every passer-by. There is nothing which adds more beauty to a street than rows of forest trees. Evergreens are most desirable for windbreaks, screens, and ornamental purposes upon a lawn, but are not so well adapted to the front door yards. They are excellent shields from the north wind, however, and in single trees or in clusters, are especially beautiful on large lawns.

Almost all farmers can go into the forests and obtain as many trees as they require, merely for the cost of digging and transplanting them. If they choose maples, elms, oaks or ash, they will be surer of success if they select those that are from eight to ten feet high; their top branches should be shortened, and many of them cut entirely away, leaving the stems nearly bare, but taking care to lift a large ball of earth and all the little rootlets possible.

In planting them prepare a hole larger than the base of the tree, and deeper than the roots; pour one or two pails of water into the hole, and set the tree in firmly and straight. Stamp down the soil around the roots closely, and then turn the uplifted sods, bottom upwards around the base of the tree.

To transplant chestnut, hickory, and white oak, select small trees, not over five or six feet high, and leave the poles nearly bare of branches or leaves; also cut the main stem in for half a foot. This severe pruning has the effect of producing more root growth, and saves the life of many trees.

When new trees are planted, it is well to mulch them about the roots and stems with coarse stable litter or hay; and if planted where cattle will be liable to rub against them, a strong stake will afford much protection.—*Country Gentleman*.

ESTIMATES OF TIMBER.—A tract of 2,400 acres of pine land, located in Lapeer county, was sold by parties in the Saginaw Valley, two years ago, for \$72,000, estimated to contain 40,000,000 feet of logs. The purchasers erected a mill on the tract and commenced cutting. After making very careful estimates they found it would yield 80,000,000 feet, and have sold the undivided one-half of the tract for \$72,000, the price paid originally for the whole. A Saginaw City also sold about two years ago, a tract of 640 acres, located on the line of the J. L. and S. R. R.R., for \$2,800, which was said to contain 3,000,000 feet of logs. The purchasers looked over the tract carefully and found that it would produce 5,500,000 feet, and one year after sold it for \$9,000. The present owners claim it will yield 8,000,000 feet, and its actual value they fix at \$20,000.—*Lumberman's Gazette*.

OLD ENGLISH VINEYARDS.—Old charters, the bygone names of half-forgotten vineyards belonging to monastic houses, prove that the cultivation of the grape, even up to the Roman wall at the banks of Tweed, was once by far more frequent than it now is. England was probably the most northerly of those countries in which vines were growing at the time of the great millenary jubilee, and that they flourished at all, is proof how resolute were the monks to drink what the difficulties of land transport debarred to those who lived to remote from the coast. London and Bristol, Boston and Norwich, could pick and choose between the amber Rhine and the crimson nectar from Garonne, but a long stretch of dry land was a serious impediment to the carriage of so bulky an article of commerce.—*All the Year Round*.

—Why are sheep the most unfortunate of animals? Because they gambol in their youth, frequent the turf, are often black-legs, and are universally fleeced.

Natural History.

THE PAPER NAUTILUS, OR ARGONAUT.

WRITERS upon Natural History, from the earliest times, including Cuvier, represented the Argonaut as having the power of propelling itself upon the surface of a smooth sea, by means of its tentacles, which it used for oars, and certain expanded membranes for sails; and the legend ran that the ancients learned navigation from this mollusk. So the poet says:—

"Learn of the little Nautilus to sail

Spread the thin oar, and catch the driving gale."

Modern writers, however, declare this to be a fable. Now this is not a matter to be decided by theories, but by evidence. The early writers, Pliny, Aristotle, Alian, and others, who lived near the Mediterranean, where the animal is common, certainly had a better opportunity of studying its habits than closet naturalists in England and the United States, who never saw the creature alive.

Having myself seen the Argonaut sailing on the surface in a calm, in the Indian ocean, and that so near to the ship that there could be no doubt of the fact, I was induced to ask an old ship master who had sailed these tropical seas all his life, if he had ever seen it, at the same time showing him the shell of the creature. "Fifty times," was his reply. But there is better evidence than this.

Some forty years ago, Madame Power, in Messina, where the Nautilus is numerous, made a series of observations upon the habits of these animals, which she kept in cages sunk in the sea. Her object was to determine whether the shell was secreted by the animal, or whether it was a parasite occupying the shell of another species, as believed by some naturalists. In 1839, Madame Porrer sent to Professor Owen, of London, the results of her observations, and the Professor gave it as his opinion before the Zoological Society, that Madame Power had established the fact that the Argonaut was the maker of the shell.

Madame Power states also, as the result of her observations, that the Argonaut uses two of its arms as masts, on which it spreads out membranes which act as sails. These sails, she says, are so large that when turned backwards, and pressed against the shell they can entirely cover and protect it. Thus, she concludes that the true office of the sails is keeping themselves applied to the shell at all times in reserve for the moment when the animal, coming to the surface of the water, raises them as sails. She also says that the Argonaut uses the long funnel or proboscis as a helm to steer its course, and projects it from the stern or wide part of the shell for that purpose.

Now, as we find the statements of the early writers confirmed by the authority of Baron Cuvier, and this accurate and systematic observer Madame Power, as well as by voyagers, who profess to have witnessed these sailor-like habits on the ocean, it seems time that they are to be believed, rather than the theorists, however numerous, who, because they have not seen these things, deny their existence.

S. C. CLARKE.

DO SNAKES SWALLOW THEIR YOUNG?

MUSEUM, WESLEYAN UNIVERSITY, September 19th.

EDITOR OF FOREST AND STREAM:—

Affirmative evidence on this question is rapidly accumulating. Twenty-two additional cases have been brought to my notice since the meeting of the American Association for the Advancement of Science, making in all one hundred and sixteen. M. Palisot de Beauvois, an eminent French naturalist, saw seven young rattlesnakes, each as thick as a goose quill, run down the parent's throat; he hid behind a tree and soon saw them reappear; he advanced, when they a second time disappeared, and the parent escaped with the precious burden among the underbrush. This statement, published in 1802, seems to have been overlooked by those who have written on the subject. It is very desirable to ascertain whether the male snake ever protects the young in this way, also to determine whether the ordinary black snake ever swallows its young. I am inclined to believe that all the supposed cases relate to the mountain blacksnake, (*Coluber alleghaniensis*), which has a prominent ridge along the middle of each scale, while the ordinary blacksnake, (*Basiliscus constrictor*) has scales round and smooth.

G. BROWN GOODE.

THE LAPLANDER.—The proverbial low stature attributed to the Laplander is a mistake. Some of them may be found under-sized, and frightfully ugly, but a Laplander only four feet high is a rarity. Quite to the contrary, the nomadic Laplander is most frequently found six feet tall. I have met Laplanders over six feet tall, who would pass anywhere for magnificent specimens of humanity. Generally their eyes are of coal black, piercing in character, their hair is not always black, as I have often seen flaxen haired individuals among them. Their complexion is invariably dark, and they have prominent cheek bones, small nose, rather flat, and the forehead is more broad than high. The men are mostly thin and spare, the women, however, incline to corpulency. Formerly brandy was the bane of the Laplander, but the Swedish Government have curtailed its use among them. They are tremendous tobacco smokers, and with a pipe in their mouths, will drink strong coffee from morning to night.

A. DULK, (AUSLAND).

—The *Moniteur de l'Algérie* states that, in 1871, the coral fishery employed 131 boats. In 1872, there were 80 more boats. Improved methods of fishing have, however, given equally good results, when compared with those of former years; in fact, there has been an increase in quantity of coral put on the market. New beds of coral have been found near Sardinia, which have drawn many of the Algerian fishermen to the Northern Mediterranean.

WHISKEY vs. CROFOLINE.—In the *Germantown Telegraph* there is an interesting letter from a Mr. N. R. Morley, of Cimarron, New Mexico, in regard to rattlesnakes, and the methods of curing persons bitten by them. Some one, we think, very foolishly has started the temperance question, in this connection, to which the New Mexico gentleman replies most comprehensively:

"My own experience has been with whiskey as a remedy, and, while I do not dispute the efficacy of other stimulants, at the same time I did not advocate them. I have known persons to die from snake bites, but they were invariably cases where the wound was given near some of the larger veins, and where whiskey could not be obtained in reasonable time.

Animals bitten about the head are apt to die in a very short time; but bitten in a fleshy part not so, and in many cases get well without remedy. I think the effect of this poison is in some way to change the nature of the blood, probably by coagulation or thickening, while the effect of whiskey is just the reverse. Be that as it may, any amount of controversy will scarcely prevent people in rattlesnake countries from using whiskey as an antidote."

Perhaps the most comprehensive paper ever written on this subject of rattlesnakes, as to their anatomy, where the poison was secreted, the construction of the fangs, how the venom was ejected, was the production of a Philadelphia physician, published some fifteen years ago by the Smithsonian Institute. The advice we have to give is to use whiskey invariably, and in good strong doses, and to apply a ligature.

A DUEL BETWEEN HUMMING BIRDS.—A gentleman of Kingston, in this State, recently witnessed a novel battle in a garden of that place. Two green-backed humming birds were the combatants, and the fray lasted seventeen minutes. The tiny antagonists would dart on each other most viciously; would soar twenty feet or more in the air, and then return to the flowers in the beds for a moment, where the warfare raged most bitterly. Occasionally the larger would pin the smaller to the ground, when the latter would strike vigorously at the throat of its foe. Finally the larger bird apparently became very much enraged and made an energetic spurt. The other fell to the ground, its wings fluttered, the body quivered, one quick gasp, and the ruby-throated little one was dead. The victor flew to a dead twig on a neighboring shrub, smoothed its ruffled plumage as a dove would, and twisted its neck from side to side, then for a moment hovering over the lifeless body of its enemy, as if to be certain life was extinct, it flew swiftly away.

FELINE AGILITY.—Burt G. Wilder sends to the *American Naturalist* the following statement of the distance leaped by a cat, which he received from the Sanford Brothers, of Ithaca, N. Y., whom he styles accurate observers of the animals. They write: "When our cat was about a year old, he was seen on several days to take position upon a show case four feet high, and to watch a canary bird in a cage hanging from the ceiling, eight feet from the case; the ceiling was eleven feet from the floor, and the cage an ordinary cylindrical one. One day, as we were observing him thus engaged, he suddenly sprang at the cage and caught his claws upon it; his weight swung the cage up against the ceiling, spilling all the vessels and terrifying the canary. After swinging to and fro several times, the cat dropped to the floor uninjured. We measured the distance from the top of the case to the cage and found it to be ten feet; so that the cat made an ascent of six feet in eight, or upon an incline of nearly thirty-five degrees."

—The London *Times* sharply controverts the assertion made by Dr. Edward Smith to the British Association that fish is rather a relish than food, and contains little more nutriment than water. As opposed to this statement, the investigations of M. Payen are cited, who proves that the flesh of fish on the average does not contain more water than fresh beef, and has as much solid substance as the latter. For instance the flesh of salmon contains 75.70 per cent. of water, and 24.296 per cent. solid substances, while beef (muscled) contains 75.88 per cent. water, and 24.12 per cent. solid substances. The flesh of herring contains still less water than that of salmon, and even the fish are as rich in nitrogenous substances as the best wheat flour, weight for weight.

INTEMPERATE BEES.—Much care is needed on the part of those who handle lavender, against being stung by bees which remain attached to the flowers. The temperance, industry, and providence of these insects are proverbial; yet their behavior in lavender-fields, especially towards the end of the season, when the flowers are fully developed, cannot be too severely reprobated. So careless are they of the good reputation they have earned, that they refuse to leave their lucious feast even when it is laid on the trimming bench; and hundreds are thrown into the still, notwithstanding the efforts to dislodge them, in a state of helpless intoxication.—*Chambers' Journal*.

Animals donated to Central Park during the month of September:—

One Marmoset—Mrs. V. E. Wetmore, Fordham, N. Y.
Ten painted Turtles—Richard E. Kunze, M.D., 606 Third avenue.

Two Horned Toads—E. P. De Mott, 29 W. 29th st.
Two Canada Geese, One Chinese Goose—Steinway & Son, 52d st. and 4th avenue.

One Pea Fowl—George Bing, Rochester, N. Y.
One small Alligator—Mrs. Hazard, 120 W. 45th st.

Two Green Herons—Master Ed. W. Davis, 226 E. 81st st.
One Blue and Yellow Macaw—David H. Flork, 244 W. 11th street.

One Vervet Monkey—C. E. Hunter, 400 Bowery.
One Mexican Squirrel—Master D. C. Wylie, 110 E. 39th st.
No animals have been purchased.

S. H. WALES, President.

—A will of the late Mrs. Ben. Holladay, of White Plains, dated in 1871, has just been presented for probate in the Surrogate's office, by S. L. M. Barlow. Surrogate Coffin has received notice that there is another will, and that there will be a contest. Mrs. Holladay's estate is immense. She owned 12,000 acres of land near White Plains. Twenty buffaloes, several antelopes, numerous wolves, elks, deer, and other zoological curiosities are among her personal effects.

The Kennel.

THE RETRIEVER.—There are two species—the water and the land retriever. The water retriever is, or ought to be, a cross between the smaller kind of Newfoundland dog—sometimes called the Labrador dog—and the setter. This dog is especially useful to the sportsman when shooting wild fowl, through creeks, bayons, &c., and saves him an infinite deal of trouble, and is by no means in the way. Many sportsmen imagine that this dog will scare wild fowl, but his actions teach us just the contrary, as his careful training, natural instinct, and color act as a decoy rather than otherwise. A good water retriever is, however, seldom to be met with, and should be taught when quite young. Nothing answers this purpose better than shooting divers or any young duck, then sending the retriever in the water, and, after he has got his bird, call him to you, take the bird gently out of his mouth, caress and pat him. In three or four lessons, if the water be not too cold, you will find there will be no necessity of even telling him to fetch, as instinct and his natural fondness for the water will be all that is necessary to make a thorough retriever of him. The great drawback, however, is that he must be kept in almost constant practice, and should be carefully broken from rats, which abound on the banks of rivers and lakes. The writer some time ago owned a famous retriever, and was shooting black duck on a lake in Ulster County. It was impossible to approach this sheet of water nearer than twelve yards, as the lake was surrounded by a waving morass. I had been shooting from early dawn with little success, when a large flock of black duck, headed by a drake, came up on the wind, and killing five out of the flock, they struck the water about thirty yards from the shore. The retriever, the instant he saw the ducks fall, jumped in, scrambled through the morass, and swam up to the birds, taking hold of the drake, and was bringing the bird ashore, when he found it was impossible for him to get through the morass with this heavy bird. The dog evidently became frightened, and began splashing and pawing to gain a foot-hold. The writer now became uneasy lest he should lose his dog, but the faithful brute never let go the drake. Running back some distance to a fence, he procured four poles, and pitching one as far as possible, by good fortune landed it just on the edge of the water; then laid another down lengthwise, and another and another, until he made a kind of plank road for the dog, who brought eventually the ducks one by one over this wooden causeway.

THE LAND RETRIEVER.—The best cross for this purpose is a setter, with a springer or cocker spaniel. If your setter has never been taught to retrieve, a more valuable dog than the land retriever it is hardly possible to possess, especially when shooting woodcock and English snipe in the fall of the year. A gentleman wrote to us asking: "How am I to teach my puppy to retrieve?" We answered him: "Have patience." The most successful manner to teach a young dog, especially when teething, is to lay hold of a handkerchief or towel, or a bunch of feathers tied to a cord, and drag it towards him. A slight resistance aggravates him, and makes him fond of possession, which he should be allowed to have for a few seconds; this makes him proud and pleased. He must be warned by a gentle pull at the cord that he is not master yet of it, and this renews his desire, which ultimately becomes confirmed. After a few lessons given with patience, you may take the retriever out in the field, but not after game, as he requires the same lessons in the field as he does in the house. When the retriever will bring anything to you in the *shape* of a bird, rabbit, &c., you can then allow him to go at large, keeping him always at the heel of the shooter, and only allow him to retrieve at the words "Seek, seek," if the birds are wounded, or "Fetch it," if dead. The retriever should always be made to bring the game to the foot, or even to the hand of the shooter, and not lay it down at a distance, as he sometimes lays it down on the wrong side of a fence. Never teach a land retriever to fetch stones or sticks; if he does, he will inevitably become hard-mouthed and irretrievably ruined.

Now that we are on the subject of retrieving, we might bring to notice the head of the race of retrievers; we refer to the large and handsome animal, the Newfoundland. The pure breed of this animal is very scarce, and is not of that gigantic size which it is generally supposed to be, but, when crossed with the mastiff, becomes a most formidable and ferocious animal when aroused. The stories of the faithfulness and attachment to mankind of this truly sagacious dog are known to every man, woman and child throughout the civilized world; but we will relate one anecdote that lately occurred to a gentleman at Newport, R. I. Being fond of reading, this gentleman took his accustomed book and sun umbrella to the sea shore. On one occasion he was so deeply buried in his book that he overstayed his time, and being called to his senses by a glance at his watch, hastily pocketed his book and made for home with his best speed. Just as he had arrived at the house he found that he had left his sun umbrella on the beach where he had been sitting, and as it was mounted very handsomely and a present from his son who is in China, he valued it extremely, and would have sent his dog for it had not the animal chosen to accompany a friend in a short walk. However, the dog soon arrived; his master explained his loss to the animal and begged him to find the lost umbrella. Just as he completed his instructions to the dog, dinner was announced, and he was obliged to take his seat at the table. Soon afterwards, a great uproar was heard in the hall; sounds of

pushing, and scuffling, and angry voices; presently the servants gave way, and in rushed the Newfoundland dog, bearing in his mouth the missing umbrella. He would not permit any hand but his master's to take it from his mouth, and it was his resistance to the attempts of the servants to take the umbrella from him that had led to the skirmish.

The Marquis de l'Aigle, at Francport, near Compiègne, had a large kennel of fox hounds, and in consequence of madness having showed itself among the hounds, he gave orders to destroy the whole pack. A veterinary surgeon was called in and administered strychnine to ninety. The pecuniary loss the marquis suffered was nearly 20,000 francs.

FIDO IN PARIS.—All over Europe the love of dogs among all sexes is remarkable, although they are made to work in Switzerland and some parts of Germany. Here in Paris it is quite common to see a mother dragging her almost infant child by the hand, weary and fretful, and carrying a dog in her arms, which she will occasionally stop to kiss, or dispose of so as to make it more comfortable. This trait is peculiar to no one class, but all seem to have a strong affection for the dog. To see a lady at her door or window without a lap dog is almost a novelty, whilst many of them carry in their arms or lead them by a ribbon in the streets. The corners are posted with hand-bills of hospitals for dogs, where the best medical attendance can be had, and dog medicines and dog soaps are placarded in all directions. On the boulevards, at night, the dealers in dogs are constantly perambulating with two or three pups in their arms, and ladies will stop and bargain for them on the public thoroughfare. They teach them all manner of tricks, and they are valued according to the education they have received and the intelligence they display. When they travel they take a nurse with them to attend to the wants and comforts of the dog, and these nurses can be seen in the public squares airing and exercising the dogs and leading them by ribbons. Some idea of the extent of this dog mania may be judged from the fact that the dog tax paid into the City Treasury last year was 420,000 francs, or nearly \$100,000. The men also have their dogs, but not to such a great extent as females. They are most beautiful little animals, as white as snow, and are kept scrupulously clean, more care being evidently bestowed on them in this respect than many of the children receive from their mothers.

TOWNSVILLE, Granville Co., N. C.

The challenge of Messrs. Suit, Marshall & Cross to the huntmen of the United States, to run their fox-hounds against any pack in this country or England, has been noted by me. I will wager any amount, not exceeding \$100,000, that my fox-hounds are better hunters, and superior in speed, power, and endurance to theirs, and I am ready to run them any time between now and the first of January, 1874, at any place within one hundred miles of Washington City. Should a match be made I will deposit the money, or its equivalent, with the Merchants' and Planters' Bank, Richmond, Va.

R. G. SNEED.

—AN EPIGRAM.—"Henry M****, born Dec. 16, 1805; died ——. He was a great turkey hunter, and a tolerably good fiddler. He desired the above to be placed on this slab. Peace be to his ashes."

The Magazines.

METHOD OF FEEDING AND AERATING THE BRIGHTON AQUARIUM.—By means of pipes the salt water is drawn by pumps from the sea into reservoirs beneath the corridors, and thence raised to the several tanks, as may be required. To effect these important supplies, steam-power is employed; the engine being placed in the apartment not ordinarily shown to visitors. Steam-power is also employed to force fresh air into the tanks sufficient for maintaining the vital quality of the water. We therefore in walking along the front of the tank, observe streams of air-bubbles rising through the water, and disappearing on the surface. As the ocean needs no artificial aeration, one, at first sight, is at a loss to understand why the salt water should be so treated. The explanation involves a recollection of many natural phenomena. The ocean is wholesomely agitated by the winds; the wild tumultuous waves are so many incorporators of fresh air; so are showers of rain; and so likewise are the various currents which conflict and flow in different directions; the very storms which sometimes occasion the most appalling disasters, being wisely ordained to prevent stagnation and secure a store of air for the multifarious fishes which inhabit the deep. Certain tanks are filled with fresh water, suitable for fishes from lakes and rivers, and the aeration for them is similarly conducted. Much skill is shown in regulating the admission of light from above, according to the natural requirements of the animals. Care is also taken to add such constituents as may be demanded for food or shell-building, as for example, shells of oysters, crawfish, and lobsters. The sea being in most part charged with the seeds and germs of marine plants, a crop of them is certain to spring up. The growth of such plants in aquaria is managed by an adjustment of the light, for while a brilliant glare of sunshine would be destructive of certain forms of marine vegetation, too little light would be injuriously prolific, and impair the healthy existence of the animals. We mention all this, to show what a variety of considerations, some of them of a costly nature, have to be kept in view in maintaining a properly constituted public aquarium.—*Chambers' Journal*.

DIFFERENCE IN WEIGHTS.—Does a sportsman's full bag or basket ever feel heavy? For the sensation of the strap over the shoulder is, doubtless, very different from what it would have been if, instead of beautiful trout, one has a twelve pound cannon shot in the basket. Indeed, this notion of weight, though absolute and positive, as marked by the scales of material philosophers, has got a variable force and signification, when sentiment lends vigor to the muscles. For what sportsman, helping to carry home a fine buck, or what loving husband, taking a sick wife up stairs in his arms, or what young fellow, on whose back fortune had, for the moment, buckled a laughing lass of a hundred and forty pounds, to be carried over a slough, would feel the weight the same as if the burden were a bag of grain or a sack of salt?—*The Laurences*.

A MODERN TURKISH STORY.—Once, in Samarkand, there was a tailor, who stole ten yards of cloth from a customer, and in default of returning it, was condemned by the Juagito to lose his right hand. Just as, in the saddest mood, he was placing his bared wrist on the executioner's block, there passed by a charitable person, who obtained his pardon. The tailor returned joyfully to his shop, swearing to sin no more. Next morning, as he sat at his work surrounded by some friends, the benefactor passed. "Ah," said he, "how does that right hand of yours get along? all right I hope? By the Prophet, you ought to be obliged to me." The tailor muttered a few words of thanks, but thought to himself how disagreeable it was on the part of the philanthropist to mention the facts bearing on his particular case, especially before so many witnesses. The next day the same thing occurred, and the day afterwards. At last it became such an annoyance that at last the unfortunate tailor, one day in desperation, baring his arm, with his other hand presented a knife to the philanthropic man, exclaiming, "Here, now for God's sake cut off my hand, for once, and have done with it. I would prefer that a thousand times, rather than to have you always talking of how you saved it." Moral: When you have performed a good action, cease talking about it.—*Translated from Tour du Monde*.

HOW CLUBS ARE STARTED IN ENGLAND.—A new club, as often as not, is originally evolved from the moral consciousness of a gentleman about town who has nothing to do—say a half-pay officer—half-pay officers without private fortunes are capable of anything. He finds a solicitor who knows somebody who has a site, or, it may be, a ready house built. An architect is probably required, and he is sure to turn up punctually. A wine merchant is certain not to be far off; and an upholsterer, you may sure is faithfully to the fore. All these people use their connection to get a nucleus of members; you may be sure that they all get something more than their professional emoluments, and the club commences its career with a cheerful debt; Entrance fees and subscriptions of course come in, but these are found insufficient for the purpose. Then there is a whip round; then a hundred or two of rather mixed members are taken in without entrance fee, then there is another whip; then more touting for additional members, and so the game goes on. Sometimes a club tides over its troubles and becomes safely established, but the majority of new speculations of the kind go to the wall after a year or two. There are a set of men going about—of sufficient ostensible position to bear description in a list of names—who belong, I really believe, to every new club that starts.—*All the Year Round*.

Answers To Correspondents.

[We shall endeavor in this department to impart and hope to receive such information as may be of service to amateur and professional sportsmen. We will cheerfully answer all reasonable questions that fall within the scope of this paper, designating localities for good hunting, fishing, and trapping, and giving advice and instructions as to outfits, implements, routes, distances, seasons, expenses, remedies, traits, species, governing rules, etc. All branches of the sportsman's craft will receive attention. Anonymous communications not noticed.]

OARSMAN.—Nine boat clubs on the Harlem river, foot of 133d street.

GLOAN.—1. Whitehall county. 2. Clinton county. 3. Number ten bore.

INFRA DIG.—The best thing to harden the soles of your pointer's feet is to sleep them occasionally in rock salt and water.

GERMAN, Philadelphia.—Have known a Brant to be killed at fully seventy yards with a muzzle loader.

RAT.—Sewing machine oil, very good for barrel, but we use the best watchmaker's oil for gun-locks, and never any thing else.

R. A.—We could recommend Hart, of Northport, L. I. He is a good trainer, and handles the dogs himself.

AMAN, American Jockey Club.—Fordham rides 8 st. 10 lbs., (122 lbs.) When he follows the hounds he will weigh up to 140 pounds.

L. S.—Taxidermists use tow for stuffing; bran would make your small specimen look puffy and unnatural.

GOVERNOR, Morristown, N. J.—Perhaps the difficulty with your gun is that it is too short in the stock for you. E. H. Madison, of Brooklyn, will lengthen it for you.

QUARL.—Your shooting is good, but would not pass muster with the Association, because the minimum pull on the trigger must be six pounds.

MRS. H.—The cat-bird can be made quite a pet. We have known them to be tame, and to show a wonderful degree of sagacity. Audubon declares it to be a sweet singer.

GEORGE, Brooklyn.—The St. Louis United Eleven lost only two matches during their extensive trip North. We think as cricketers they promise to be a very strong eleven. Ten of them are Englishmen.

S. H.—A male and female mink would be worth \$50. They may be caught in a box trap. They become quite tame. They are positively bred for profit in the United States and Canada.

LAMBERT.—Relations between length of wing and rapidity of flight in birds have been studied. Birds remarkable for rapid or long-sustained flight have large wings. There is a difference between sustained flight and rapidity of flight. Would like to hear more from you.

G. A. M., Rochester.—Commence teaching your dog in a room just as soon as he shows any sense or instinct. Regular work in the field may commence as early as seven months. Be patient, but let him know you are his master.

LANTOR, Madison, Wisconsin.—The London gunmaker you name we do not know. His guns do not come to this market. From the price, we do not think they would suit you. Second hands may be good; they are often quite serviceable. They are browned and burnished to so as to look like new guns.

QUANDARY.—Books vary as to the distance the sounds you want to know about travel. A musket on a still day may be heard three miles quite distinctly, but the human voice with the wind blowing may be heard as far. On the contrary, with a wind adverse and blowing only moderately, a musket cannot be heard above 800 yards. Atmospheric conditions govern.

L. F., Flemington, N. J.—Your favor has been overlooked. Hope you will excuse. At Porter's Lake, Pike county, Pennsylvania, there is some deer shooting, and fair bass and pickerel fishing—about the same as you describe in your letter. Tolerably well wooded. You should go earlier than July for trout, which are abundant in some parts of the Bushkill. Black squirrels abundant only in Michigan; grey squirrels in northern Pennsylvania. See previous numbers of this paper for localities, as well as for numerous hunting districts, within "a day's journey" of your town. No law restricting squirrel hunting. Culexifuge and ordinary preparations of little protection against flies and mosquitoes. Use tar and sweet oil—one part to four. There is nothing better cleaner.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

—AT—

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, OCT. 2, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

This paper sent gratuitously to all contributors.

Advertisements should be sent in by Saturday of each week, if possible.

CHARLES HALLOCK,

Managing Editor.

Calendar of Events for the Current Week.

FRIDAY, October 3.—Single Scull Race, Dendee Lake, Paterson, New Jersey. Dexter Park Club, Chicago, Illinois. Deerfoot Park, Parkville, L. I. New York Yacht Squadron's fall Regatta. Southern Pueblo Fair, Colorado.

SATURDAY, October 4.—New York Yacht Squadron's races. Fall games Athletic Club, foot of 130th street, Harlem. Boat Clubs, foot of 134th street, Harlem. Jerome Park races.

MONDAY, October 6.—Missouri Fair, St. Louis, Missouri. Oregon Fair, Salem. New York Yacht Squadron's match.

TUESDAY, October 7.—Eastern Dutchess Association, Armenia, New York. Pittsburg Driving Park, Penn. St. Louis Fair Association, Missouri. National Amateur Regatta, Philadelphia. Watertown River Association, Watertown, New York. New York Yacht Squadron's match. North Carolina Central Fair, Henderson, N. C. North Carolina Western Fair, Salisbury, N. C. Eastern Tennessee Fair, Knoxville, Tenn. Virginia and North Carolina Fair, Norfolk, Va.

WEDNESDAY, October 8.—Brooklyn Yacht Club regatta. Yates County Fair, Dundee Union, N. Y. Eastern Dutchess Association, Armenia, N. Y. Pittsburg Driving Park. Jerome Park races. Watertown River Association, Watertown, N. Y.

THURSDAY, October 9.—New York Yacht Squadron's races. Chillicothe Horse Fair, Ohio. Pittsburg Driving Park, Penn. St. Louis State Fair, Missouri. Watertown River Association, Watertown, New York. Eastern Dutchess Association, Armenia, N. Y.

ACKNOWLEDGEMENT.

WE can make no more becoming use of our columns than to express through them our keenest appreciation of the encouragement and assurances of success which we daily receive by every mail, and especially of the valuable contributions that have been furnished for publication by many eminent sportsmen and naturalists, and by other gentlemen of high culture and position, who aver that they have never before written for papers that might be classified with sporting journals. This voluntary and earnest support is the best guaranty that the FOREST AND STREAM must presently attain that high standard of excellence and character which it aspires to, and which the respectability and critical judgment of the country demand. This paper is not simply an emanation from the office at which it is published, but it is in reality a compendium of information and thought contributed by the three score of intelligent writers whose services and sympathy it has already enlisted. There need be no apprehension, therefore, of its ultimate ability to secure recognition among the leading literary journals, and a permanent foothold in educated and respectable circles.

Whether it is to be a pecuniary success, is another and serious question. From the circumstances of the case, it must be apparent to all its readers that the class of people among whom it must necessarily circulate is comparatively

limited. Our mail subscribers, with few exceptions, are men of wealth and high social standing. What the character of its support from the news stands is, can only be inferred; but we feel that it is not from the masses.

Now, it is within the ability of the manager of this paper to "run" it indefinitely as a *pastime* upon his own private resources; but this is not generally the motive among journalists, and we submit to our numerous friends, that the "laborer is worthy of his hire," and that to depend upon mere approval as a reward of constant and wearing effort is not altogether encouraging. Good words make indifferent butter for parsnips. So those say who ought to know; and while we are grateful, as we have already said, for words of encouragement, we feel that we are not presumptuous in asking our friends for something more substantial. If each present subscriber will merely jog his neighbor's elbow, our circulation will double in a week; and if gentlemen who are in the habit of comfortably reading the *Club's* paper free of expense at their sumptuous dinners at the refectory, will think it worth while to remit the price of a subscription, we assure them that the bound volume at the end of the year will more than repay the investment as a work of reference.

We are aware that these remarks involve a tacit admission of weakness; yet this weakness is only relative, for our success thus far exceeds the most sanguine expectations and the ordinary experience of journalists. Our expenses are necessarily large at the outset, and our receipts are naturally curtailed by the existing monetary troubles. Nevertheless, we "mean business," and as an earnest of our intention and effort to make the FOREST AND STREAM worthy of the patronage it seeks, we herewith announce with pleasure that we have this week added Prof. Elliott Coues, M. D., of the Smithsonian Institute, to our corps of paid associates, with a proprietary interest in the concern, and that the effect of this valuable acquisition will soon be felt; and if we cannot make an acceptable paper with our present force, we will solicit still more distinguished and valuable aid.

We cannot too strongly express our thanks to the newspaper press throughout the country for their kind and disinterested notices of this journal, and feel happy to have merited such general and unqualified approval.

METAPHYSICS OF DEER HUNTING.

WHEN the financial panic was at its height last week, we visited a wealthy friend whose up-town mansion is palatial, his income from safe and judicious investments always ample and assured, and his bank account invariably showing a balance to his credit of many thousands—a gentleman who dabbles little in speculative risks; and whom cares of State and fluctuations of the market of late do not perplex; one of those rare exceptions among men, content with sufficient and not ambitious for more. Surely, his was a case not, within the range of human probability, to be affected by any financial crash or monetary crisis. And yet, so intricate and searching are the ramifications of disorder in times like these, when even the most provident and conservative find themselves suddenly cramped for means, that he was unable to command a dollar from ordinary or extraordinary resources. Said he: "I have a balance in bank of \$20,000, but all the cash I can raise is a paltry two hundred dollars. It is just enough to take me to the Adirondacks. I am getting my guns and traps together, and to-morrow I start for Paul Smith's, to bury myself in the woods and seek oblivion until the storm is over!" Happy the man who can thus drive dull care away at will, and turn aside the impending wave of trouble! The bank to which he has confided his trusts may break in his absence and swallow all his surplus; the business, hitherto lucrative, in which he is a silent partner, may suspend and cut off his monthly income; dividend paying stocks may depreciate until they are quoted at half their value; bonds and mortgages may cease to be negotiable; still, like the ostrich with his head in the bush he may roam the forest in blissful ignorance of his misfortunes, and follow his quest for game with a blithesome heart and bounding step! Who would not be an ardent sportsman? Such a man as this never allows business to interfere with his shooting. We wish the same were true of the herd of speculators who squeeze values, upset the market, and set the mercantile world at their wits end. Would that some good genius would inspire them to go off for "a day's shooting," and *stay*—until the panic subsides!

Ah! there is some soothing influence in this going apart to commune with nature in her solitudes, that makes us forget the struggles of life and our worldly troubles. It banishes all inordinate desires, simplifies our tastes, and makes us contented with mere food, raiment and shelter, which, after all, constitute the sole necessities of life. This free existence among the woods, with heaven's canopy over us, the crisp and fallen leaves beneath our feet, and the pure untainted air to breathe: it gives us elasticity of step and expands the lungs; it enlarges the generous impulses of man; it dignifies his own self respect; it makes him noble! In this quiet unconcerned existence, he finds himself moving in a new world populous with strange creatures, with whom in time he learns to hold familiar converse. The little denizens of the stumps and hollow logs become accustomed to his presence at last. When the first sound of his coming footfall was heard, they all hid away. The first warning twig that snapped admonished them to be wary and lie perdu. All was silent as the grave, except when a rustling leaf dropped down, or a walnut slipped from its opening shell aloft. But presently the head of a little gopher popped from under a dry leaf, then his body crept stealthily out, and

in a minute with a sharp squeak to show the coast was clear, he rustled away. Then a woodpecker peered cautiously from behind the trunk of a tree, and commenced to hammer, and from a neighboring limb a red squirrel sprung his sharp, shrill rattle. A garter snake glided noiselessly from under a stump and slid into a bog hole, from which an autumn frog already intoned his solemn staccato bass.

As we have said, one learns to comprehend the language of these little creatures, and understanding them thoroughly, wonders how any man can be so unkind and thoughtless as to blow out their little lives with powder and shot. Even the deer begin to understand him at last, and if he is harmless and uses no gun, will repose such confidence in his honor that they will actually bring the rising generation of agile fawns to drink from the very spring that supplies his camp. Then when both have become better acquainted by closer contact, the sportsman will learn to look into their lustrous eyes as lovingly as did Don Juan into Donna Julia's; and all his conscience will rise up against him in reproach for his cruel slaughter in bygone years. His resentment will follow the hunter who dares to lay violent hands upon these innocent creatures whom he has learned to regard as his companions.

If his larder becomes empty, he will have to select another locality where the deer are wild. It is only when they are *running*, that he can make up his mind to shoot. If bucks and does would only walk gently up to the magnanimous hunter when they see him stalking in the distance, they would never get shot. Even the tiger seldom springs upon a creature that is not in motion. This is nature. We are a creation of pursuers and pursued, but not insatiable for that reason, by any means. If one will not run, there can be no pursuit. It is only human beings like the Neros, Herods, and Caligulas that butcher in cold blood. These are the metaphysics of deer hunting. He who has studied the subject thoroughly, will find his thoughts yielding a responsive assent to their truthfulness.

Now is the time for enjoying the full fruition of the delights which a ramble in the forests affords. Whether it be in the eager pursuit of the chase, or in the simpler study of the gorgeous tints of autumn, in breathing the sharp, invigorating frosty air, or in seeking merely a temporary relaxation from business cares, the glorious month of October yields an appreciable reward which no other month affords.

THE PRIZES AT CREEDMOOR.

IN examining the very handsome prize list offered by the National Rifle Association, on the occasion of the coming contest in October at Creedmoor, we are pleased to notice, in one most important way, quite a divergence from the English precedent.

In the last number of FOREST AND STREAM we published an account of the various prizes—one hundred and twenty-five in all—of an aggregate value of \$8,298. The prizes consist of silver plate, cups, badges, medals of gold and silver and bronze, rifles, a Gatlin gun, life membership, &c., and to these are supplemented three money prizes of \$30, of \$25, and of \$20, making \$75 cash in all; an insignificant amount, when compared with the total value of the other prizes.

It is by exactly reducing the money prizes to a minimum that we think that the Rifle Association have shown their good judgment. It is their particular aim, and one in which the Rifle Association will doubtless be sustained by the American public, to give these national rifle matches the least possible appearance of a gambling contest. If men are not satisfied with that honorable distinction which a medal confers, and will only exercise their skill when sharpened by the amount of money they can make, then the true character of such contests, the proper rivalry which should exist, will be most materially damaged. The money question once introduced, must inevitably lower it in tone.

Neither the State, the military organizations, nor the press, which all now unite in welcoming this effort to make rifle shooting a national pastime, would countenance what, if carried to any extreme, would undoubtedly rather give Creedmoor the appearance of a race-course than of a rifle-range. It is most desirable that Creedmoor should never enter into the category of "a sporting place in the worst sense." If at Wimbledon contests have a certain amount of pounds, shillings and pence attached to them, it is no reason why in this country we should blindly follow a bad example. But that this is the universal practice in England is by no means the case; witness the Lord Elcho prize, and the cup given this month in Ireland to rifle men. There may be nothing objectionable in the fact of men making a handicap for some trifling sum among themselves. Should it, however, become an established custom for the Rifle Association to offer certain amounts of money, no matter how large or small they may be, as the leading prizes for American rifle shooting, we believe that this money taint would materially injure Creedmoor.

We learn that Dr. Elliott Coues, U. S. A., Naturalist of the Northern Boundary Survey, has been very successful during the summer's operations in the field, having collected several thousand specimens, dry and alcoholic, in various departments of natural history. Some of the specimens are of great interest, representing rare and little known species, while others, it is believed, will prove entirely new to science. His observations, likewise, appear to have been minute and extended. Dr. Coues is at present at Long Coteau River, just north of the line, 270 miles west of Pembina. He will probably return in October.

PRUSSIAN HORSES.

QUESTIONS of cavalry remounts, considered entirely aside from their military bearing, are interesting, inasmuch as they show us any particular system adopted by a government or people in propagating useful breeds of horses. Though railroads, in a strategical point of view, may be supposed to have somewhat diminished the want for horses used for hauling stores for armies, nevertheless, in the late Prussian and French war, an enormous number of heavy draught horses were employed. Prussia's supremacy in the military art makes these questions of her cavalry remount quite worthy of examination. With a population proper of 21,971,000 inhabitants, she has at present about 2,313,817 horses. Of this quite large number, 381,000 are horses under three years old, and she has no less than 8,817 horses used alone for breeding. The Government has thirteen depots, which cost about \$300,000 to maintain, and horses of three and four years old are purchased by commissions of officers and veterinary surgeons, and sent to these depots. At the various depots they are generally kept for a year, and the horses cost, when laid down, about \$100. Before the horse reaches his regiment he is supposed to be worth \$65 or more. With respect to sex of horses, the sales of mares is by no means encouraged by the commission, so that the proportion of male animals is the greater in actual service. The price of horses during the last twenty-five years has more than doubled; in 1845 a good horse could have been bought for \$65 or \$70.

In 1870, a careful comparison was instituted between the value of the Prussian army remounts and the French horses, and the superior excellence of the German horse, for general work, was quite evident. Prussian horses which went through the fatigues of the campaign, returned in better condition than when they started, and the period of greatest utility proved to be between seven and fourteen years of age. The system of raising horses in Prussia seems, then, to develop the powers of the animal later, which may be due to lighter feeding, or a disinclination to force the horse when too young. The best, staunchest, and most lasting animal was a particular race—a cross between a singularly sturdy animal of Eastern Prussia and the true Arab. As to weight of load carried by the Prussian cavalry horse, it is about the same as in the English service; but there can be no doubt but that the endurance of the Prussian horse considerably exceeds, at present, that of the English steed.

BADEN-BADEN GONE TO THE DOGS.

IF the last breath of the suicide, if the wail of children left starving, if all the curses, deep and loud, which have been showered by fathers, mothers, husbands and wives, on Baden-Baden had been effective, long before to-day this Paradise of gambling would have been consumed like Belshazzar's palace.

But no *denouement*, taken from melodramatic sources, has burnt up the Kursaal, nor have the tables of *rouge* and *noir* sunk into the bowels of the earth. There has come on Baden a wasting away—a kind of moral dry rot. Gambling abolished, Baden is fast dwindling away into insignificance. From 70,000 people, allured by the magic wand of the croupier, drawn in by the *roulette* wheel, now but a sparse 15,000 have visited it. Flown away to more congenial climes, Dukes Benazet and Dupressoir still rope in (we know of no better word) pigeons at Monaco. Possibly next steamer will bring us notice of a feeble shooting match there, under the patronage of a sporting Duke or so, or of some circus-like steeple-chase.

The intrigue, the shame, the scandal, the flaunting vice, the immorality of sometimes almost two continents, will no longer be concentrated there. The Americans are essentially a moral people at home, but when abroad—well, the best thing we can do will be to say as little as we can on this subject.

Doubtless many of our fast men will miss the feverish charm Baden had, and sneer at the furtive attempts made at Saratoga in the same line of business. Who knows but that in a few years we may not, in our progressive age, make Saratoga just such a hell as Baden was. We are fearfully imitative, sometimes too much so for our own good.

All we can wish of Baden is, that in time it may settle down, under its august Duke, to be a quiet, wholesome village, as gay as most German brunnen generally are, only "*alea jacta sunt*," seems in this case to partake rather more of a prophesy, for here by the pitching of dice and by the turn of a card, has all the glory of Baden departed.

THE WASTE OF TIMBER.

A PARAGRAPH floating around states that the Indians upon the Leech Lake Reservation, in Minnesota, have become so enraged at the destruction of timber on their lands that they have taken the war path, and are burning the lumbermen's hay by way of reprisal.

Here is a lesson for the Hon. Joel T. Headley and those very few other gentlemen who deny that cutting away our forests will diminish our water supply, or work out climatic and organic changes that must prove detrimental. Even the untutored savage can appreciate the value of our forests to the extent that, he not only implores that the "woodman spare that tree," but absolutely insists upon it in a way that is neither gentle nor kind. He realizes that the denudation of the earth is extermination to the red man, and that with the deep damnation of the taking off of its timber, food, fuel, shelter, navigable waters, and means of transportation all vanish.

Geology tells us that the mosses and ferns were the first vegetable products that grew upon the surface of the earth, and that, the pines and then the deciduous forest trees succeeded; and after them came animal life. By inversion, it is easy to determine that animal life must perish after the trees are destroyed.

It is the duty of man, by what he owes to his fellows, if not by the universal law of self-preservation, to prevent so sweeping a calamity. And man, when impelled to that sterner mood which horrible conviction brings, will not stop to "argify" the question with the Hon. J. T. Headley, *et al*, but, taking the ounce of prevention in his hands, make the advocates and defenders of timber-cutting "cut stick" in a fashion which will throw all the devices of the Minnesota redskins far in the shade.

PENETRATION OF RIFLE BALLS.

IN the sixth number of FOREST AND STREAM, in an article entitled "Killing a grizzly bear," we mentioned the fact that a number of balls from a sporting Remington rifle had not penetrated, and some of our readers manifested a surprise at the fact. Since writing the article we have seen the balls and have had the matter explained to us by a naturalist who was present at the killing of the bear, and by whose skill the remains of bruin now neatly dressed, will shortly be made presentable at the Smithsonian Museum. He has explained to us, that the ball happened to strike in a peculiar muscle, some four inches in thickness, which he informed us was of the density and elasticity of india-rubber, and assured us that according to his belief, for he is a thorough sportsman, that no balls from any rifle would have penetrated it. On examining the balls in question, we found them very little off shape, and presenting exactly the form which would occur when any projectile fired at a high velocity would meet with resistance from a dense and elastic substance. The gentleman also mentioned that where these balls struck might be considered as chance shots, as the grizzly could be, though not easily killed by a single ball, frequently touched in a vital spot by a ball from a Remington rifle.

In a prior number, when we treated the subject of explosive projectiles and penetration, we stated the many difficulties which surrounded this most interesting subject. In a late number of the London *Field*, we find an admirable article on this subject of penetration, from an able correspondent. Shooting Indian game, the writer says, "I have no hesitation in saying that in rifles I have seen (and many of them are by first-class English gunmakers) the penetration is insufficient. I am well aware that if I use a solid bullet with the Express rifle it will go through anything, and equally so that such penetration is not only undesirable but positively objectionable, as the probability of bagging an animal with such a bullet unless hit in a vital part is very remote indeed." In a case like this the shock on the animal might be immense, but no vital part may be touched, and though the animal is certain to perish, yet he may die miles away from the spot where the shot was received. This same authority when explaining the fact, which all buffalo hunters so well know, that no matter what may be the penetration of a ball through wood, when shooting at an animal, the penetration of the ball is comparatively slight in proportion, replies to it in this way. He is writing about hollow bullets:

"It has been asked why it is that a bullet will penetrate planks and bones, and yet breaks up before going very far into flesh. To explain what I believe is the reason of this difference, I must refer to an old experiment of firing a bullet with a large charge of powder into a tub of water, in which case it has been found that the bullet will not go through the bottom of the tub, whilst the same bullet with a smaller charge goes right through. The explanation is that the particles of water will not part quickly enough to allow the ball with the high velocity to go through them; whilst on the other hand, the ball with less velocity pushes as it were the particles aside, and goes through the bottom of the tub. Now in the case of an animal, the higher the velocity with which the bullet is traveling when it strikes the fleshy part, the quicker it expands, consequently the less it will penetrate; and if the velocity is very great and the walls of the bullet thin, it may fly to pieces when scarcely inside the skin. In case of a bone the velocity in which the ball is traveling is sufficient to break the bone, because the particles cannot move out of the way quickly enough. I believe that this will be found to be a correct solution of the different behavior of bullets when hitting flesh or intestines on the one hand, and bone on the other."

The English system of balls for rifle shooting when used for animals employs a solid and a hollow ball. The great difficulty seems to be to get at one and the same time a low trajectory with crushing power of projectile. This they are endeavoring to accomplish by means of lighter bullets, and of hardened compositions.

OBITUARY.—We have to record the death of Jean Jacques Marie Cyprien Coste, born in Castries, France, in 1807, and who died in Paris last month. To Coste is due the distinguished merit of having elevated oology or embryogeny, from the condition of a vague and inaccurate study to that of a precise and absolute science. The art of pisciculture, so flourishing to-day in the United States, is indebted to Coste for not only its birth, but its development. Coste had not only the theory, which is inseparable with the man of science, but he was fortunate enough to combine with it the power of practical details which made his observations useful to man. Coste it was who first erected the basins in the College de France, the fish nursery of the world, and who stocked the lake and river of the Bois de Boulogne. From what was at first apparently but an experiment, Coste had the immense satisfaction of seeing his

efforts crowned with success, and soon his methods of pisciculture were repeated in many countries. Coste has added unknown wealth to the world. His fame will rest in his works on Comparative Embryogeny.

SCIENCE SLIPSHOD.

THE other day, Mr. Henry Lee, one of the most pleasant contributors to *Land and Water*, wrote the following plain announcement:—"One of the funniest little 'cusses' ever turned out of Nature's workshop, in the shape of a seal, made a bow to the public in the Brighton Aquarium a few days ago."

Now, that most excellent, staid, and trustworthy periodical called *Nature* seems to take serious exceptions to this rather playful way of alluding to the seal; and evidently regards it a flagrant case of *lese majesté*. It brusquely stands up in defence of the infant *Phoca vitulina*, and insists (funny though the seal may be) that he should not be made to "to do duty as the but for a pun and a slang quotation."

Well, why not in this case "*cuss*?" Are we to be restricted from all that is comical and amusing in Nature? Are we to look gravely at a monkey when he apes the man, and ponder gloomily over the wise look of a jackass? Must human nature restrain all its bubbling over, and freeze its running words into solid ice? Shall we write that Jones, our faithful correspondent, killed five brace of *Picus principallis*, and would have had an odd bird if it had not been for a rascally *Pandion Halietus*, who gobbled it up? What a sacrilegious verse that must be which we are forced to give in all its coarseness—

"'Possum up a gum tree!"—

and how much finer and impressive it would have been if rendered, "The *Didelphys Virginiana* betook him to the *Liquidamber*."

The word "*cuss*," used by Mr. Lee, is an Americanism *pur sang*, and in duty bound we must take up the cudgels for it. Webster may ignore it, even Roget may lock it out of his Thesaurus; Grant White may cut it, but it is a sound and lively word. Bret Harte found it, and put this word "*cuss*" in such a charming setting in his "*Luck of Roaring Camp*" that "the darned little cuss" had in itself, when descriptive of the poor child of Cherokee Sal, a most wonderful charm. Perhaps Mr. Henry Lee had just been reading Mr. Harte's charming story, and for one in a million of English readers, must have been able to appreciate it. Applied to this little seal—fatherless, motherless, thrust into the Brighton Aquarium, where lives the horrid Octopus, there was a close resemblance of circumstances between him and the poor Luck who was "the darned little cuss" of the story.

But all jesting aside, there can be no possible harm in using the most familiar terms, if they are adaptable to the descriptiveness of animals. We cannot always employ the stiffer phraseology of learned books in treating of the habits or manners of natural objects. That a scientific nomenclature is of paramount necessity no one will deny. Before, however, we transport people into the higher, loftier range of knowledge, we must make science adapted to the grovelings. It may be pleasant to know that Agassiz has found gasteropods, shineroderus, euryale, ophiuranus, heliasters, and holostomata in quantity, though not one reader in a thousand may know what they mean.

We assert that just such writers as Mr. Frank Buckland and Mr. Henry Lee have done more to popularize the study of natural history, and engender a taste for it among both young and old, than the works produced by perhaps much more staid and philosophic compilers. Both Buffon and Cuvier wrote in this popular vein, and Mr. Darwin's style abounds with examples of this familiar language. The temple of knowledge nowadays may be scaled not alone by those clad in sombre tunics, each fold classically draped, but even by those in their shirt sleeves. If it is rather a period of scientific "free and easy" the world will be all the better for it by and by.

ONLY A TOOTH.—We have before us an alligator's tooth, coming from Okefenokee Swamp, in Florida, which a friend who is a naturalist has presented to us. There it lies, a fearful fang-curved cimeter, sharp as a needle, and fully three inches long. Shall we write sweet verses about it, commencing:

"O crocodilus, dreaded lizard!"

or shall we speculate on the number of creatures this self-same crooked tooth has munched? The question with us is, "What shall we do with it?" We can make a whistle out of it to call our dog with, or even a charm to hang to our *breloque*. But stop! there is a fitness about all things. We know of a friend who has a little child, whose pearly teeth are just emerging from its gums. What better purpose can we put our 'gator's fang to than to clean, file and polish it, until it shines like ivory, and then give it to the child's mother? The little one can use it as a coral to bite on, and between the sweet innocence of the child and the brutal instincts of the hideous reptile the most striking of contrasts will be made. If the Florida State authorities were not bankrupt, perhaps the method employed by the English Government at Malabar might thin out these creatures. The English offer a reward for crocodiles at so much a yard, two shillings being the price of such a measure of alligator. We are fearful, no matter how plethoric the Florida coffers might be, that in a very short time the general Floridian would become immensely rich, and the individual resources of every citizen of that State be beyond the reach of a panic.

News from Abroad.

PLUCKY is your Englishman. He may be a growler, terribly self opinionated, even a trifle of a bully, yet he has a grand reserve of good nature. He may enjoy very little of the peculiar American adaptiveness, but good, true, staunch and reliable is he. If he does brag and bluster, he almost invariably proves that words are not mere sounds, and quickly becomes master of the situation. Your Englishman now hunts the prairie with our own savages, or tracks the jungles with the Indians. Self reliant, and cool, to good judgment he adds the force of solid thews and muscles. If by sheer head work he makes the laws, by his strong arm he enforces them. He joins in all the sports of the world, and the aboriginal man of every clime, proclaims him as their victor.

The fact of the eagerness, the readiness with which Englishmen take to all athletic sports, struck us forcibly, when reading an article in our transatlantic contemporary. This is the story; A party of Englishmen are at Osaka in Japan, and witness a native wrestling match. Commodore Wilkes first gave us some idea of the immense size, weight, and strength of these native wrestlers. The ordinary Japanese are generally undersized; rarely taller than five feet seven inches; though they are squarely built, they are light weights. How long it has taken the Japanese to breed this special species of wrestlers, is not known, but there can be no doubt but the present race of huge creatures who compete in the Japanese P. R., is the result of selection. Sometimes these wrestlers weigh 300 pounds, and have more the appearance of animals than of men. Our Englishmen, on a holiday, saw two or three contests, when one of them, excited by the scene, even itching for a chance to show his prowess, modestly suggested that he would like to try a throw or so. The Japanese received the strangers' challenge with delight. The burly representative of an Oriental race, with his bronzed skin, is pitted against lithe, agile pale, Anglo Saxon. The one is as a mountain, the other as the wild ash which grows on its side. They interlock, they twist, they breathe together. It is the struggle of a boa and a viper. At last over goes the Japanese, and the knack, endurance, and spirit of the Englishman, (in this case it was a Scotchman) wins the day. One no less pleasant feature of the contest, was the good feeling, and evident sympathy the Japanese had for the new comer. Their desire for fair play, in this particular instance, would be worthy of imitation in more civilized communities. Take ten thousand Americans, and find for us a single one, who would have the moral courage to engage in such a contest, or the physical strength necessary to accomplish it?

—Preparatory to the grand outburst of fox-hunting, when from late October until March, covers will be drawn, and the best riders in the world, mounted on the noblest of horses, will scour the country, just now huntsmen and whippers-in are working the hounds on cub-foxes. With infinite skill and patience the dogs are trained. The head huntsman, an artist in his way now, selects, gleans and culls his pack. Their education has received its finishing touch. Dogs may have shown great speed, may have outrun the pack, but it may be a true case of "ambition overleaping itself." Stern are the decrees of fate, custom and the chase. Fox hounds must run evenly; it would never do to have two or three dogs in at the death of the fox and all the rest of the pack trailing after the leaders. There must be a certain uniformity about the pack, and they must all work smoothly together. Learned are our English brethren in dog-ology. They appreciate the noble animal, and pay for him a round price at times. Witness the sale of a pack of otter hounds, (their owner was killed by a rock falling on him in the midst of his sport,) twenty-four otter hounds bringing the goodly sum, of £475.

—The bad weather—constant rainfall—has so far interfered materially with partridge shooting. It seems too that the birds are not entirely free from the same accidents which rendered grouse shooting impossible. Hope is sometimes an admirable stimulant for a sportsman to have in quantity, so our English friends, in despair of grouse, not very certain about even partridges—are falling back on the idea that black-cock later will give them an opportunity of using up their accumulated stock of cartridges. The scarcity of all kinds of game is apparent from the price it brings in the London markets. Young grouse are fetching 12s. per brace, and are scarce, and partridges are worth six shillings. While examining the food supply of England, at this season of the year, game usually taking off the edge of John Bulls appetite, some facts in regard to more solid beef and mutton will doubtless be of interest. In 1872 the total supply of meat was 1,211,209 tons, or about 84 pounds of meat per head. The home supply was 1,006,231 tons, and was made up by the slaughter of 1,750,000 cattle, 10,640,000 sheep, and 4,846,000 pigs, worth the handsome amount of £73,573,015, of foreign imported meat 142,574 tons were used. What capacious stomachs, and splendid digestion English men women and children must have.

VENICE, ITALY, Sept. 1873.

EDITOR OF FOREST AND STREAM:—

Sir: In your first issue of FOREST AND STREAM, (whose richly flowing current has borne full eastward, as above) "Carrier Pigeons" formed a topic, recalling the scene, where, —on the piazza of St. Mark, Venice—those little grey-robed messengers may still be found, fearlessly coming and going amongst the people. A time honored institution are they, tended and revered, embodying the tradition, that in those days when Venice was the seat and centre of the commer-

cial world—her history bearing (as it has been said) "all the thrill and interest of a romance"—in the thirteenth century, Admiral Dandolo, while besieging Candia, received important intelligence from the Island by means of these birds, which he afterwards despatched to Venice with the news of his eventual success. Nesting now in the richly decorated niches of the gorgeous Byzantine cathedral of S. Marks—which all radiant in its gilding and mosaic, presents its imposing facade on the piazza, surmounted by the noble horses in gilt bronze, brought from the Hippodrome at Constantinople,—the descendants of this old lineage multiply, and conscious, as it would seem, of this their Magna Charta, fly down in flocks, startling the new comer as the air becomes suddenly darkened around him, and they drop, impeding his footsteps, while in their gracefully nodding movements as they walk, they peck about the grains of corn which it is their prescriptive right and title to receive, distributed by the Forestieri, into whose hands the little street urchins press the food for a small coin in return.

I have the honor to be yours very truly,
E. H. P.

Sea and River Fishing.

FISH IN SEASON IN OCTOBER.

<p>COAST FISH. Bluefish, Skipjack, Horse Mackerel, Spanish Mackerel, Weakfish, Squetang (Trout),</p>	<p>LAKES. Black Bass, (Heterostichus nigricans) (two species), Pickerel, (Esox reticulatus), Pike perch, (Lucioperca Americana),</p>
<p>BAYS AND ESTUARIES. Striped Bass, Rockfish, (Labrax lineatus).</p>	

A friend, who has just returned from the Jacquet river, New Brunswick, speaks of the stage of water as having been extremely low all through the season. Once, after the river was raised a little by a heavy rain, he struck a number of fine salmon, the largest of which weighed twenty-five pounds. One singular incident occurred while he was in camp near the principal pool. It was twilight, and his canoe had been anchored for the night near the shore, when he was suddenly startled by a commotion and a thrashing close at hand, and on investigating the cause, he discovered that a large salmon had leaped from the water into the canoe, and was making desperate efforts to get back again into its native element. Once it so nearly succeeded, that its body poised upon the gunwale, but fortunately for the angler, it flapped back again into the canoe, and so was captured. It weighed ten pounds.

Here is the latest news from the Umbagog region. Our informant, who left about September 20th, reports the streams very low, and the trout hard to find. Twenty anglers at the Middle Dam averaged, between them, only three or four fish per day, the largest weighing seven pounds. One weighing three and a-half pounds was taken in Sturtevant's pond by a gentleman from Boston.

Walter Brackett, Esq., the celebrated artist, of Boston, was at Upton with his wife.

The fishing in Jamaica Bay has been very good the past week or so, large quantities of bass, weakfish, and kingfish having been taken, as well as a few sheephead—these latter by experts. The outside fishing is good for bluefish. A great number have been taken, chiefly with bait, running from ten to sixteen pounds.

On September 22d, one gentleman took sixty-seven, some of which weighed sixteen pounds.

Off Far Rockaway, Mr. J. H. Batty took five bluefish that weighed seventeen pounds each by scale test, and fares of 100 to 150 fish per boat are not unusual. Those who can avail themselves of this magnificent last run of the season, ought to do so. Go to Bath, Canarsie, Penny Bridge, Brooklyn, or to Jersey City, and hire your yachts.

The largest run of fish occurs in October, as a rule, and the fishing will undoubtedly continue good until the first frost, which will cut the season short. Bluefish always disappear with the first cold snap.

All through Long Island Sound great sport has been enjoyed for three weeks past, at the estuaries and mouths of rivers, in catching the small bluefish or "snappers" with a rod and float. These fish seldom exceed a quarter of a pound in weight, but are so gamey that even veteran anglers hugely enjoy the sport of catching them. They run in "schools" or "shoals," and bite voraciously.

Although the season for fishing is almost at an end, it may be well to print a few additional notes of localities for future reference, for we find, from constant inquiries addressed to this office, that there is a dearth of information among anglers, which we had supposed did not exist. Where, in the name of patience, we ask, have these eager inquirers been in the habit of wetting their lines, outside of the circumscribed limits of their own immediate neighborhood?

In Jefferson county, New York, which, in fact, lies upon the outskirts of the Adirondack region, there are the usual varieties of maskalonge, black bass, pike, pickerel, and salmon trout, and the fishing grounds are most easily reached from Theresa and other points on the Utica and Black River Railroad. Notable among these is the Indian river and adjoining lakes. Comfortable accommodation is afforded for small parties at the summer houses on the lakes. Trolling is almost the only mode of fishing in vogue, and W. D. Chapman, of Theresa, the patentee and manufacturer of various kinds of spinning tackle, does a large business in supplying the fish with "spoon victuals." Angling has been fair the past season, and the fares have been divided between some four score of practitioners. Among

the remarkable weights taken are one maskalonge weighing forty pounds, a black bass of four pounds, a pike of eighteen pounds, and a salmon-trout of twenty-five pounds.

In Stanley's Creek, Smyth county, Virginia, there is good trout fishing easily accessible from Marion, which is a station on the East Tennessee and Virginia Railroad. Black bass are also found, though not abundant, and have been taken weighing six pounds, although the average is perhaps two pounds. By-the-way, we find a uniformity in the size of bass, wherever taken, that is not observed in many other species of fresh water fish. The trout in this section average a half pound apiece, and seldom attain a weight of two pounds. The number is said to have increased of late. Attention has recently been directed to fish culture in this section, and a breeding pond has been established near Marion, at which place there is also an angling club, of which Dr. H. Stevens is president, Jacob Wagner, vice-president, and Dr. E. Haller, secretary.

Within a radius of one hundred miles from East Saginaw, Michigan, there is splendid trout and grayling fishing, the fish in certain localities ranging from one-half to four pounds in weight. Four pounds is an unusual weight for grayling. The largest we ever saw was a little above three pounds. The grayling is a comparatively new addition to the angler's list of game fish, and is thus described in "Hall's Fishing Tourist," the only work on angling that gives a description of the grayling of America:

"It varies in size from eight to fourteen inches in length, and much resembles the sisco. The back is of a dark, gray color, and its sides are covered with fine, whitish, silvery scales, running in well defined lateral lines, and dotted with shining, diminutive black spots a half inch or so apart—especially about the shoulders. It has a very large, square dorsal fin. Its second dorsal is adipose. At three years old it weighs a half pound, and adds a quarter of a pound per annum to its weight, until it attains a weight of three or four pounds. It is in season from May to October. It thrives best in rivers flowing with gentle current, whose beds are composed wholly or in part of sandy gravel or loam. It feeds on minnows, but takes the fly or artificial grasshopper with avidity. In Michigan, it is caught in the Muskegon river, which is as far south as they are caught in any stream that empties into Lake Michigan; in the Manistee, and all the streams to the northward as far up as Mackinaw; in Jordan river, a stream connecting two lakes and emptying into Traverse Bay; in the Au Sable and Au Gros rivers, on the eastern shore of the State; and in the river Hersey, a tributary of the Muskegon. The latter is the most accessible of any of the streams—eleven hours from Detroit, by the Flint and Marquette Railroad, with a good hotel a quarter of a mile from the depot, kept by A. D. Wood, who is himself a thorough sportsman, and well posted. One mile from the hotel fishing begins, and extends along a mile and a half of cleared bank, which gives the angler a fair cast. It is a beautiful stream of clear, spring water, about twenty rods wide. There are no other fish in it but suckers. The Au Sable is the next most accessible stream, and is reached from Bay City by the Mackinaw Railroad.

"The grayling is not quite equal in activity and pluck to the trout; nevertheless, he is a superb game fish, and a great acquisition to the angler's somewhat limited category. It is quite as shy as the trout, fully as critical in his selection of flies, and "contrary" about taking hold at times, although the fish may be rising all around the vicinity."

The best time for fishing is said to be just after the spring freshets, but we notice that June is the month preferred by Michigan anglers. September fishing is also fine. The flesh of the grayling is of a rich, cream color, and most delicious in flavor, whether it be fried, boiled or baked.

We have the following welcome letter from a friend, who speaks highly of the fishing in northern Alabama:

CORLANDT, ALA., September 20th.

EDITOR FOREST AND STREAM:—

As for fish, we have some of the finest that swim. Our game fish are the trout, so-called—in reality a congener of the northern bass, and almost identically the same fish—the land-locked salmon, the pike, and the speckled perch—a fine fish, often weighing several pounds. Our "trout" often weigh from ten to fifteen pounds, though the average is under ten pounds. These fish are usually taken with the minnow for bait, though in Swan and Beaver Lakes, near Decatur, they are taken successfully with the fly, and by "bobbing." Swan and Beaver Lakes are the places most visited by anglers from a distance, being as good as any, and are only one mile from Decatur, where strangers can always find good hotel accommodations. Besides, these lakes are free to all, there being no restrictions to bar any from fishing in them. Next to these the Musell Shoals afford the best fishing. Indeed, to the enthusiastic angler, I do not know if the Shoals do not afford the best sport. The Shoals are fished not only with hook and line, but also with what in common parlance is called a "jig," a three-pronged harpoon, fastened to a long wooden handle. Armed with this weapon, and one end of his canoe filled with blazing pine faggots, the sportsman quietly paddles his way at night through the shallows and shoaly places, until he catches sight of some finny denizen of the water, which he soon transfixes with a dexterous cast of his "jig." If a large and strong fish, there follows a long struggle to land him, and oftentimes the canoe is emptied of all its occupants into the river before victory rewards the fisherman's skill. As Cuffee is nearly always an indispensable assistant in these midnight ventures, no little amusement is afforded on such occasions. The glare of the torchlight, the gleam of African ivory every now and then, when some lucky stroke of good fortune has safely landed a ten pounder in the bottom of the canoe, or the loud guffaws amid the splash and rush of water when "all hands" have been emptied into the stream in a tussle with some larger fish than usual, lend to the occasion enough of incident and grotesque variety to give a zest often denied the angler who has only the reel and his rod to aid him in his sport.

D. B. H.

We frequently receive letters from the Western States, asserting that fly-fishing for black bass is not practiced in that section, trolling being the only mode of taking them. One correspondent, an expert angler, states that he never heard of the fly being used, and did not know that the bass would take a fly. It seems singular to us that gentlemen living in the very midst of the best black bass regions of

the country should be so generally ignorant of this most satisfactory and attractive method of capturing this splendid fish. We would advise them to make the experiment at once, before the season closes, and thereby experience one of the most exhilarating delights of the angle. Use a large gaudy fly. A mixture of scarlet and white is usually the most killing. By-the-way, we remember well the first black bass we ever saw caught. It was in Big Lake, a few miles from St. Anthony, in Minnesota. The fisherman had a huge watling, fresh cut, a heavy line, and half a frog for bait. He waded out through the lily-pads until he could throw clear of them, and then brought down his frog with a splash that made the spray fly. Nevertheless he hooked a large fish almost immediately, and then, with a jerk, threw him over his head up on the bank high and dry, with such force that he was effectually stunned and stiffened forever.

—Here is a suggestion from a correspondent, which is worthy of consideration. We are not aware that any effort has been made in this country or Canada to stock rivers with the sea trout:—

Much attention has been paid of late to the enterprise of stocking our rivers and lakes with new species of fish, and of restocking them with those which have become exhausted, but I do not remember that the sea trout (*salmo canadensis*) has been included in the number. I see no reason, however, why all our rivers, from Eastport to New York, should not be supplied with this delicious fish, at least all those which are suitable for salmon. The same conditions are required—pure, rapid, well aerated water. Like the true salmon, the *salmo canadensis* lives in the ocean, seeking the head waters of rivers in the summer for spawning grounds. On its way up, like the salmon, it rests in the pools, and there takes the fly. Besides this, it frequents the river mouths in June in great schools, affording the finest sport to the fly fisher. In game qualities it is equal to the brook trout, which it surpasses in size, and, as I think, in flavor. The average size of the sea trout is about the same as that of the black bass, that is, from one to two pounds, and specimens of both species sometimes reach the weight of six pounds; but as food the trout is infinitely superior. In fact, it comes next in rank to the salmon as a table fish.

S. C. CLARKE.

Shot Gun and Rifle.

GAME IN SEASON FOR OCTOBER.

Moose, *Alces Malchis*.
Elk or Wapiti, *Cervus Canadensis*.
Rabbits, common Brown and Grey.
Wild Turkey, *Meleagris gallopavo*.
Woodcock, *Scelopax rusticola*.
Ruffed Grouse, *Tetrao umbellus*.
Esquimaux Curlew, *Numenius borealis*.
Plover, *Charadrius*.
Godwit, *Limosina*.
Rails, *Rallus Virginianus*.
Caribou, *Tarandus Rangifer*.
Red Deer, *Capreolus Virginianus*.
Squirrels, Red Black and Gray.
Quail, *Optyx Virginiana*.
Pinnated Grouse, *Tetrao Cupido*.
Curlew, *Numenius Arquaia*.
Sandpipers, *Tringine*.
Willetts,
Reed or Rice Birds, *Dolichonyx orizivon*.

[Under the head of "Game, and Fish in Season" we can only specify in general terms the several varieties, because the laws of States vary so much that were we to attempt to particularize we could do no less than publish those entire sections that relate to the kinds of game in question. This would require a great amount of our space. In designating game we are guided by the laws of nature, upon which all legislation is founded, and our readers would do well to provide themselves with the laws of their respective States for constant reference. Otherwise, our attempts to assist them will only create confusion.]

—The glorious month of October, with its equable temperature, its bracing air, and its absence from annoying insects and noxious reptiles; with its gorgeous autumnal hues, its dreamy atmospheric effects, and the maturing of all things organic to their fullest perfection, belongs especially to the sportsman. It is his heritage. It has been dedicated, appropriated, devoted and set apart to the children of Nimrod; and everything that is beautiful and enchanting in nature invites them to go up and possess the land. The weather is not too cold for camping out; the crisp air has dried and spread out over the earth its covering of leaves, which makes a luxurious couch for even such tenderlings as the "Babes in the Woods." The thin smoke from the campfires rolls upward in spires of intensest blue; the forests are open and captivating to the eye by their subdued, though brilliant garniture; the sun is golden, though not intense; and the very birds and animals one meets seem magnetized by some potent agency to tarry in these realms of *dolce far niente* until the blustering winds compel them to scurry away to the South, or bestow themselves to closer cover in their native woods. In this wonderful month all the furred and feathered tribes are in full condition for the bag and table, and clad in the most splendid attire, inviting admiration by their beauty, and tantalizing the palate by their rich juices and luscious flavors. A casual glance at the game list, which we print at the head of this column, will indicate how lavishly nature has provided for man, where man's civilization has not utterly destroyed and rejected these gifts.

October is, all things considered, the best month for "calling" wild turkeys, although some sportsmen prefer the spring. Now, as all the devices which man employs to allure and ensnare the victims he pursues are but imitations of what nature has given her creatures for specific purposes, it becomes us to inquire and understand the character of these peculiarities and learn why they are bestowed; and by our investigations to determine the periods when game is in season. For instance, the call of the turkey may be either the warning note of the mother to her collective brood, as in the autumn, or the invitation and response of the wooing, as in the spring. At the latter season, all birds are full grown, and the yearlings are in their prime. In October the flocks have not yet scattered; the young turkeys, though large and strong of wing, are not fully grown, and the family circle remains unbroken. In both cases, it is apparent, the birds are noble and legitimate game. A turkey-call is easily imitated by using the hollow bone of the leg or wing of the same, or even by the hollow of the two hands placed together; but these devices can only be learned by careful attention and practice. The early morning is the best time of day for calling, as indeed it is for all manner of hunting.

There are various modes of capturing the wild turkey, which we shall allude to from time to time, giving by-and-by much attention to the turkey hunting of Florida, which is in perfection during the winter months. Will not some of our friends out West send some account of wild turkey hunting for the delectation and information of such of our Eastern friends as have never seen the sheen of a 24-pound gobbler's glittering bronze?

Around Winchester, Va., accessible from the Baltimore and Ohio Railroad, turkeys are abundant; so also in Laclede county, Missouri, ten miles from railroad; and in northern Michigan, which, by the way, is a section which our Eastern sportsmen seem to know nothing about; and yet it is a primitive wilderness which even the lumbermen have not thoroughly traversed.

—Wild fowl of various kinds, especially woodcock and blue-winged teal, are in our market in considerable quantities. October woodcock are in their prime—this year's birds full grown and fat, the cover somewhat thinned of leaves, and the heat of the sun not overpowering as in July and August.

—John Penwarden and a companion, while hunting grouse near Bear Swamp, in Wayne county, Pa., north of Milford, were attacked by a large panther which came out of the swamp. They wounded it, and were obliged to flee for their lives. The animal followed them a long distance. This is the first panther that has been known to infest the woods of that section for many years.

—They have had amusement on the Tobique river, New Brunswick, hunting a Rocky Mountain elk, which escaped from Barnum's menagerie a few days ago. It was several hours before he was discovered, and then it required a force of twenty men to return him to his old quarters. The brute weighed 1,100 pounds. In securing him a Dr. Driscow received severe injuries.

—A large moose, sporting an immense pair of antlers, was run into last week, near Methot's Mills, by a Grand Trunk Railway train, and so severely injured that he was shortly afterwards captured. The day previous three moose were seen in the neighborhood.

—The "Colorado Sportman's Club" has been inaugurated at Denver for the sole purpose of importing quail into the Territory for breeding purposes, a most laudable movement. The following gentlemen are its present officers: C. Gove, President; James Thompson, Secretary; Hyatt Hussey, Treasurer.

—The range of the quail on this continent is greater than that of any other game bird.

—For exploits in the field and valuable local information, we can refer our readers with much satisfaction to our voluminous correspondence, printed elsewhere.

—In Connecticut the National Guard are taking up rifle shooting in good earnest, and have ranges at Meriden and West Haven. It will not be long when ranges will be established in the proximity of every large city in the Union.

TORONTO, September 19th, 1873.

EDITOR FOREST AND STREAM:—

I beg leave to inform you that the city of Toronto can boast of three distinct shooting clubs. The first is "The Toronto Gun Club," exclusively for the shooting with breech-loading guns, the officers of which are:—James Ross, M. D., President; Dr. J. W. Elliott, Vice President; Alexander McGregor, Esq., Secretary and Treasurer.

The second club is the "Junior Gun Club," the officers of which are:—W. H. Coen, President; John James, Vice President; J. W. Deacon, Secretary and Treasurer.

The third is a split or a branch from the Toronto Gun Club, being formed by some dissatisfied members of the first-named club. The following are the officers:—Dr. J. W. Elliott, President; B. Moore, Esq., Vice President; Alfred W. Smith, Esq., Secretary and Treasurer. It will be called the "Carleton Gun Club."

The annual match of the Toronto Gun Club comes off on Wednesday, October 1st, the result of which I will try and send to you. T. G. C.

—Preparations for the coming contest on October 8th are evident at Creedmoor. A new target—1,000 yards distance—has been erected, the storehouse has been moved some 600 yards, so that there is no necessity now for passers to get in the line of fire. The want of water is being looked after, and a well is now being dug. When all the plans of the pains-taking committee are effected there will be fully twenty targets, and in some cases sunken pits for markers will be substituted for raised butts. Raised butts are always more or less objectionable, as, no matter what precautions are taken, lead will spatter at times, and accidents will occur. Quite lately a marker lost some teeth by a fragment of lead from a bullet describing some eccentric course and striking him. One objection to raised butts by riflemen is, that in certain conditions of the atmosphere, and when the sun is at a particular elevation, the targets become as if covered with a shade. Some preparations are also being made for the entertainment of visitors at the Range. We cannot recommend too much caution on the part of members, teams, or detachments. Danger signals should be carefully watched, and marksmen should be particularly warned *never to fire until the last shot is marked*. The violation of this simple rule may result in the death of the marker. Without being desirous of being over suggestive, it might be wise if the committee would have some movable signs made, to be stuck up in any part of the field where men are practising, with the single instruction last mentioned inscribed on them in large letters. An ounce of caution is worth a pound of cure. The entries for the various matches to commence on Wednesday, October 8th, are quite numerous, and we believe the competition for the Judd and Sportsman's prizes will be quite an interesting one. Every one entering for any of the matches must be provided with a ticket, which will be exchanged for a registered ticket on the ground. If practicable, the exact time when the several matches will take place will be published by the FOREST AND STREAM. The third regular

match for the "Turf, Field and Farm" Badge took place on Saturday, the 27th ult. The badge had been won twice by Captain Bodine, and once by Captain Wingate. There were forty-seven entries, and Mr. J. T. B. Collins, with a score of sixteen, carried off the badge. The shooting was not up to the general average. We give some of the leading scores. Distance, 200 yards; five shots; any kind of rifle; trigger to draw not under six pounds:—

—On Monday last, September 29th, a squad of men attached to the Ninth Regiment tried their skill, shooting at 200 and 500 yards, and made very fair shooting. Some trials were made at 1,000 yards, and quite good scores were made.

—The first annual shooting match of the Denver Schutzenverein came off last Sunday, September 28th, winding up in the evening with a *bal champetre*. Between fifty and sixty prizes were awarded. Mr. Borchardt is the Schutzen master and Mr. Joehamus the secretary of the Association.

CLEARING CHOKED GUN NIPPLES.—The following plan for clearing a choked-up gun nipple is familiar to duck hunters on the Chesapeake, where we have frequently seen it used with success. We copy it from *Land and Water*, where it seems to be novel to English readers. In fact, there is something so paradoxical about it that it may be new to some of our readers:—

"In these days of breech-loading, perhaps very few people possess nipples to get choked up, but those who do, and especially those who may go after large game in foreign countries, may find the following plan for cleaning one useful. After pouring as much powder as possible down the cavity, and finding after trial that the gun still refuses to go off, cut a little stick or twig—a match will do if you have one—and, paring it to the right size with your knife, fit it into the nipple, forcing it down on the top of the fresh powder as far as it will go. Cut it off level with the top, put on the cap, and see if it will not make the gun go off. I never found it fail. The first time I had it done to my own gun was when I was in despair at losing two magnificent chances at elephant, close shots, at both of which my gun had missed fire. My idea was that my companion was finally locking up the nipple for good and all, but I let him do as he liked, as there was no other remedy nearer than a nipple wrench in camp, then about fifteen miles off. I was agreeably surprised when the gun did go off, and have repeated the operation, when necessary, with the same success ever since.

Athletic Pastimes.

CRICKET.—The match between the St. George's of New York and the Merion club of Philadelphia, we regret to say, did not come off. The St. George's were fully prepared; the difficulty was that the Philadelphians could not through some unforeseen accident bring together their eleven. If the match had been played it would have been undoubtedly a well contested one. A match between the St. George's and the Germantowns of Philadelphia is on the *tupis*.

—The ninth game of base ball of the championship series between the Bostons and Mutuals took place at Boston, Mass., on September 27th. Bostons scoring fifteen to the Mutuals four.

—To day the Mutuals play the Athletics, and on Saturday the Mutuals will play the Philadelphias, the games to be played on the Union grounds.

—The fall games of the Athletic club take place on Saturday, October 4th. The grounds are at the foot of 130th street, Harlem. Pleasant and exciting contests will doubtless give zest to amateur athletic pastimes in the country.

—The Princeton college nine defeated the Irvingtons on September 27th.

—The Prospect Park Club of Brooklyn, keep vigorously working away every Saturday, at their pleasant ground, in Prospect Park. To-morrow, Friday, there will be a histrionic contest between the actors of the various Brooklyn theatres.

—A local paper states that "five members of the Waterbury (Conn.) base-ball club of nine have died of consumption."

—In Galloway large crags are met with having ancient writings on them. One on the farm of Knockleby has cut deep on the upper side, "Lift me up and I'll tell you more." A number of people gathered to this crag, and succeeded in lifting it up in hopes of being well repaid; but, instead of finding any gold, they found written on it, "Lay me down as I was before."

Yachting and Boating.

HIGH WATER, FOR THE WEEK.

—The race between the well known yachts William T. Lee and the Brooklyn, both of the Brooklyn Yacht Club, came off on September 29th. The course was from twenty-fourth street south Brooklyn, to and around buoy 8½ south west spit, and return, about twenty-two miles. The match was sailed under the rules and regulations of the Brooklyn Yacht Club. The Brooklyn received a time allowance of 17½ seconds. Both yachts got off well together, and had a large number of hands on board. On reaching the Narrows the wind increased, dashing the spray, and often burying the yachts, under their heavy spread of canvas. The Lee was first to reach the south-west spit. Both yachts were now sailing before the wind for home, the Lee ahead, which she maintained, and came home the winner, beating the Brooklyn, by 6 minutes 18½ seconds.

—The Cat boat race came off at Newport, R. I., on September 29th. The course was from a stakeboat at Fort Wallcott to and around the Lightship and return. The wind blew fresh from the southeast, but the little boats got under weigh and started. The race was almost too exacting, as several of the boats came to grief, however the majority behaved splendidly. The E. O. Matthews won the first class prize. The George and Anna the second class. The Dauntless (called after the celebrated yacht) the third class.

—At the meeting of the Brooklyn Yacht Club last week, it was arranged to have a sailing excursion and clam bake on October 8th. Members were notified of an increase of dues from \$10 to \$20.

—Mr. J. F. Lombard, owner of the yacht Enchantress, has challenged Mr. Stockwell, owner of the yacht Dreadnaught, to race across the Atlantic for a wager.

—Mr. J. F. Lombard claims the Cape May Challenge Cup, and in writing to the Secretary of the N. Y. Y. C., says: "I intend to sail over the Cape May Challenge Cup course on Tuesday, the 14th of October next, starting from the Sandy Hook Lightship at 11 M., and to claim the Challenge Cup, unless I am beaten."

—The New Jersey Yacht Club will hold their fall regatta on Thursday, October 9th. The prize will be the Commodore's pennant, and the yachts are to be divided into three classes. First class—Alpha, Julie, Exertion, Twinkle, Emma, Jane Rover, and Jennie. Second class—Pastime, Flora Temple, Jessie, Dexter, Ripple, Dido, and Volant. Third class—Dilks, Sophia, Neptune, Julia, Dreadnaught, Arcola, and Tempest. As so many yachts have entered, it is probable that the races will be very exciting and interesting.

—The yacht Germania, Columbia Yacht Club, had an exciting race last week with the yacht John F. Gage. The course was from the Columbia's club house to and around Fort Lafayette and return. The Germania was very prettily beaten.

—The Kingston regatta took place on September 26th, at Kingston, Ontario, Dominion of Canada. The start was from St. Lawrence wharf. The Ira took the lead, followed by the Coral; Lady Stanley was slow in getting off, but soon gained the lead and maintained it throughout the race. The Ira took the prize, however, owing to time allowance. For the second race eight boats started. The Sunbury, of Belleville, won easily.

ROYAL HALIFAX YACHT CLUB.—This club has of late shown decided signs of "business," most gratifying to all interested in aquatic sports. During the recent visit of the Earl of Dufferin, Governor General of Canada, it took the lead in extending courtesies to his Excellency, the yacht club reception having been the finest entertainment given. In the way of yachting it has done much to awaken a love of the sport among the inhabitants of Halifax, and all summer long the boats of the squadron might be seen traversing Bedford Basin, or stretching down the harbor. It has held three regattas this year—one on the 21st of June, when the challenge cup for first and second class yachts were sailed for, the Petrel, sloop, carrying off the former, and the Kate, sloop, the latter; one on the 1st of August, when the prize consisted of the Prince of Wales Challenge Cup, a magnificent piece of plate of the value of \$500, carried off, on this occasion, by the sloop Petrel; and one on the 19th September, when the three crack yachts of the squadron competed for the "Sambro Cup," value, \$100.

This last match, the finest, longest and best contested on record in the club, was originated for the purpose of trying the merits of yachts and crews in a long distance race. Up to this time the course has always been a harbor one of about twelve nautical miles in a straight line, and it was not thought that the yachts could successfully undertake a race to sea.

—Here is a piece of good advice from the *Telegram*:—"A word to land-lubbers who sail boats. Rarely an accident happens when a boat is well managed. Of late, a class of boats have been built which require great care in handling them—small sloops with one sail of immense proportions. Amateur boat sailors who sail small boats should observe a few simple rules. Never make your sheets fast, as you can hold them easily by taking a half turn round the cleets.

When the wind is "puffy" be very watchful, and "luff" in season, and never "jibe" when it is blowing fresh. If you want to come about, bring your boat's head to the wind. Don't carry sail too long, reef in season. Never carry intoxicating liquors in your boats. With a fresh northwest wind blowing, a man who undertakes to sail a modern built sail boat needs all his faculties clear and unimpaired."

—The fall regatta of the Harlem River Rowing Club took place on September 25th. Mr. James Watson, the referee, started the first race at 3:35 P. M. It was a single-scutt shell race for the championship of the club—distance two miles. The course was from the powder ship to High Bridge. The entries were W. S. Devoe and T. R. Keator. As Devoe did not put in an appearance, the race was a row over for Keator. Time, 15 minutes and 30 seconds.

The second race was pair-oared shells, distance one mile. The entries were R. B. Dodson and F. S. Osborn, white colors; J. W. Arthur and Ed. B. Pinckney, scarlet colors. The race was from McComb's Dam bridge down to the powder ship. The tide was running ebb, and the wind was blowing up and across the river, which roughened the water considerably. Owing to the wild steering of the Whites, the Reds continued to increase their lead, and came in the winners by five lengths. Time, 6 min. 45 sec.

The third race excited a deal of interest. It was a single-scutt shell race (handicap) for a medal presented by Mr. A. C. Saportas. Distance one mile. The race this time was up the river, from the powder ship to McComb's Dam bridge. The entries were: H. M. Knapp, white; A. G. Scranton, natural; W. S. Devoe, scarlet; J. W. Arthur, purple; R. D. Dodson, magenta; Ed. B. Pinckney, blue; C. W. Turner, natural. Of these Scranton and Devoe did not start. Dodson was allowed five seconds start and Turner ten seconds. Dodson was next to the New York shore, with Knapp, Arthur, Pinckney, and Turner outside of him in the order named. At the half mile, and within three lengths of the bridge, Dodson still led, when Knapp put on a brilliant spurt, which was loudly applauded by the spectators, passing Dodson and came in the winner. Time, 7 min. 32½ sec.

The last race was for four-oared shells, distance two miles. The following is a list of the crews:—H. M. Knapp, bow; A. G. Scranton, F. S. Osborn, T. R. Keator, stroke. Head colors, scarlet. Ed. B. Pinckney, bow; J. W. Arthur, J. Symington, Jr., I. C. Halsted, stroke. Head colors, white. Owing to the bad steering of the whites, although we cannot complain of their thorough gameness, the scarlets won the race easily by six or seven lengths. Time, 12 min. 42½ sec.

—By invitation of President Lewis of the Columbia Boat Club, whose headquarters are foot of Court street, Brooklyn, we attended the second annual regatta of the club, which consisted of a six-oared gig race between the light and heavy weights of the club. The time made by the (blue) light weights, from break-water to Bay Ridge dock, distance three miles, seventeen minutes and twenty-eight seconds; the (white) or heavy weights seventeen minutes and forty-five seconds; the blues winning by eleven seconds. The utmost good cheer made the occasion very pleasant. On the return trip of the steamer they received at Bay Ridge a party of ladies and gentlemen, whose company added a new life to the occasion. On arriving at the pier both crews came on board and the winning crew was gracefully presented with a handsome blue silk flag, with gold monogram C. B. C. in the center, in a few appropriate words by a sister of one of the winners. The flag was courteously received by Mr. J. D. Purse, stroke oar of the Columbia. After a few pleasant remarks by Mr. James Foster, all repaired to the Columbia's boat house, where a repast was partaken of by the united crews of the Alcyone, Nereid, Columbia, and invited guests. The FOREST AND STREAM returns thanks for pleasant courtesies.

—The Ridgfield Rowing Club of New Jersey, held their second annual regatta on September 27th, on the Hackensack River at Little Ferry. The course was from the bridge at Little Ferry down the river, to a stake boat and return. Distance two miles. The United States revenue cutter Dana was occupied by the judges and a few invited guests. The first race was between George L. Wilson and George Law, in single scull shells, for the Champion's Badge of the Club and President's Cup, and was won by Wilson. Time—17 minutes. The second race, with four-oared gigs, for a silk flag, open to all amateur clubs, was contested by the Atlantic Club of Hoboken and the Ridgfield, and was won by the former. Time—15 minutes 15 seconds. The third race was between single scull boats open to members of visiting clubs for a handsome gold badge. The race was won by C. Myer of the Nassau Club. Time—15 minutes 26 seconds. The last race was between junior members of the Ridgfield Club, single scull shells. The first prize was a handsome gold badge, and the second, a silver shield and sculls with the inscription, "Ringfield R. C. Regatta, September 27, 1873." Law won in 15 minutes and 32 seconds.

—The Nereid Boat Club of Brooklyn held an eight-oared barge race on September 27th, a large number of the friends of the club attending. The course was from the boat house, foot of Court street, to a stake boat, one mile straight away and return. The Galateas obtained the lead at the start and maintained it throughout the race, beating the Nereids by over fifteen lengths.

—The Princeton University Boat Club entries for the four oared race—A. Burt, W. M. Smith, J. M. Taylor, David Paton.

—James Ten Eyck has challenged William Scharff to row at Peekskill on the Hudson, for \$500 a side. W. Scharff has accepted the challenge, and an early date will be selected for the race.

—The Logan four-oared crew of St. John, N. B. have challenged the Ross Foley crew of Halifax to row at either place for \$200 or \$400 a side.

—The following are the entries for the National Amateur Regatta, to be rowed at Philadelphia on October 7:—

FOUR-OARED RACE FOR CHALLENGE PLATE AND FOUR GOLD PRESENTATION MEDALS.

Nassau Boat Club, New York City—Frank G. Brown, John Walker, A. W. Montgomery, Oliver T. Johnson, Charles Myers, Lindsey Watson. Friendship Boat Club, New York City—William H. Hughes, Thomas Allen, Michael Robinson, W. T. Hurley, J. McCahill. Analoan Boat Club, Washington, D. C.—H. M. Gurley, A. L. Prescott, Thomas H. Upperman, Charles A. Brown, Richard H. Morgan, M. Bailey, Richard J. Clarke.

Billy Scarff Rowing Club, Pittsburg, Pennsylvania—James Mulrey, C. A. Barr, Frank Cubbert, Charles Ludwig, W. R. Hackert.

Crescent Boat Club, Philadelphia, Pennsylvania—C. E. Steel, H. E. Witmer, A. Sperring, William C. Rehn, T. B. Harper, William Barnhurst, W. A. Steel.

Quaker City Barge Club, Philadelphia, Pennsylvania—J. D. McBeath, J. Fowler, F. Eyre, S. Gormley, J. E. Reyburn, S. Stinson, J. D. Ferguson.

Vesper Boat Club, Philadelphia, Pennsylvania—James B. Mingus, Harry B. Moore, Frank B. Evans, Harry McMillan, W. W. Maris, Alonzo Parsons, Robert W. Skinner, Charles Howard.

Argonauta Rowing Association, Bergen Point, New Jersey—Ed Smith, Walter Man, B. Stephenson, F. C. Eldred, E. R. Craft, E. T. Bramhall, M. A. Phillips.

Princeton University Boat Club.—This Club omitted to send the names of the crew with the entry. They will be published as soon as received.

PAIR-OARED AND DOUBLE-SCULL RACE FOR CHALLENGE CUP AND TWO GOLD PRESENTATION MEDALS.

Vestry Boat Club, Philadelphia—J. Bonsall Taylor, William H. Adicks.

Crescent Boat Club, Philadelphia—Clarence E. Steel, H. F. Wilmer, W. G. Thomas, John Lavens.

Friendship Boat Club, New York City—W. H. Hughes, W. T. Hurley, Thomas Allen, J. L. McCahill.

New York Athletic Club, New York City—P. A. Curtis, C. H. Cone.

Columbia Boat Club, Allegheny City, Pennsylvania—Robert Brown, Edward Means.

Argonauta Rowing Association, Bergen Point, New Jersey—Two crews—Walter Man, B. Stephenson, E. R. Craft, Fred C. Eldred, Ed Smith.

SINGLE-SCULL RACE FOR THE "WILKES" CHALLENGE CUP AND GOLD PRESENTATION MEDAL.

Riverside Rowing Club, Rochester, New York—Theron E. Parsons.

Atalanta Boat Club, New York City—three entries—Dr. Russel Withers, Edward Blake, Henry B. LeRoy.

Friendship Boat Club, New York City—W. H. Hughes, J. L. McCahill.

Nassau Boat Club, New York City—Charles Myers.

Billy Scarff Rowing Club, Pittsburg, Pennsylvania—James Mulrey.

Analoan Boat Club, Washington, D. C.—Richard J. Clarke.

Pennsylvania Boat Club, Philadelphia—John Lavens, Jr.

Bachelors' Barge Club, Philadelphia—Frank S. Pleasanton.

Undine Boat Club, Baltimore, Maryland—J. H. C. Watts.

Union Springs Amateur Boat Club, Union Springs, New York—Charles H. Courtney.

Argonauta Rowing Association, Bergen Point, New Jersey—Walter Man, Ed Smith.

—The Brown and Biglin scull race came off in Halifax harbor September 24th. The course was five miles. The first mile was made in 6½ minutes, both being close to one another. The homestretch was made in grand style, Brown passing the judges' boat several lengths ahead. Everybody feels satisfied that it was a fair race, to which opinion Biglin and his friends subscribe.

—Mr. Thomas Brassey, M. P. for Hastings, has just passed the examination of the Local Marine Board of the Port of London, and obtained his certificate of proficiency as a master in the mercantile marine.

The Horse and the Course.

The races at Prospect Fair Ground Association terminated September 27th, with a good day's sport. The attendance was very large, and the weather charming. The first race was for a purse of \$1,000, for horses that had never beaten 2:45. There were fourteen entries; eleven of them came to the post. Hopeful won the three last heats and race, having lost the first two heats purposely, for his driver, Jarvis, deliberately pulled the horse, which was apparent to all, as when Charles Green was substituted, the grey gelding made six and seven seconds better time. This disgraceful proceeding was visited by the judges with the strongest disapprobation, and the horse's owner, L. C. Chase, was ruled off the course forever, and consequently off all the courses belonging to the National Association. The last race was for a purse for \$3,000, for horses that had never beaten 2:20; best three in five, in harness; mile heats. J. J. Bowen's black g. Camors won the three last heats and race. Time, 2:23½, 2:22½, 2:24½.

—The Nashville Blood Horse Association began their fall meeting on September 29th. The first race was for the Young America stakes for two-year olds; mile dash. Vaulress won in 1:54½. The second race was for the hotel stakes for three-year olds; mile heats. Madeira won two heats. Time, 1:51½, 1:53½. The third race was a mile and a quarter dash. The race was won by Stamford. Time, 2:20½.

—The American Jockey Club begin their fall meeting on Saturday next, on their beautifully appointed grounds at Jerome Park, near Fordham. The following is the list of gentlemen who own large stables and have many entries: A. Belmont, M. H. Sanford, W. R. Babcock, A. B. Lewis & Co., The Valley Brook Stable, Frank Morris, Dr. Weldon, D. McDaniel & Co., Messrs. Hunter and Travers, D. D. Withers, H. P. McGrath, M. A. Littell, D. J. Bannatyne, Joe Donahoe, P. Lorrillard. The first race is a dash of three-quarters of a mile. The second race will be the great event of the day—the Jerome stakes. The famous three-year olds, Count D'Orsay, Katie Pease, Tom

Bowling, and Springbok will meet again. Distance two miles. The third race is the Nursery stakes, a dash of a mile for two-year olds. The fourth race is the Manhattan Handicap for all ages, a mile and a quarter. The fifth race is a selling race for a purse of \$500—a dash of a mile and three-quarters. On the same day a match between Mr. L. Lorrillard's four-year old filly Girl of the Period, and Mr. Peet's four-year old filly Ophelia; half-mile heats. In the Nursery stakes, Mr. Belmont has wagered that Steel Eyes will beat Mr. Morris' filly Regardless, one or other to be placed.

POINT BREEZE PARK, PHILADELPHIA, September 25th.—The first race was for a purse of \$500, mile heats, best three in five, in harness. There were three entries, all of whom came to the post. W. H. Dobb's Snowball won the three last heats. Time, 2:33½, 2:34, 2:35.

The second race was for a purse of \$2,000, mile heats, best three in five, in harness. Goldsmith Maid and Judge Fullerton entered. After an exciting race between these well-known horses, Goldsmith Maid won. Time, 2:22, 2:22½, 2:23½.

—The Prospect Park races were attended on September 25th by a large number of people. The track was in excellent condition. Five horses started for the first race, which was for a purse of \$1,250. Morrel won in 2:28½. The driver of Morrel was enthusiastically cheered for his splendid driving. The second trot was for 2:29 horses, and for a purse of \$1,750. Five horses started. Bruno won the race in three straight heats. Time, 2:28, 2:25, 2:26.

—The owner of Judge Fullerton has issued a challenge to the world, stating that he will trot his horse against any horse, mare or gelding in the world, mile heats, best three in five, in harness, over Fleetwood Park Course, for ten thousand dollars a side, half forfeit. Race to be trotted between the 10th and 20th days of October.

—Chas Reticker, who has just accomplished the feat of riding fifty miles in two and a half hours, offers to ride fifty miles in a shorter time than any two men—one to ride twenty-five miles and the other the same distance. He proposes also to accomplish one hundred miles in a shorter time than any three men—one to ride thirty-three miles, the second thirty-three, and the third thirty-four miles—all parties to use horses which have no record; the matches to be ridden over the Greenland Racing Course, near Louisville.

—A veterinary surgeon of Philadelphia says that tight reining is a common cause of the disease known as "roaring" in the horse, by mechanically obstructing free perspiration, especially affecting horses driven in pairs or in double harness. In the heavy draught or team horse, he says, the practice is cruel, and the surgeon has been trying for years to induce drivers and owners of horses to discontinue the use of the check rein.

ENDURANCE OF HORSES.—Some curious and interesting experiments were made some years ago at Alfort, the French veterinary school, to ascertain the endurance of horses. It appears that a horse will live on water alone twenty-five days; seventeen days without eating and drinking; only five days if fed and unwatered; ten days if fed and insufficiently watered. A horse kept without water for three days drank one hundred and four pounds of water in three minutes. A horse taken immediately after feeding, and kept in active motion, completely digested his feed in three hours. When kept perfectly quiet in his stable, digestion had just commenced in three hours.

The Police Commissioners of Jersey City have recently purchased horses for the mounted service. The one which Officer Glenn of the Third Precinct rides is ravenously fond of tobacco, which he chews like an old veteran. When shown a paper of tobacco, he manifests as much anxiety to obtain it as a hungry horse does to obtain his feed of oats. Unlike an ordinary tobacco chewer, he does not expectorate promiscuously, and when he has extracted the strength of the weed he quietly swallows the quid.

—The will of the Rev. Abijah P. Cummings, editor of the New York *Observer*, was before Surrogate Coffin in White Plains. There was a stir in the court-room when the inventory of his estate was read. The reverend gentleman had speculated in worthless stocks. Among them were 100 shares in the United States Leather Manufacturing Company, 320 shares Valley Coal Company of Wilkesbarre, 500 shares Mamakating Mining Company, 300 shares Broadtop Coal and Iron Company, 100 shares Knickerbocker Anthracite Coal Company, 76 American Eyelet Company, 500 New York Mohamea Mining and Discovery Company, 300 shares Atlantic and Great Western Petroleum Company, and other worthless paper. There was a deposit of \$27,000 in the Union Trust Company.

—Mr. J. M. Bailey, the *Danbury News* man, advises his sporting friends to read the FOREST AND STREAM. "Then," he says, when they array themselves against the blood-thirsty pumpkin seed and the ferocious robin, the agricultural community will not have to adjourn to their wells."

—Last Monday the Athletics secured a victory over their city rivals, the Philadelphia White Stockings, by a score of 7 to 6, after seven previous unsuccessful attempts.

—In the contest between the Nassau and Concord Baseball Clubs, at Prospect Park, on Saturday, the former won by a score of 18 to 7.

—Up to September 30th the number of legal games played in the championship arena, the Brooklyn *Eagle* says, was 134, of which the

Athletics.....	won 21 and lost 18.
Atlantics.....	won 12 and lost 29.
Baltimore.....	won 23 and lost 15.
Boston.....	won 28 and lost 11.
Mutual.....	won 17 and lost 23.
Philadelphia.....	won 30 and lost 12.
Washington.....	won 3 and lost 26.

There are no less than five first-class matches on for to-day, October 2d.

Military News.

SINCE January, 1872, the United States Army has lost two major-generals, namely, Major-General Halleck, who died January 9th, 1872, and Major-General George G. Meade, who died November 6th, 1872.

—Brig-General Silas Casey, U. S. A., retired, the author of "Casey's Tactics," for so many years in use in the army, is a hale old resident of Brooklyn, New York. The author of the present tactics of the army, General Emory Upton, Lieutenant Colonel of the First Artillery, is Commandant of the Cadets at the Military Academy, and instructor of artillery, cavalry, and infantry tactics at that post. It is he who first teaches the new military idea how to shoot, and who drives into the noddles of the young plebes that "right forward, fours right" does not mean "right forward, fours left," &c.

—Brevet Brigadier-General H. L. Abbot and Brevet Col. Thomas L. Casey, of the U. S. Engineers, are in France, looking after the interests of their own peculiar service, and noting how much better we do some things at home, and how much inferior we are in others. At one time we imagined France and other nations could teach us considerable, but a few years of war in our own country developed more of the sciences and arts of war than perhaps ever before heard of. France, now that she has lost so much of a bombastic confidence in her own strength, will profit largely by the lesson. The talent is not dead, and the people have the will. Germany is to-day undoubtedly the strongest and most progressive warlike nation of the world.

—Second Lieutenant M. Frank Gallagher, of the Second Infantry, who in May last, brutally shot and killed a discharged soldier, at Spartanburg, S. C., and who afterwards was tried on the charge of "conduct unbecoming an officer and gentleman," has suffered the mild punishment of being cashiered the service, which sentence has been approved by the War Department. This, probably, is about all the army could do in the matter, and the civil authorities will now be compelled to take up the case, and see that the murderer is properly punished. It is perhaps well here to state, *en passant*, that the treatment of the enlisted men of the army is not always such as to secure the necessary respect desired. Officers are too frequently overbearing and tyrannical towards their men, who often obey only through fear, instead of performing their duty with the pride of a soldier. A man, because he enlists, is not necessarily a slave, nor does the Government expect him to perform menial labor or any other duty but what is naturally expected of a soldier. Therefore, when an officer compels a man through fear of punishment to execute a task which in any way demeans the uniform he wears as a United States soldier, this man soon loses all respect for the army and its government, and at the first chance deserts. The army contains, it is true, many hard characters among its enlisted men, but officers will find that an appeal to a man's self-respect goes a great way in the majority of instances; and in the end will secure far better discipline than the tyrannical process so much in vogue in both services.

—Many of the engineer corps stationed at Willet's Point, N. Y., earn considerable money for their services as markers at the National Association Range at Creedmoor, L. I. A certain number of reliable men are daily granted passes, and those who stroll to the range a few miles distant generally make it pay. The Association price of markers per day, is two dollars. Recently, however, the men have charged three dollars per day to all outside organizations requiring their services, and there is scarcely a day but that a dozen markers are employed, and very frequently more than this number. In ordinary marking for parties practicing for a few hours, the men get two dollars. The duties of a marker are very simple and by no means laborious and with ordinary care no wise dangerous. Now and then, however, one is slightly exposed by the splutter of lead on the targets; which is sometimes the fault of the firing party, and then again the sheer carelessness of the markers themselves in not giving sufficient time for the danger signal (red flag) to attract attention at the firing point before leaving their post. Some of these markers are veterans, and in times past have become so used to the buzzing of bullets they have become careless and don't seem to mind them, "worth a cent." There is nothing, you know, like being used to these matters. We understand it is the intention of the Rifle Association to employ regular troops altogether on the occasion of its regular prize meeting, commencing October 8th, for markers, scores, &c. They will require about fifty men for three or four days, and propose to pay two dollars a day for their services.

—Major Gen. McDowell was at the reception given to Wilkie Collins at the Lotos Club rooms, New York city, September 27th.

—Brevet Major Maubken, the dashing adjutant of the Eighth Cavalry, so long stationed in New York city, is now wasting his chances for his country's good at the post of New Mexico.

—Many years since, or in the good old times when the chapeaux, the stocks, ruffles, knee breeches, &c., were worn as portions of the full dress of our officers, a small party of officers attached to a harbor post in New York, started in full uniform in a Government yawl across the East river to attend an evening reception to which they had been invited in the metropolis. The officer in command of this post, and who was one of the party invited, was a soldier of the old school, one having the most peculiar notions of the dignity of his position and the nicety of his dress.

Just as the boat reached midway of the stream, a sailing vessel under full headway was discovered bearing for the boat, and the chances were that they would surely be run down. The commanding officer in the stern of the yawl sung out for the men to "give way with a will," which they did, but only just in time to pass under the bows of the vessel. In passing, however, the commandant, thinking the boat was lost, eagerly reached up and caught the bowsprit chain of the vessel, and as he did so, the yawl passed from under him, and left him dangling on the bow of the vessel, his elegant knee breeches submerged in the briny waters. His position as he hung—high but not dry—was extremely ludicrous, and after being rescued rather put a damper on the anticipated enjoyments of the reception, as well as for years being the joke of his fellow officers.

—Captain Richard Comba, Seventh Infantry, recently sentenced to be cashiered for neglect of duty etc., by recommendation of the Court and the reviewing officers, General Terry, on account of previous good character, had his sentence commuted by the President to suspension from rank and command for the period of six months and the forfeiture of all pay during that period with the exception of \$50 per month. Fortunately in this case previous good character saves an officer from utter disgrace.

—Major David Faggert, Paymaster, U. S. A. resigned September 11th.

—Camp Haulpai, Arizona Territory, has been discontinued.

—Companies H. and K. First Cavalry have left Fort Walla Walla, Washington Territory, for Camp Harney, Oregon; Company B Fifteenth Infantry, Fort Craig, New Mexico, for Tabrosa, New Mexico; Company B, Twenty-third Infantry, Camp Date Creek for Fort Whipple, Arizona Territory, and Company K. Twenty-fourth Infantry, Fort Duncan, for Ringgold, Barracks, Texas.

—Captain J. J. Van Horn of the Eighth Infantry has been granted a five months' leave, to take effect on the return of the Yellowstone expedition.

—Colonel W. H. Wood, of the Eleventh Infantry, commanding at Fort Richardson, Texas, reports that on the morning of the 13th inst., three citizens were attacked by Indians, at Little Salt Creek, a branch of Kechi Creek, and two of them, Mr. Howell H. Walker, aged fifty years, and his son Henry, aged thirteen years, were killed. The other, Mr. Mortimer Shreeves, made his escape and reached Fort Richardson at five P. M., having been compelled to travel some twenty miles in a circuitous route to avoid the Indians, although the distance in a direct line is about nine miles. Captain Thomas Little, of the Tenth Cavalry, with all the available officers and men of his company (L), was at once ordered out in pursuit, with instructions to investigate this affair, and ascertain the names of the persons killed, and send their bodies to the fort, as it was understood they were residents of Jacksboro, and should the trail of the Indians be found, make a vigorous and determined effort to overtake and punish them, sparing neither men nor horses to accomplish that object. The bodies of Walker and his son were found horribly mutilated. The Indians took away the old man's gun, cartridges, and shoes and the boy's hat. Captain Little found the trail at daybreak on the 14th, and started at once in pursuit. Mr. Shreeves says he counted twenty-seven Indians as they were approaching to make the attack.

—A correspondent of the *Commercial Advertiser*, writing of the Lake George region, says:—

"The mountains about this portion of the lake are infested by rattlesnakes, whose dens are the crevices in the rocks where they can remain during the winter below the reach of frost. During the summer they are out and around on the hills, but upon the approach of cold nights they return to their habitations, and are to be found about this season of the year near their homes. Frequently they are seen swimming across the water, and a good old gentleman, a deacon, I am told, on Lake Champlain, saw a number thus swimming, and getting into a boat, rowed out and killed no less than twenty-nine, the largest number ever killed by any one in this locality at one time. I know the story does not sound fishy, but rather snaky; still I had it from a man who was personally acquainted with the deacon, I forget his name, and have since seen the statement in print in one of the locals. Just beyond Sabbath Day Point lives a man named Davis, a celebrated rattlesnake catcher, whose reputation has reached every place for miles around, and who is rightly esteemed the second of the natural curiosities about the Lake. Davis is one of the old settlers, and knows every den and the number of snakes inhabiting it in the vicinity. He catches the snakes by putting a notched stick over them just below their heads, which renders them powerless, and then he extracts their fangs. He catches the snakes whenever anybody wants them, but generally has a quantity on hand in a box at his house. He furnishes them, dead or alive, as may be desired, for the small sum of a dollar apiece. Those who want to try their hand at bringing up these pets, and mothers who want rattles for their children, had better invest. Davis sometimes goes out to catch snakes in his bare feet, and has been bitten several times, but he counteracts the effects of the poison by eating what is known as 'rattlesnake weed,' and applying it externally. This is a sure cure, and while perhaps less to the liking of some than the 'whiskey cure,' is nevertheless more certain; its effect is very similar to that of tobacco upon the system, and the leaves have by no means a pleasant taste. There are some people, however, in our worthy metropolis who are so saturated with alcohol all the time that they could with impunity expose themselves to the fangs of the rattlesnake, and should they be bitten the only result probably would be the death of the snake.

—In what tone does a ghost speak? In a tombs-tone.

Art and Drama.

ON Monday night the Grand Opera opened at the Academy of Music with "La Traviata," Mme. Nilsson as "Violetta." This lady is indebted as much to her personal popularity as to her professional abilities for her hold upon the hearts of the fashionable and music-loving world of this city. We mention this fact to strengthen our previously made assertions, that the Grand Opera is still, as an institution, an exotic, and no effort in any direction can be left untried which will force up the subscriptions to meet the enormous outlay attending these performances. The occasion was somewhat damped by the fact that it served as a background for the announced appearance on the Wednesday following of Signor Campanini, who comes before us with all the "marvelous freshness," so much praised by the London press, and which press has very little influence in musical matters over our public.

The regular season of the Union Square Theatre opened on Wednesday night, with a company commendably strong, with a promise from the management that its boards will present plays carried through by excellent performers, instead of sensations and scenery. Now that Wallack's has gone the way of all the earth as the nestling place of legitimate comedies, the public must look, as a rule, to the Union Square for the best attractions of the social drama, and we have no doubt that it will eventually be recognized as the place where families will be most likely to find highly cultivated and pleasant recreation for a leisure evening. The opening night presented a new play, entitled the "Cross of Geneva," rather an unpromising beginning for the five comedies which are to follow. But managers are obliged to surprise their audiences as well as please them, and no doubt the "Cross of Geneva" will answer the first desire. The hour we go to press precludes the possibility of any critical notice. We congratulate our playgoers on the reappearance of Miss Etyng, who, we understand, after some four years of retirement, resumes her professional career with a determination to pursue it with enthusiasm, and devote her energies to the achievement of the highest possible position in her power.

The new Park Theatre, located on Twenty-second street and Broadway, building under the direction of Messrs. Stuart and Boucicault, is rapidly approaching completion, all the artists having been engaged. But for some difficulty in obtaining a satisfactory title to some portion of the ground on which the theatre stands, it would have been opened at the beginning of the present theatrical season. To the old residents of our metropolis, the revival of the name of the Park Theatre will be gratefully welcome. No positive announcement is made of the character of the performances. With so many theatres all under way we think there will eventually be a "corner," and two or three will be swept away in the "crash."

Salvini is beginning to be understood better and better after each performance. He is personally a man of the finest presence of any actor that has ever appeared on our stage. Tall, grandly developed, with a fair complexion, a dark, penetrating eye, expressive features, and a mobility of movement of the muscles of the face that was not surpassed probably by the elder Kean.

The Faust Club, of Brooklyn, composed mainly of actors, journalists, and artists, on Saturday presented to their city a bronze bust of John Howard Payne, author of the popular song of "Home sweet Home." Mr. Payne was born in New York city on the 9th of June, 1791, but his father for a while was established as a physician at East Hampton, which fact identified him with Long Island, a fact that has been so handsomely acknowledged by the members of the Faust Club. Over thirty thousand persons were present to witness the ceremony of unveiling. The bust, as a work of art, is excellent, and the likeness is pronounced quite perfect by intimate friends of the deceased poet.

Mme. Nilsson on last Sunday attended St. Thomas', Fifth avenue. Her presence was greeted by a choir of forty performers. After the services for the morning were over she visited the choir, where she was welcomed by Dr. Morgan rector. Verily, the Opera and the Church shook hands on the pleasant occasion.

Mr. Brougham has, for the present, left the stage, and is announced as a lecturer. His subject is "Darwinianism." He proposes to illustrate the text of his argument of the gradual development of the lowest order of shell fish into our sweethearts and wives by drawings on a blackboard, Mr. Brougham being most expert with his pencil. We have no doubt but that Mr. Brougham's clerical manner and singularly severe expression will have a very edifying effect on his audience. If the ushers are not watchful some people will "lark out in meeting."

At a reception on Saturday night, given to Wilkie Collins by the Lotos Club, Mr. Bradlaugh was present as an invited guest. After the usual ceremonies, the usher for the evening called on Mr. Bradlaugh for a few remarks. Mr. Bradlaugh made "a few remarks" in his peculiar and most radical vein, which were received with the wildest enthusiasm by the members of the club. In conclusion, he said, by way of parenthesis, that there was not a fashionable club in London which would permit him (on account of his political principles) to cross its threshold, and that "at home," for the same reason, there was an almost impassable social gulf between himself and the honored guest of the evening. Our institutions are very leveling, leaving every man to stand on his merits—with some glaring exceptions.

Nilsson, Carlotta Patti, and Sims Reeves are making a

stand against the "Diapason," obtained in Great Britain. Sims Reeves says he has waged war against the unreasonable pitch for years. In Vienna, Paris, Berlin, Brussels, Naples, and Florence the pitch is considerably lower than the British, and all alike. Mme. Nilsson is reported to have declared she will not sing in London again until a change is made. Verdi's music, or rather the prejudicial effect of it upon the high notes of the voice, is developing more and more. These counterfeit notes are neither easy or agreeable, in fact they are unnatural. The Italians must get back to a more natural style. These fireworks and transition scenes in the human throat are as pernicious as they are on the sensation stage.

There is a new musical instrument invented by one Frederick Kustner, who gives it the significant name of Pyrophone. The tones are produced by a gas jet, and partake of the quality of the voice and an æolian harp. If this is so it will be a sweet novelty.

Mrs. Charlotte Winterburn has become conductor of a new choral society of graduates taken from the Normal School.

Mr. Simpson, the Scotch ballad singer, has given his well-known name to a quartette formed of rich, fresh, well-trained voices, destined to sing glees and madrigals without accompaniments.

Miss Ward, an American actress, who has elicited some interest in literary circles in London by her dramatic effects, is shortly to appear at Manchester, England, as Lady Macbeth.

One of the pleasing events of the week was the reception of Wilkie Collins at the Lotos Club. The novelist occupies Dickens' rooms at the Westminster. In this matter, at least, he resembles Dickens.

Miss Violetta Colville, an American debutante at Milan, has received the honor of a paid engagement in that city. Generally the pay is the other way, large sums being proffered and accepted for the opportunity to display vocal prowess in opera. Rival and professional jealousies prevented her acceptance of the offer. It is possible she may make her debut in New York next spring.

Mr. Lester Wallack played last week in Brooklyn (new Park Theatre) before a large audience, in his own play of "Central Park," with much of his former ease and sprightliness.

There is a quartette formed in Brooklyn for the performance of English operettas and operas that can be given without chorus. This club is of ability, will be popular in the country, and will serve to educate the people. In this connection, we would state that there has also been organized in this city a company of four of our best dramatic singers for parts of Italian operas in costume, and without chorus. The performance promises to be exceedingly effective.

INDIAN GOVERNMENT VS. CROCODILES.—The *Field* has an interesting article in regard to crocodiles. Some years ago the Indian Government offered a reward of one rupee (2s.) per foot for every crocodile not less than five feet long which should be killed in Malabar. This reward did not seem to have been sufficient to stimulate the natives to go in for crocodile catching on a large scale; consequently but few were captured. About nine months ago the restrictions as to size were rescinded, and a general *battue* of crocodiles commenced. Some idea of the number killed may be formed when considerably more than 30,000 rupees, or £3,000, was paid during a period of six months. Between the crocodile of Egypt and that of India there seems to be but very little difference. There seems to be no end of ingenuity in the English officials offering a reward for killing a noxious creature by the foot.

—The monster ship which England has christened the Shah, out of compliment to the potentate, has just been launched at Portsmouth, and is regarded as one of the completest ships in the navy. She is built of wood, and is the fifth of the new wooden vessels which have been introduced into the navy. There is nothing remarkable about her construction, but considerable interest has been excited about ships of this class from the mere fact that they are wooden, and that in the present day it should be found desirable to recommence wooden ship-building.

—A remarkable and important geological discovery has been made south of Golden, Colorado. It is a deposit of gray clay filled with trunks and limbs of trees resembling cedar, but transformed into bright, hard coal. Over it is a capping of conglomerate, and over that coarse sand rock. The coal deposit is tilted at an angle of thirty-five degrees. Apparently co-extensive with the conglomerate are found rude flints, tools and arrow-heads, indicating that ages back what is known as Colorado Territory was inhabited by a people who manufactured stone implements.

—There is a guano island in Lake Minnetongo, Minnesota, newly discovered and containing eleven acres, a portion of which is covered with a deposit identical with that found on the guano islands of the Pacific, though not as thick. It has been occupied by a squatter for a number of years, and he has only just become aware of the value of his possession by being offered a large sum for it as soon as a title can be perfected, which can be done under the homestead and pre-emption laws. As this island has been omitted from the United States' surveys, it will be necessary for him to secure a special patent.

—Among the incidents of the late gale on the coast of Nova Scotia, it is related that a schooner at Cow Bay, coal laden, with a deckload of cattle and sheep, was driven away up into the woods, and the captain knew nothing of the disaster, till next morning he heard the cattle bawling and the sheep bleating among the trees.

The best use you can make of seventy-five cents, will be to buy a game of Ayilude, the most instructive and delightful game ever published. If your dealers have not got it, send the money to West & Lee, Worcester, Mass., who will forward it by mail, postpaid.

"The best of its class."—*Boston Evening Transcript*.

New Publications.

[Publications sent to this office, treating upon subjects that come within the scope of the paper, will receive special attention. The receipt of all books delivered at our Editorial Rooms will be promptly acknowledged in the next issue. Publishers will confer a favor by promptly advising us of any omission in this respect. Prices of books inserted when desired.]

GOING SOUTH FOR THE WINTER. By Robert F. Spier, M. D. New York. Edward O. Jenkins, 20 North William street. Illustrated with twenty engravings.

In the preface to the second edition of this truly interesting work the author very modestly disclaims any particular merit in the same. We think him altogether too modest. From the long and successful experience of an active, studious profession he has given to the public many valuable discoveries, observations, and suggestions—things "new and old," the sterling information thus given, especially relating to pulmonary diseases, being invaluable. The necessity of persons of a pulmonary habit needing a change of climate more than active medical treatment is clearly shown. Who should go to the South for the winter, how they should prepare themselves for this journey, and how they should live while there, their diet, &c., are just the subjects treated upon in this work. In a pleasant, crisp, and satisfactory manner the doctor tells you just what you should, and should not, do. Besides much knowledge of a purely medical character, derived from the severe application and close study of a medical man who loved his profession, may be found many cogent and strong arguments in favor of a morality that all our young men and young women would find it perfectly safe to follow. The following home truths, coming as they do from our bachelor friend, the doctor, should have due weight (as we presume they will) with the many readers of "Going South;":—

"An indirect cause of pulmonary disease among young men is the need of a cheerful, *confiding companion*, for 'It is not good for man to be alone.' Just so long as man and woman are mutually necessary to each other there can be no real happiness for single men or women. A single man ill or unhappy, is forced to go to associates or friends for sympathy, while the married man has a sweet tempered wife to care for him, and has no need of the 'deceitful friends who cast aside the veil they used to wear.'"

"Let every young man marry early, for therein consists the only happiness—the sure road to success in life; and in all his efforts to secure the glory, titles, or riches of his ambition he will receive the hearty approbation of his wife, which is far better than the deceitful applause of the world."

"What chiefly deters young men from entering into married life early is the preposterous nonsense of love of dress, and the fear of marrying a wife doting on extravagant display, and ignorant of all those little domestic arts that make families happy."

The doctor is justly severe upon that most pernicious fashionable habit so much practiced by young ladies of the present day. He says: "For the consumptive to visit public places of amusement and ball rooms, and breathe such an irritating atmosphere, as for hours they do, is simply to peril life."

"What inconsistency for girls with weak lungs to be found on the dancing-floor, frantically whirling around, and strained to the breasts of men they may have only been just introduced to, and know nothing of. Why is it that pure, modest young girls show so much squeamishness towards a man they have known from childhood, holding his hand at arm's length, but behave outrageously foolish on the floor of a ball-room, where they are ready to be clasped in the arms of a man they knew nothing of, and till that hour a perfect stranger; and yet, with her head reclining on his shoulder, his arm around her waist, she shrinks not from his embrace?"

We would like to quote from this live book many of its sterling facts upon the many causes that make the consumptive's road to the grave so sure and swift. This is one of the reformatory books of the times, and although written for the especial perusal of a few friends, we are sure it will be read by many, and we trust it will be the means of opening the eyes of many of our young ladies to that fatal practice of keeping late hours, eating late suppers, and dancing all night in ill-ventilated rooms. A third edition of this work, enlarged and improved, is now in press.

ANNOUNCEMENTS.

FOX HUNTING. By C. A. Stephens. James R. Osgood & Co., Boston. A new volume of the "Camping Out Series." Illustrated. 16mo.

BOOKS TO APPEAR IN OCTOBER FROM THE PRESS OF JAMES R. OSGOOD & CO., BOSTON.

THE STORY OF GOETHE'S LIFE. By George Henry Lewis. With portrait. 16mo. Condensed from the larger "Life and Letters," published some years since.

PICTURESQUE NORMANDY. By Henry Blackburn. Illustrated. Red edges. This work is by an author who knows how to handle his pen, and his sketches are of the most superior and attractive character.

DOING HIS BEST. By Q. T. Trowbridge. Illustrated. This is a sequel to "Jack Hazard" and "A Chance for Himself." To say Trowbridge wrote it is sufficient to warrant its acceptance by all our young readers.

ON THE AMAZONS. By C. A. Stephens. Illustrated. A new volume of the "Camping Out Series." It is a sequel to that highly interesting book known as the "Trotting Book."

Quite a large number of very valuable and interesting works will be issued in October by this house, which, we can assure our readers, will not fail to instruct and amuse.

NOVEMBER.

ARTISTS AND ARABS. By Henry Blackburn, author of "Picturesque Normandy." Illustrated. 18mo. Red edges. This will be found a fitting companion to "Picturesque Normandy."

HISTORIC FIELDS AND MANSIONS OF MIDDLESEX. By S. A. Drake. Illustrated with heliotype and wood cuts. 8vo. This work is one of the finest class books of the day, and to every student of history will not only add materially to his stock of historical lore, but afford information upon many material facts connected with the old historical events and legends concerning the early history of Massachusetts.

THE TOURMALINE; its relations as a gem; its wonderful physical properties, &c. By C. A. Hamlin, M. D. With four illustrations in colors. 12mo. Price \$2. From what we know of Dr. Hamlin we can promise in this book a rare and wonderful history of a gem but little known to the public.

THE EGYPTIAN SKETCH BOOK. By Charles G. Leland. Hurd & Houghton, Riverside Press, Cambridge.

THE SHAKESPEARE TREASURY. Charles W. Stearns, M. D., New York. G. P. Putnam & Sons.

THE LAWRENCE. A TWENTY YEARS' HISTORY. By Charlotte Trumbull. American News Co., New York.

MAGAZINES RECEIVED.

THE PLANTATION—ATLANTA, GA. This is an exceedingly neat magazine, of some 75 pages, containing no end of useful matter. Its make-up is in the highest degree creditable, and the general excellence of the contents assures us of the growing prosperity of the South.

BY CHARLES HALLOCK,

Secretary of the "Blooming-Grove Park Association."

ILLUSTRATIONS, CROWN 8VO., CLOTH \$2.00.

Mr. Charles Hallock is one of the few gentlemen who
write a book mainly for the reason that they have some-
thing to write about—have something to tell the public
which the public desires to know. The shortest routes
to pleasure are laid down, and correct information is
given as to the best means of conveyance, the expense
of the trip, the secrets of the commissariat, etc. The
author has avoided the use of technical terms, and thus
made his volume all the more acceptable.—*Turf, Field
and Farm.***II.****Prime's I Go A Fishing,**I Go A Fishing, by W. C. PRIME, author of "Boat Life
in Egypt," "Tent Life in the Holy Land," etc.

CROWN 8VO, CLOTH, BEVELED EDGES, \$2.00

It abounds in pleasant episodes, charming and vig-
orous descriptions of scenery and character, is distin-
guished by a refined wit, a droll humor, a strong love
of the beauties of nature, and an enthusiastic devotion
to the piscatorial sport. This book will please all who
admire heartiness of style and exuberance of anima-
spirits in their authors. There are some interesting
and well-told stories scattered through the volume,
which exhibits on almost every page the handiwork of
a man of graceful culture and wide reading.—*Boston

FOREST AND STREAM,

A WEEKLY JOURNAL.

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Co.,
103 FULTON STREET, NEW YORK.

Terms, Five Dollars A Year, Strictly in Advance. A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over one month, a discount of 10 per cent. will be made; over three months, 20 per cent.; over six months, 30 per cent.

The object of this journal will be to studiously promote a healthful interest in outdoor recreation, and to cultivate a refined taste for natural objects. We especially desire to make the FOREST AND STREAM the recognised medium of communication between amateurs and professional sportsmen. All of us have something to impart, which if made available to each other, will in time render us proficient in all those several branches of physical culture which are absolutely essential to our manhood and well-being, both as individual men and as a nation. A practical knowledge of natural history must of necessity underlie all attainments which combine to make a thorough sportsman. It is not sufficient that a man should be able to knock over his birds dexterously right and left, or cast an inimitable fly. He must learn by study and experience the haunts and habits of the game or fish he seeks. If he depend altogether upon his dog's nose, or upon his henchmen, he will some day have to retire from the field in mortification and disgrace. Therefore it is that we shall study to give practical instruction in the most attractive departments of natural history. We shall not forget the technicalities of the craft either, but take pleasure in designing the best localities for hunting and fishing, outfits, implements, remedies, routes, distances, breeds of dogs, &c. Each number will contain a paper descriptive of a particular animal, bird, or fish, with some instruction as to its habits, haunts and mode of capture, and the period when it is in season. We have arranged to receive regular weekly reports of the fishing and shooting in various parts of the country.

Yachting and boating will be encouraged, and yacht news be made an especial feature of the paper. A reasonable space will be given to athletic sports and those out-door games in which ladies can participate. In a word, every description of game that is in vogue among respectable people, and of value as a health-giving agent or recreative amusement, will be considered and its practice encouraged. Nothing that demoralizes or brutalizes, nothing that is regarded as "sport" by that low order of beings who, in their instincts are but a grade higher than the creatures they train to amuse them, will find favor in these columns.

To horse news we shall devote some space, giving a record of leading races and meetings and current events, but we shall not make it a feature of this journal. We leave this department to others, much more competent than ourselves, who are recognised throughout the country as exponents of the turf, and as authority in stock, pedigree and kind. We yield to no one, however, in our love and appreciation of the horse and his estimable qualities. The noblest of all animals, and the companion alike of men of high and low degree, he has never become contaminated by the moral atmosphere by which he is often surrounded, or degraded below the high rank to which his attributes entitle and assign him.

To the forest, lawn and garden we assign full place. For the preservation of our rapidly diminishing forests we shall continually do battle. Our great interests are in jeopardy—even our supply of drinking water is threatened, from the depletion of our timberlands by fire and axe. It is but proper to state here that the gentleman in charge of this department is the well-known "Olipod Quill," who was connected with the *Agriculturist* newspaper from the start, and a co-laborer with the lamented Downing for many years. Much valuable information will be found in this department.

Our military department is intended to comprise merely a weekly summary of news for officers and soldiers upon the frontier—such news as the castaways would enjoy to receive in a "letter from home;" and we trust that many of them will be inclined to send us in return some account of their hairbreadth experiences among the Indians, the buffaloes, the grizzlies and the antelopes. We of the East are not thoroughly familiar with the varied species of game in the far Northwest, and would like to receive full information especially of the numerous *Cervus* family and of the Rocky Mountain sheep. This department is under the charge of a distinguished army officer.

Our dramatic and art column will be prepared by Colonel T. B. Thorpe, and must at once become popular with all our readers who are interested in these matters. We shall occupy an independent position, and throw our efforts in behalf of competent reform. We shall perhaps even clamor for it.

Our columns will always contain the cream of the latest foreign sporting news.

In a word, we are prepared to print a *live* paper and a useful one. We shall not be parsimonious in securing the best material for its columns. We are convinced that there is a standard of eminence and usefulness not yet fully attained by any sporting journals in this country. To this we aspire. It will be our ambition to excel; and we have relinquished a life of ease and semi-indolence to take charge of the enterprise. This not of our own free choice, but at the solicitation of many hundreds of friends and strangers. We are ably assisted in our labors by a corps of valuable associates—men of age and experience, all of whom, with single exception, have been identified with leading journals for years.

Mr. SIMEON A. ATKINSON, connected with the Georgia press for over twenty years, has charge of the business affairs of the Company.

CHARLES HALLOCK, Managing Editor.

PICTURED AUTUMN LEAVES.

Gay autumn leaves! we have seen you blending
Your irised pennons in shadowy vale,
And gather new glory upward wending,
In the savage north-wind's trail,
From the mountain's base
To its crested space,
Where the burning hues prevail!

O, green and yellow and crimson and gold,
Out of the loom of the Infinite rolled,
In wild luxuriance, fold upon fold!
We are lost in half tearful wonder
That the wintry wind, which is blatant and bold,
Your blushes should deepen, your life infold,
Till, chilled to the heart by a love that is cold,
You shrivel and die in russet mould,
And are buried the deep snows under!

Fair autumn leaves! Can we wake rejoicing
To loveliness doomed of its birth to pale?
Can we echo the melody of your voicing,
Not moved by its latent wail,
That sighs for aye
Through the bright array
Grim Death must countervail?

Yet, crimson and gold and yellow and green,
Hush your low murmurs! for I have seen
A power that is subtle and strong and keen
To bear you across Time's river,
Where ashen garments never demean
The radiant form of autumn's queen,
But on through the ages of aureate sheen,
Bating no jot of her royal mien,
She gorgeously glows forever.

Glad autumn leaves! this benison lingers
(Lifting you over life's wintry wave)
In the heaven born touch of the artist's fingers,
Whose passionate soul can save,
By the wondrous skill
Of a master's will,
Fair forms from a waiting grave.

So, green and yellow and crimson and gold!
Your emerald, topaz and ruby unfold,
Dreading no robber king withered and old
Shall bid you your grace surrender.
Nay—flames that the wind and the sunshine hold,
Till they joyously spread over wood and wold
(In diaphanous haze of a wealth untold),
Blaze on in your beauty, by naught controlled,
For art's seal is set on your splendor!

—October Galaxy.]

MARY B. DODGE.

CBEEDMOOR PRIZE CONTEST.

MATCH OF THE NATIONAL RIFLE ASSOCIATION.

HISTORY OF THE RANGE—SCORE OF THE MATCHES—NAMES OF THE VICTORS—ANALYSIS.

THERE has just been completed at Creedmoor the first annual Prize Meeting of the National Rifle Association, twelve competitions having taken place, the full and correct statements of which will be found at the conclusion of this article. Though Creedmoor may be now well known to our National Guard and riflemen in the city and vicinity, still a thorough description of the same, its plan of organization, and the object to be obtained by having such a range for rifle practice in our midst, with full details of methods of shooting, &c., may be of interest to many outside of the city, and may help to develop more thoroughly a taste for rifle shooting in the United States.

The initial movement for the organization of a National Rifle Association dates from November 24th, 1871, when a Board of Directors were elected with the following officers: President, A. E. Burnside; Vice-President, Col. Wm. C. Church; Secretary, Capt. G. W. Wingate; Corresponding Secretary, F. M. Peck; Treasurer, J. B. Woodward. This same organization held office until July 22d, 1872, when General Burnside having resigned, Colonel Church was elected president, with General Alex. Shaler as vice-president. Now the real labors of the Association commenced,

such as the choice of a proper sight for a range and the details necessary to get members of the National Guard to take an interest in what to them was a novel enterprise. It was soon evident that the high price of land within any available distance of New York, would render any purchase impossible without State assistance. A bill was introduced into the Legislature, which was passed in May 1872, which provided that whenever the Association should raise \$5,000 the State would contribute \$25,000 for the purpose of purchasing and fitting up such a range, the State also agreeing to provide division and State prizes for skillful marksmanship. To this amount was added \$5,000 from the Supervisors of New York and Brooklyn, with \$5,000 more from the Supervisors of New York.

The work of selecting the grounds of a sufficient extent for a range, which should be at once reasonable as to price of land, safe and convenient of access, was a difficult task. Finally a most wise purchase was made of a tract of seventy acres, situated on the Central Railroad of Long Island. This land was bought of Mr. J. Creed for \$26,250, and named Creedmoor. These grounds are admirably adapted for the purpose for which they have been selected. As level as a billiard table, they afford room for twenty separate ranges, each of which can be used from one hundred to a thousand yards and without the use of elevated firing-stands, found necessary upon most European ranges. There was only one slight objection to the range, and that was that it would become necessary to build an embankment of twenty feet high and five hundred and seventy feet long, to place back of the butts, which would require some 27,000 cubic yards of earth. The Association very wisely sent Messrs. Rockafellar, Wingate, and Church to Wimbledon and Hythe, who made a thorough inspection of the rifle practice as carried on there, and who selected all the latest improvements.

THE MATCH.

The first annual meeting of the National Rifle Association, which took place on Wednesday, Thursday, Friday and Saturday of last week, marks an important era. It may be considered as the dividing line in the progress of the National Rifle Association, and the success that was attained renders the future prospects of the Association no longer doubtful.

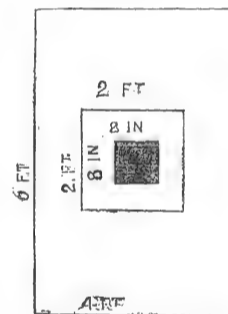

The practice of marksmanship is one that appeals strongly to our young men. It is free from all those demoralizing influences which are associated with many other manly sports, and it requires, above all things, a clear eye and a steady hand and consequently a life free from dissipation. To members of the National Guard it affords a gratifying change from the everlasting "fours right" and the "manual of arms," which make their drills so tedious, and by affording a chance for a display of individual skill, puts each man upon his metal.

At first the Association experienced no little difficulty in inducing the National Guard to interest themselves in the subject of rifle practice. A few of the leading officers, prominent among whom were the Adjutant General of the State, and Major Generals Shaler and Woodward, have done all in their power to induce them to take hold of the matter, but many of the other officers have displayed an astonishing apathy.

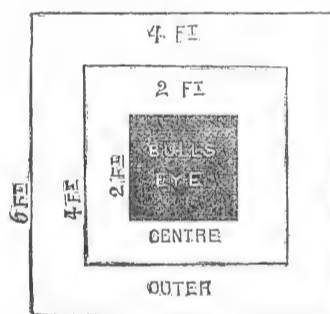

The liberal action of the Association in throwing open their range for the gratuitous use of the National Guard during the past summer resulted in most of the regiments going there for a day's practice, and after a single visit it soon became popular. "Teams" were formed from almost every regiment, and the practicing has been incessant, so that during September alone the range was used by nearly 4,000 men. Emulation has been excited, and all are striving to excel.

The shooting in the different matches of the last week will do much to strengthen the popularity of the range, and it shows the vast improvement that has resulted from the better practice of the men, and thus puts all upon their metal for the next contest. It is also very important as bringing the Regulars and the National Guards in close contact, in which certainly the latter have not suffered.

Creedmoor, on the Central Railroad of Long Island, is eleven miles from Hunter's Point, and a short distance from Jamaica and Flushing. It is reached in one hour from James Slip, and three quarters of an hour from Thirty-fourth street. On alighting from the cars a walk of 200 yards up a broad avenue brings you to the southern extremity of the range. From this point it extends eleven hundred yards, a perfectly level field, interspersed here and there with large trees, and altogether containing seventy acres. Across the northern boundary an embankment twenty-five feet high has been erected, at the base of which twenty targets are placed, each being thirty feet from centre to centre. They are all available for simultaneous use up to 500 yards, and the majority of them up to 1000 yards. The targets themselves are composed of heavy slabs of cast-iron, two feet wide by six high, which are bolted together to form the required size; two slabs making the target used up to 300 yards, three that used up to 600 yards, and six that used over that distance. Each target has a square black bull's eye painted upon it surrounded by a line indicating the "centre," the remainder of the target constituting the "outer," the size being as follows:

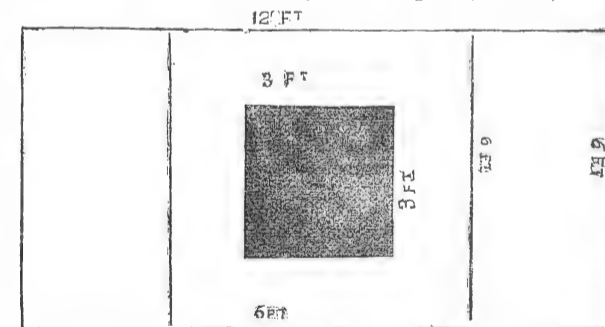

Third Class.

Second Class.

Third class used up to 300 yards, (in off-hand firing); target 6 feet by 2; bull's eye, eight inches square; centre 2 feet. Second class used from 300 to 600 yards, any position; target 6 feet square; bull's eye 2 feet square; centre, 4 feet.

First Class.

First class used over 600 yards; any position; target 6 feet high, by 12 wide; bull's eye, 4 feet square; centre, 6 feet.

In all cases shots striking the bull's eye count four; centres three, outers two. Scores are counted the same all ranges, so that when we read that a marksman made, in five shots, 19 out of a possible 20, he must have made four bull's eyes, or sixteen, and one centre, three more, which would score 19. For instance, General Hawley, in the Press match, made 36 in a possible 40 in ten shots, which was made up as follows: of six bull's eyes and four centres, 24 and 12.

The marking is upon two systems. In the "Hill" or side butt, the marker is placed in a shot-proof hut and marks from a slit cut in the side; in the "Scoble" or sunken butt, he is placed in a trench dug in front of the target, and marks through a trap in the roof.

The latter plan is found by far the best, and the Association are converting all their targets into that mode as fast as possible. It admits of a supervision being kept over the markers, lessens the danger of accident, and removes the annoyance of the target being overshadowed, the latter being a serious draw-back which, in the morning and evening prevented a number of targets from being used during the match.

Each marker is provided with three discs, each 18 inches in diameter fastened upon a pole about eight feet long. One side of the disc is pointed, and the other has attached to it at right angles a sash brush charged with paint. When a shot strikes the target it makes a large star upon the point with which it is coated. The noise of the shot calls the attention of the marker (who is watching the target through a thick plate glass window). He at once opens his trap and placing the proper disc over the shot mark, obliterates it with the brush, at the same time the color of the disc signals to the firer the value and exact position of his shot, a white disc signifying a "bulls," a red one, a "centre," and a black one, an "outer."

The targets are divided into sets of five, each under the control of a Superintendent, a commanding officer having control of a similar number of firing points, both target and firing point being distinguished by a large number conspicuously displayed. If one of the latter officers has reasonable cause to believe that during firing a hit had not been signalled at all, he "calls the target" upon the telegraph, by tapping its number. At once the danger flags were displayed at that and the three targets adjoining upon each side, (the firing at which at once stopped) and the Superintendent came and examined the target. If he found it hit he signalled it, if not (as in nineteen times out of twenty was the case) he simply waived his hands and returned to his cover.

The management of the firing was under the control of the range officer, Captain George W. Wingate. Under his orders at the butts were twenty markers, (regulars from Willet's Point engineers), and four superintendents, and at the firing points twenty score keepers, (men employed and paid by the Association), and four superintendents (volunteers from the National Guard). He was expected to answer all questions, decide all disputes, and generally "to run the machine," and emphatically had his hands full.

The headquarters department was under the direction of General John B. Woodward and a staff of clerks, and was managed with great efficiency. Each man upon entering for any match received a ticket having upon it his name and number.

This he took to the proper firing point at the hour named, and presented it to the register keeper, who placed it in a tin frame with those belonging to the rest of the squad assigned him. When all was ready a cannon was fired. At this the markers retired to their butts and withdrew their danger flags. At a second gun the firing commenced, the members of the squads being called by twos (unless using muzzle loaders, when they fired individually), who fired their shots alternately, until their score was completed.

In some of the matches only military rifles were allowed; in others any rifle within the rules of the Association—i. e. not weighing over ten pounds, nor with a trigger under three pounds pull, nor with telescopic sights. In the latter class of matches almost every kind of rifle was used, from the elaborately sighted muzzle-loading Metford, used by the Canadians, to the Remington military rifle of the National Guardsmen, including the Remington, Sharpe, Ballard, Allen, and other well known sporting rifles. Up to 500 yards, however, it was astonishing to see how closely the military weapon kept up to the others.

Thus in the final match (200 yards off-hand) with a military rifle, the winners' scores were: W. Robertson, 16; J. T. B. Collins, 16; G. A. Strube, 16; Campbell Vail, Richards, Gildersleeve, and Price each 15; while in the Sportsmen's match, at the same distance, with sporting rifles, the score was no greater, Schneelock, Robertson, Collins, Waterbury, and Anderson making 16, and Meserole and Backer 15. At 500 yards the highest scores made with a military rifle, even out of a possible 28, Carmichael, 24; Strube, 23; Cocks, Hitchcock, Lockwood, Boehr, and Murphy, each 21; while the highest with a sporting rifle, at 500 yards, out of a possible 28, Richards and Yale, 26; Omand and Campbell, 25; Adam and Sanford, 23; Tolley and Anderson, 22, and Ready, 21.

At the longer ranges the qualities of the finer rifles of course gave them greater advantages. This match also demonstrated the great improvement that had been made in breech-loaders. The score at 800 and 1,000 yards showed but little difference between the breech-loading Rigby and Metford rifles, and the breech-loading Remington, Sharpe, and Maynard.

Wednesday the wind was high and "flaw," and the off-hand shooting in consequence below the average. Toward the afternoon the wind moderated somewhat, and the shooting improved in proportion. Thursday there was less wind, especially toward the afternoon, and the firing became very good, particularly in the All-comers match.

The scene on Thursday was very inspiring. The long line of National Guardsmen in their bright uniforms, with the crowd of spectators, the white targets showing brightly against the green embankment, the beautiful weather, and the strains of the regular band from Willet's Point, made the scene quite picturesque.

SCORE OF THE MATCHES.

COMPETITION I—OPENING MATCH—JUDD PRIZE.

Offered under resolution of Board of Directors, N. R. A., to commemorate the services rendered by Hon. David W. Judd in securing the passage of the law by which the Association were enabled to secure their range. Open to all members of the Association. Weapon, any military rifle; distance, 200 yards; position, standing; five rounds; entrance fee, \$1.00; number of entries, 96.

Prize.	Name.	Total.	Rifle.
1... Silver Cup.	W. Robertson, 79th Infantry.	3 3 3 4—16.	Remington.
2... Silver Medal.	J. T. B. Collins.	3 3 4 3—16.	Remington.
3... Life Membership N. R. A.	G. A. Strube, 22d Infantry.	3 2 4 3—16.	Remington.
4... Bronze Medal.	Lt. Campbell Vic. Rifle Montreal.	3 3 2 3—15.	Snider Enfield.
5... Bronze Medal.	Sergt. Vail, 9th Infantry.	3 3 2 4—15.	Remington.
6... Bronze Medal.	L. P. M. Richards, 7th Infantry.	3 3 3 4—15.	Remington.
7... Bronze Medal.	Lt. Col. Gildersleeve, 12th Infantry.	3 4 2 3—15.	Remington.
8... Bronze Medal.	J. L. Rice, 7th Infantry.	4 2 4 3—15.	Remington.

The score here is quite good for military rifles. It must be remembered that a gale of wind was blowing, which renders the best of shooting uncertain.

COMPETITION II—SPORTSMEN'S MATCH.

Open to all comers; weapon, any rifle; distance, 200 yards; five rounds; position standing; number of entries, 129; entrance fee, \$1.00.

Prize.	Name.	Total.	Rifle.
1... Metford Rifle.	O. Schneelock, 32d Infantry.	3 3 3 4—16.	Remington.
2... Moose Antlers.	A. Robertson, 12th Infantry.	3 4 3 3—16.	Remington.
3... Silver Medal.	J. T. B. Collins.	3 4 3 3—16.	Remington.
4... Life Membership N. R. A.	C. B. Waterbury, 12th Infantry.	4 3 3 3—16.	Remington.
5... Bronze Medal.	A. Anderson, 4th New Jersey.	4 2 4 3—16.	Winchester.
6... Bronze Medal.	General J. V. Meserole, 11th Brigade.	3 3 3 3—15.	Maynard.
7... Bronze Medal.	Leon Backer, 22d Infantry.	3 3 3 3—15.	Rem. Mil.

This score is not quite as high an average as might have been expected, but as the wind was blowing hard, and from all points of the compass, this probably accounted for the low score. Mr. A. Robertson, with 16, won the moose antlers presented by the FOREST AND STREAM.

COMPETITION III—FIRST DIVISION MATCH.

Open to "teams" of twelve from each Regiment or Battalion in the First Division of the National Guard, S. N. Y. All competitors to appear in uniform (full dress or fatigue), and to be certified by their Regimental Commander to be regularly enlisted members in good standing of the Regiment they represent, and to have been such on August 1, 1873, as required for the State Prize. Weapon, Remington Rifle, State model; distance 200 and 500 yards; five shots each distance; position, standing, at 200 yards; any position at 500 yards; entrance fee, \$1.00 each man; number of teams entering, eight.

Prize.	Name.	At 200 yds.	At 500 yds.	Total.
State Division Prize.	Best team.	22d Regt. Inf'y, N. Y.	—155.	—108.
Shaler Medal.	Best individual score.	Private Cocks, 23d.	—14.	—15.
Silver Cup.	2d best team.	12th Regt., N. Y.	—134.	—101.
Silver Cup.	3d best team.	9th Regt., N. Y.	—142.	—68.
Silver Medal.	2d best individual score.	Sergt. Wood, 12th Inf'y.	2 2 2 3 3—12.	3 2 4 3 4—16.
Life Membership N. R. A.	3d best individual score.	Lieut. Col. Gildersleeve.	2 3 2 2 3—12.	3 4 3 3 2—16.
Bronze Medal.	4th best individual score.	Sgt. Maj. Roux, 22d.	3 3 3 3 3—15.	2 3 3 3 3—13.
Bronze Medal.	5th best individual score.	Sgt. Freeman, 22d.	3 3 3 3 4—15.	3 3 3 3 2—13.
Bronze Medal.	6th best individual score.	Drum Maj. Strube, 22d.	3 3 3 2 3—13.	3 4 2 4 4—14.
Bronze Medal.	7th best individual score.	Private Smith, 12th.	3 2 2 2 3—12.	2 3 2 3 4—14.
Bronze Medal.	8th best individual score.	Private Robertson, 79th.	3 4 2 4 3—16.	2 0 4 0 3—9.
Bronze Medal.	9th best individual score.	Private Backer, 22d.	2 3 2 3 2—12.	2 3 3 2 2—12.

Average of best team, 2 23-100, which is quite commendable.

COMPETITION IV—SECOND DIVISION MATCH.

Open to teams of twelve from each regiment or battalion of the Second Division of the National Guard, N. Y. S., upon the same condition as prescribed for the preceding match. Weapon, Remington Rifle, State model; distance, 200 and 500 yards; five shots each distance; position, 200 yards, standing; 500 yards, any position; entrance fee \$1.00 each man; number of entries, five.

Prize.	Winner.	At 200 yds.	At 500 yds.	Grand Total.
State Division Prize.	Best team.	23d Regt., N. Y.	—125.	—54.
Woodward Prize.	2d best team.	32d Regt., N. Y.	—125.	—53.
Silver Cup.	3d best team.	28th Regt., N. Y.	—107.	—43.
Silver Medal.	Best individual score.	Capt. Lutz, 32d Inf'y.	4 3 4 2 2—15.	2 3 3 2 2—12.
Bronze Medal.	2d best individual score.	Sgt. Battenhausen, 32d.	3 2 3 3 4—14.	2 4 2 4 2—12.
Bronze Medal.	3d best individual score.	Sgt. A. Bunce, 32d.	2 2 2 2 2—10.	3 0 4 0 2—13.
Bronze Medal.	4th best individual score.	Private Corrie, 14th.	2 3 2 3 2—12.	2 0 2 3 3—10.
Bronze Medal.	5th best individual score.	Private Schneelock, 23d.	2 4 2 2 2—12.	3 0 2 3 2—10.
Bronze Medal.	6th best individual score.	Private Holton, 13th.	3 0 3 4 2—12.	2 3 3 2 0—10.

COMPETITION V—ARMY AND NAVY JOURNAL MATCH.

Open to teams of twelve from all regularly organized military organizations in the United States, including the Regular Army, Navy and Marine Corps. All competitors to be regularly enlisted members in good standing of the regiment they represent, and to have been

such on August 1, 1873, and to appear in uniform, (full dress or fatigue.) Weapon, any military rifle; distance, 500 yards; rounds, seven; entrance fee, \$1, each competitor; number of entries, nine, from the Ninth, Twelfth, Thirteenth, Fourteenth, Nineteenth, Twenty-third, Seventy-ninth, N. Y. N. G., and U. S. Engineers, Regulars.

Prize.	Best team.	Winner.	Total.	Rifle.
Silver Trophy.	2d best team.	22d Regt. N. G. S. N. Y.	—211.	Remington.
Silver Cup.	3d best team.	79th do do	—152.	Remington.
Silver Medal.	Best individual score.	Private Carmichael, 22d.	2 4 4 4 4—24.	Remington.
Life Membership N. R. A.	2d best individual score.	Drum Major Strube, 22d.	0 4 4 4 4—24.	Remington.
Bronze Medal.	3d best individual score.	Private Cocks, 22d.	3 3 3 2 4—21.	Remington.
Bronze Medal.	4th best individual score.	Lt. Col. Hitchcock, 9th.	3 3 4 3 3—21.	Remington.
Bronze Medal.	5th best individual score.	Private Lockwood, 22d.	3 4 3 2 3—21.	Remington.
Bronze Medal.	6th best individual score.	Private Backer, 22d.	3 4 3 2 3—21.	Remington.
Bronze Medal.	7th best individual score.	Adj't. Murphy, 12th.	2 4 4 4 2—21.	Remington.

*The silver trophy, presented by the "Army and Navy Journal," to be won three times before becoming the property of the winning regiment.

†Average of the Twenty-second Regiment team, 2 33-84; which is very good.

‡Private Carmichael's score 24, in a possible 28.

COMPETITION VI—ALL-COMERS' MATCH.

Open to all comers; any rifle; distance, 500 and 600 yards; seven shots each distance; position, any; entrance fee, \$1.00; number of entries, seventy-five.

Prize.	Winner.	At 500 yds.	At 600 yds.	Total.	Rifle.
Wesson Combination Rifle.	R. Omand.	3 3 4 3 4—25.	2 3 4 3 4—24.	49.	Remington.
Silver Medal.	J. P. M. Richards, 7th.	4 4 3 3 4—26.	2 4 3 4 4—23.	49.	Sharp.
Life Membership N. R. A.	Lt. Campbell, Montreal.	4 3 4 3 4—25.	4 3 3 3 4—23.	48.	Metford.
Bronze Medal.	J. Adam.	3 4 3 3 4—23.	3 4 3 4 3—21.	47.	Rigby.
Five Dollars.	E. H. Sanford.	2 4 3 4 4—23.	3 4 3 2 4—22.	45.	Sharp.
"	J. W. Yale.	3 4 4 3 4—26.	0 3 3 4 3—19.	45.	Sharp.
"	H. Tolley.	3 4 4 3 4—22.	4 3 3 4 3—22.	44.	Maynard.
"	H. Fulton.	0 2 3 4 3—19.	4 3 3 4 3—24.	43.	Maynard.
"	A. Anderson.	3 2 4 4 3—22.	2 4 2 4 3—21.	43.	Sharp.
"	W. C. Reddy.	2 3 3 3 4—21.	2 3 3 4 3—21.	42.	Sharp.

*R. Omand's average of 33, total 49, in a possible 56, is remarkably good.

†J. P. M. Richards' was also good, though he lost because his shooting at 600 yards was less than that at 500; he also made 49.

COMPETITION VII—STATE PRIZE.

Open only to teams of twelve from each regiment or battalion of the National Guard of the State of New York, each being certified to by their Regimental Commander to be a regularly enlisted member in good standing of the regiment he represents, and to have been such on August 1, 1873. They shall appear in uniform (full dress or fatigue.) Distance, 200 and 500 yards; position, standing, at 200 yards; any at 500; weapon, Remington Rifle, State model; rounds, five; entrance fee, \$1.00 each man; fifteen teams entered.

Prize.	Winner.	At 200 yds.	At 500 yds.	Total.
Silver trophy.	22d Inf'y, N. G. S. N. Y.	155.	125.	280.
Rathbone Medal.	Best individual score.	Private Backer, 22d.	16.	15.
	1st regiment, 12 men.	C. Zettler.	13.	9.
	8th regiment, 12 men.	F. W. Hofel.	12.	24.
	9th regiment, 12 men.	Lt. Col. Hitchcock.	14.	12.
	12th regiment, 12 men.	W. S. Smith.	12.	16.
	13th regiment, 6 men.	W. J. Denslow.	8.	11.
	14th regiment, 12 men.	J. L. Corry.	11.	15.
	19th regiment, 12 men.	J. McLean.	12.	16.
	22d regiment, * 12 men.	Leon Backer.	16.	15.
	23d regiment, 12 men.	S. J. Kellog.	14.	15.
	28th regiment, 7 men.	Captain Schweizer.	11.	12.
	32d regiment, 12 men.	Captain Lutz.	15.	13.
	69th regiment, 12 men.	Captain Collins.	14.	28.
	71st regiment, 2 men.	Sgt. Waring.	10.	2.
	79th regiment, 12 men.	Captain Clark.	17.	13.
	84th regiment, 12 men.	Drum Major Nulte.	11.	8.
Silver cup.	2d best team.	12th regiment, N. G.	155.	98.
	3d best team.	79th regiment, N. G.	144.	108.
Life Membership N. R. A.	2d best individual score.	W. J. Carmichael, 22d.	17.	14.
Engraving.	3d best individual score.	Sgt. Mayner, 22d.	14.	16.

*The average of the 22d regiment, 24—making 280—is very good.

†The score of Captain Clark, of the 79th—making thirty individually, an average of three centres—is remarkably good.

COMPETITION VIII—THE GATLING MATCH.

Open to teams of twelve from each regiment or battalion of the National Guard of the State of New York. All competitors to appear in uniform, and to be certified to be regularly enlisted members in good standing of the regiment they represent, as required for the State Prize. Weapon, Remington Rifle, State model, distance, 500 yards; rounds, seven; position, any; entrance fee, \$1.00; entries, seven.

Prizes.	Winner.	Total.
Gatling gun.	79th regiment.	—199.
Silver cup.	2d best team.	—184.
	3d best team.	—176.
	Best individual score.	Captain James Ross, 79th.
Life Membership N. R. A.	2d best individual score.	Sgt. Major Roux, 22d.
Bronze Medal.	3d best individual score.	Private Keeler, 79th.
"	4th best individual score.	Sgt. Frothingham, 23d.
"	5th best individual score.	Lt. Col. Gildersleeve, 12th.
"	6th best individual score.	Stevenson, 79th.
"	7th best individual score.	W. J. Cudlipp, 12th.

*The 79th, making 199, an average of 2 31-84, is quite good.

†Captain Ross' score of 24, in a possible score of 28, was excellent.

COMPETITION IX—NEW JERSEY MATCH.

Open to teams of twelve from each regiment of the National Guard of the State of New Jersey, each being certified to have been on August 1, 1873, a regularly enlisted member in good standing of the regiment he represents, and to appear in uniform, (full dress or fatigue.) Distance, 200 and 400 yards; five rounds each distance; position, standing at 200, any at 400 yards, weapon, such rifle as shall be prescribed by the Governor of New Jersey; entrance fee, \$1.00; number of entries, two; the First and Fourth Regiments.

Prizes.	Winner.	At 200 yds.	At 500 yds.	Total.
Silver trophy.	Best team, 4th regiment.	—	—	179.
Gold Badge.	Private Scott, 4th Inf'y.	3 3 2 4 2—14.	2 2 3 3 2—13.	27.
Silver Medal.	Captain Abernethy, 4th Inf'y.	3 3 3 2 2—13.	4 3 3 3 0—13.	26.
Bronze Medal.	Private Anderson, 4th Inf'y.	2 3 3 2 2—12.	2 2 4 2 3—18.	25.

COMPETITION X—RAILROAD MATCH.

Offered by Herman C. Poppenhusen, Esq., on behalf of the Central Railroad of Long Island. Open to members of the National Rifle Association and competitors in the foregoing matches, but excluding all winners therein, and all winners of the Turf, Field and Farm and Amateur Club Badges. Distance, 500 yards; weapon, any military rifle; position, any; rounds, seven; one hundred and seven entries.

Prize.	Winner.	At 500 yds.	Total.	Rifle.
Silver trophy.	Sgt. Wagner, 22d regiment.	4 3 4 2 3 4—24.	4 3 4 3 3—23.	Remington Military.
"	A. V. Canfield.	3 4 3 4 3 3—23.	3 3 3 4 0—20.	41 Rigby.
"	Bethel Barton.	2 3 4 3 4 3—23.	3 2 4 3 3—21.	39 Rem. S.
"	Sgt. Smith, U. S. E.	3 2 4 3 4 3—23.	3 2 3 3 2—15.	37 " "
Cash, \$25.	J. T. Joslin.	4 4 3 2 4 2—23.	4 4 0 0 2—12.	34 " "
" 20.	Gov. Hawley.	4 4 2 2 3 2—22.	3 3 2 3 2—21.	34 Martini Henry.
Silver Medal.	F. Werner.	3 4 2 3 3 2—21.	3 4 2 3 2—21.	Remington Military.
Railroad ticket for 1,000 miles.	Lieut. Horsfall, 22d regiment.	3 4 2 3 3 4—21.	3 4 2 3 4—21.	Remington Military.
Cash, \$5.	Thomas Lloyd.	2 4 2 3 4 4—21.	2 3 3 2 4—20.	Sharp.
" 5.	A. S. Farle.	2 3 3 2 4 4—20.	3 4 2 2 2—20.	Remington.
" 5.	Sgt. Kessam, 19th regiment.	3 4 2 2 3 2—20.	3 4 2 2 3—20.	Remington.
" 5.	M. V. Hollis.	3 4 2 2 3 2—20.	3 4 2 2 3—20.	Remington.
" 5.	Joseph Edgington.	3 4 2 4 3 2—20.	3 4 2 3 0—20.	Sharp.
" 5.	G. Crouch.	4 3 3 3 0 4—20.	3 4 2 3 0—20.	Sharp.

*Sergeant Wagner's score—24 in a possible 28—is very fine shooting. In fact, all up to twenty-one may be considered as very much above the average.

COMPETITION XI—SHARPSHOOTERS' CHAMPIONSHIP.

Open to all comers; any rifle within the rules of the Association; range, 800 and 1,000 yards; seven shots each distance; position, any; entrance fee, \$1.00.

Prize.	Winner.	At 800 yds.	At 1,000 yds.	Total.	Rifle.
Gold Badge.	J. Adam, Canada Volunteers.	4 3 3 4 3 4—25.	4 3 3 4 3—23.	48.	Rigby.
Pipe.	A. J. Roux, 22d regiment, N. Y.	3 4 3 4 3 2—21.	3 3 3 4 0—20.	41.	Rigby.
Silver Medal.	R. Omand, Amateur Rifle Club, N. Y.	4 3 3 4 4—26.	3 3 2 0 3—13.	39.	Rem. S.
Life Mem. N. R. A.	H. Fulton, Brook'n, Am. Rifle Club, N. Y.	2 2 3 3 4—22.	0 2 3 3 2—15.	37.	" "
Bronze Medal.	L. L. Hepburn, Amateur Rifle Club, N. Y.	3 3 3 4 2 3—22.	4 4 0 0 2—12.	34.	" "
Ten Dollars.	Lieut. Campbell, Victoria Rifle, Montreal.	3 4 3 3 3 3—23.	0 3 0 3 0—11.	34.	Metf'd.
"	G. W. Yale, Hartford, Conn.	4 3 4 3 4 2—24.	0 2 0 2 0—7.	31.	Sharp.
"	J. R. Hawley, Hartford, Conn.	4 2 3 2 0 2—15.	3 3 4 0 0—13.	28.	Sharp.
"	J. Carmichael, 22d regiment, N. Y.	4 3 4 0 3 3—20.	0 2 0 3 0—8.	28.	Metf'd.

COMPETITION XII—PRESS MATCH.

Open to representatives from any regular newspaper or periodical, each to be required to be a bona fide employee thereof. Weapon, any rifle; distance, 400 and 500 yards; position, any; rounds, five each distance; entrance fee, none.

There had been considerable interest taken in this match, and representatives from the following papers, had entered: FOREST AND STREAM, Army and Navy Journal, Turf, Field and Farm, Harper's Weekly, Daily News, Evening Mail, Commercial Advertiser, Brooklyn Daily Times, N. Y. Sun, N. Y. Tribune, Herald, British Whig, Kingston, Ontario; Irish American, Newark Helvetia. There were only twelve contestants.

Prize.	Winner.	At 400 yds.	At 500 yds.	Total.
Ice Pitcher.	Ex-Gov. J. R. Hawley, Hartford Courant.	4 4 3 3—18.	4 3 4 3—18.	36.
Silver Medal.	W. H. Clark, Daily News.	3 4 2 2—15.	3 4 2 4—16.	31.
Bronze Medal.	L. C. Brice, Turf, Field and Farm.	2 3 0 2—10.	4 4 2 2—17.	27.
"	Thomas Lloyd, Harper's Weekly.	3 2 3 4—15.	2 0 2 2—8.	23.
"	C. J. Shanks, New York Tribune.	4 3 3 0—13.	3 0 0 4—7.	22.
Engraving.	J. C. McIntyre, Boston News.	2 2 2 2—11.	0 0 0 3—3.	14.

REMARKS.

It is quite worthy of mention, showing the care that had been taken by the officers of the Association, that not a single accident occurred, and there was scarcely any of that confusion incidental to a first match. If words of praise are by no means out of place in regard to the conduct of the officers, who had many new points raised for their decision, incidental to the opening match, the conduct of the men is also to be applauded. We did not notice a single case of intoxication, nor the least indication of gambling. Some parties were on the grounds early intent on starting "pools," but such requests were promptly denied and squelched on the spot.

Perhaps it would be better next year at the grand national contest to make the time in September. Then the days are longer, and the shooting may be continued for fully nine hours. But very possibly the managers were right in making the match come off at as late a time as possible, in order to give the men the fullest opportunity for practice. It would be wise too to separate in the future all the military contests from those of a more general character, as likely to avoid confusion. Another suggestion we would make, since we want our matches to be as thorough as possible, is that all the meteorological conditions of the day be determined accurately, such as barometrical and theometrical measurements, direction of wind, and the miles in an hour the wind is blowing. From data of this character greater accuracy in shooting must follow.

SHARPSHOOTERS' MATCH.

The sharpshooters' match is one only to be attempted by experts, as at distances over 600 yards, the utmost nicety and skill is required, which can only be obtained by long practice. Members of the Association have practiced but little at long range shooting, and though all the shooting done in this match by our own men was very good, doubtless next year, when they have devoted more time to it, they will show improvement. Mr. Adam's score, 48, an average of 3 1-7, (25 at 800 yards, and 23 at 1,000,) in a possible 56, for such a long range is very good shooting. Mr. Adam, of the Canada volunteers, has already shown his skill in England and Scotland, and is one among the many good Canadian marksmen. We cannot but congratulate Mr. Adam in his victory, and the modesty with which he carried off his well-earned prize. In fact all the Canadians, (there were three winners out of the nine contestants for the sharpshooters' match,) acquitted themselves with credit. Mr. Ormand's score of 26, at 800 yards, five bull's eyes and three centres, is magnificent shooting, better even than his shooting in 1871 at Wimbledon for the Rolapore challenge cup, though he only made 13 at 1,000 yards. In these long ranges, the additional 200 yards makes a vast difference. Mr. A. J. Roux, of the Twenty-second Regiment N. G., N. Y., score 41, (21 at 800, and 20 at 1,000 yards.) is also deserving of most honorable mention, winning as he did the second prize. Mr. Adam shot with a Rigby. Both the Rigby and Metford are muzzle-loading rifles, excellent guns, are loaded with great accuracy, and are furnished with the most carefully adjusted double sights. The least disturbances of the wind are corrected by means of sliding sights. On the whole, the shooting at long range was excellent, and exceeded our expectations. Possibly the beauty of the day, the absence of sun-glare, and there being scarcely a breath of wind, added materially to score-making. We are more than pleased that a brother rifleman from Canada carried off the prize. It will cause a proper amount of emulation, and incite our own men to practice. In this match a very magnificent pipe, presented by Mr. Kaldenberg, came in among the prizes, though not printed in the catalogue of prizes. Mr. Adam was offered his choice of a medal or pipe, and selected the medal. Mr. Roux, having the choice then as second prize of the pipe or silver medal, took the pipe. Mr. Ormand then received the third prize, the medal.

QUESTIONS OF ARMS.

The great use of rifle range is that it must demonstrate whether an arm is good or not. Skill may have a great deal to do with the merit of a high score, but as the weapons used come into the hands of not only experts, but of second and third class shots the use of Creedmoor or any other range must determine the average excellence of any gun. The Remington rifle has been fully tested and has been found to be excellent, not only as a military but as a sporting rifle. In many of the matches, as may be seen on examining the scores, the Remington has held its own with the most delicately adjusted arms. Rifles like the Rigby and Metford have most carefully adjusted sights, were allowances all made for effects of wind blowing across the line of fire, &c. The use of all such adjustments are perfectly in order, and should be encouraged in every way. If a rifle as was remarked by Punch in speaking of the complicated arrangements of the Wimbledon expert, "had a steam engine at one end and a windmill at another," so much the better, if in a range of a thousand yards, the marksman can improve his score a single figure. There is not then the least doubt that when the Remington rifles have adjusted to them these finer sights, that they will not only shoot quiet as well, but possibly out-shoot either the Rigby or Metford. In comparing it as a military arm with the arms used by either the English, French or German, we must declare that it is to be superior as to accuracy. Its penetration was also remarkable, shown by a shot passing through three feet of solid packed dirt, perforating a thick block of wood, and then falling spent with its shape still almost perfect. Subsequent general matches yet to come may bring in prominence some other rifle, when the FOREST AND STREAM will be the first to assert its

claims, but for the present, for all work, we are inclined to think that with a steady hand, and clear sight, whether the marksman be a soldier or a sportsman, the Remington has clearly proved itself the best arm of to-day. The Sharp rifle, especially in the press match, showed its excellence, and is a weapon of great merit. In judging of all rifle contests, our readers not familiar with the subject, should always bear in mind that a windy day always effects the shooting. In concluding our remarks on the first American rifle contest, we believe that the time will come when Creedmoor will be far too small for the concourse of people who will assemble from all parts of the Union, to witness this National pastime.

THE GAME OF COLORADO.

The game of Colorado consists of buffalo, elk, black and white tailed deer, mountain sheep, antelope, cinnamon, black and grizzly bear, wild turkey, sage hen, blue or mountain grouse, willow or pin tail grouse, ptarmigan or mountain quail, ducks of all kinds, except canvas back, geese and brant, swan, curlew, of several varieties; and in the spring and fall snipe and plover for a few days, as they migrate north and south. We have also a few California and State quail imported for breeding purposes.

The following fur-bearing animals are numerous:—beaver, otter, mink, martin, weasel; red, gray, black, and silver-grey fox, beside many varieties that are supposed to be a cross of the different distinct species; also, a very small animal of the fox kind, known here as the swift, the large grey and white timber wolf, white and grey coyote and black prairie wolf, panther or California lion, lynx, wolverine, catamount and wildcat, badger, skunk, ground hog or woodchuck, and other minor species.

The finer fur-bearing animals, such as beaver, otter, mink, martin, etc., are all taken in pole, hole, and steel traps. The wolf, fox, and kindred animals are often poisoned with strychnine, but traps of many descriptions are sometimes employed, and many animals are shot.

Thousands of acres of forest are yearly destroyed by accidental fires, and thousands more are stripped for lumber and wood, but the forests being all in the mountain regions, where the land is of little or no use for other purposes, is allowed to grow up to timber again, so that no estimate of any correctness can be made of its increase or diminution. However, there is no scarcity except in the immediate vicinity of settlements.

Success in either hunting or trapping depends more here than elsewhere upon the experience of the person engaged in it, and his knowledge of the country, for the reason that game is not generally distributed throughout the territory, but certain species are confined to certain localities. No stranger need expect much success unless accompanied by an experienced guide.

Remarkable bags are often made, but create little remark here, as they are mostly made by professional hunters, who prefer the profit to the notoriety that would direct other's attention to their hunting grounds. It is nothing uncommon for two hunters to load a large freight wagon with deer, antelope, or buffalo in a day or two after reaching the hunting grounds. Grouse and such game may be killed at the rate of from one to four or five dozen a day to the gun, provided the hunter has the time and the patience to hunt up their locality.

The larger animals are very extensively hunted during the season for both local and foreign markets. It is estimated that not less than two hundred thousand buffalo were slaughtered for their hides alone last year, and so long as the price of skins make it a profitable business, and the buffalo remain, this waste and destruction will go on.

Were the game laws of the territory enforced all would be well; but except to keep game out of the market during the close season, there is no attempt made in that direction.

The good hunting grounds are so numerous and so widely scattered for the different varieties of game that no very correct idea can be given in such an article except in a general way. Ducks, geese, etc., may be found very close about Denver. Willow grouse are widely distributed, and may be found in most any direction from town by travelling from ten to twenty miles. They are much more difficult to capture, and are a far better bird than the prairie chicken of the States, and are not found in the mountains at all, while the blue or mountain grouse are only found in the mountains, and are the finest eating bird of the grouse kind, but offer poor sport to any except "pot shooters," they being excessively tame. Ptarmigan are only found very close to the snowy range, and are very good for the table, but might as well be killed with a club as shot. Buffalo are sometimes found within thirty miles of town, but usually a ride of from fifty to two hundred miles east, either via the Union Pacific or the Kansas Pacific Railroad, will be necessary for any great success. Antelope are often found within ten miles of this place, but are more plenty as you leave civilization behind in either direction. White tail deer are not plenty. They are only occasionally killed along the water courses and in the low hill country some thirty to fifty miles to the east, and seventy from here. Black tail deer confine themselves to the mountainous regions, except when severe storms prevail; they then come to the foot-hills, where they may be killed in quantities. They afford fine sport, whether in mountain or valley, are very numerous, and are often hunted within twenty miles of town. Bear are distributed throughout the entire mountain country. Mountain sheep are very seldom killed, except on the high mountains, and from twenty-five miles dis-

tant to as far as the Rocky mountains extend. Elk are found most numerous in the Middle and North Forks from seventy to one hundred miles distant, and on the Laramie Plains, and farther west along the line of the Union Pacific Railroad for three or four hundred miles from Cheyenne, especially in the vicinity of Fort Steel, and as far north as the Wind River mountains and Montana Territory.

Very few dogs of any breed are owned here. Some pointers and setters of doubtful blood, and occasionally a grey or stag hound, are kept for running down wounded game; but no fox hounds are in the country, nor could they be used to any advantage on account of the prickly pear, which would cripple them in an hour's run.

Hotel accommodations outside of the principal towns are very limited, and in order to make a success of hunting or fishing it is necessary to take with you transportation, subsistence, and bedding.

In conclusion, if you or any of your friends desire sport, and can stand the fatigue that we all have to endure to find it, come on, and any one familiar with the country will not withhold all information desired, including your obedient servant,

H. A. C.

DENVER, Colorado, October, 1873.

CANVAS-BACK DUCKS IN WISCONSIN.

JANESVILLE, Wisconsin, September 22d, 1873.

EDITOR OF FOREST AND STREAM:—

FOREST AND STREAM is just the paper we have long needed, as an organ for the sportsman and angler. I am happy to see the vacancy so well filled by your interesting publication, which cannot help but be a success.

Our shooting hereabouts is principally confined to ducks, and we claim to have the best ducking grounds in the Northwest, and the only grounds where the famous canvas-back is found in any great number. This ground is at Lake Koshkonong, Wisconsin, a body of water about nine miles long, from two to four miles wide, quite shallow and filled with wild celery. The shores are indented by numerous bogs and sloughs, and lined with a heavy growth of wild rice, and here in the spring and fall are found nearly every variety of water fowl by the million. It has been disputed by Eastern sportsmen that our canvas-backs are the same as are found in the Chesapeake; but that they are the same is true beyond a doubt, and can be proven to the entire satisfaction of all who will come and see. Teal and mallard shooting begin about September first and last until about October. Then comes the canvas-back. Black head, red head, and other northern varieties of ducks, which remain until the lake is closed by ice, and are slaughtered by thousands. Sportsmen in search of ducking grounds would do well to visit Koshkonong, any time from October 10th to November 15th. The best route is via C. and N. W. Railway, Wisconsin Division, from Chicago to Fort Atkinson, 111 miles; thence by team three miles south to Mr. H. L. Beemer's, where good accommodations will be found, and necessary information given. Mr. Beemer lives nearest the best shooting grounds on the lake, and all who stop with him will be well taken care of. The fishing is also very fine, and black bass are taken in great numbers. General Phil. Sheridan took in one day last season all his boat could carry, averaging two pounds apiece.

Yours truly,

VALENTINE.

OLD SUPERSTITIONS.

OLD charms not only effected cures but dealt with every possible relation of life. Thus: "Eat hare if you want to look handsome for nine days after." "Put a hen's heart on your wife's left side while she is asleep, and she'll tell all her secrets." "Swallow a mole's heart, fresh and palpitating, and you'll at once be expert in divination." "Quartan agues yield not to ordinary medicine; so take of the dust in which a hawk has been rolling, tie it up in a bit of white cloth with a red thread, and wear it; or else knock out the right eye of a live lizard, and wear it wrapped in a bit of goat-skin." These are from Pliny, who also teaches that all medicinal herbs should be gathered, pick-pocket fashion, with the right hand poked through the arm-hole of the tunic; you ought to be clad in a white robe, with naked clean-washed feet, and to have just offered an oblation of bread and wine. Worms out of a goat's brain are good for epilepsy; so is a rivet from a wrecked ship, if you insert in it the bone cut out of a living stag's heart, and then make it into a brooch. If you see a shooting star, count quickly, for you'll be free from inflammation as many years as you can count numbers while the star remains in view. To cure cataract in the eye, catch a fox, cut out his tongue, let him go, dry his tongue, and tie it up in a red rag, and hang round the man's neck. When something has got into your eye, rub it with five fingers of the same side as the eye affected, saying thrice, "Tetunc resonco bregam gresso," and spit thrice. If you would escape stomach-ache, take care that you always put on your left shoe first, and wear on gold-leaf the letters L* M* M* R I A, written three times. For toothache, say "Argidam margidam sturgidam" thrice over, and spit in a frog's mouth, solemnly desiring him to take toothache. If any one has swallowed a bone, gently touch the mouth with ring-finger and thumb, and say nine times "I kiss the Gorgon's mouth." This is sovereign; the great Galen himself testifies to the value of charms in such a case. These are from Marcellus Empiricus (the Quack, as he well deserves to be called), who flourished about 380 A. D. But this, from Albertus Magnus, is the most wonderful of all: Gather in August the herb liotropion, wrap it in a bay-leaf with a wolf's tooth, and it will, if placed under the pillow, show a man who has been robbed where are his goods and who has taken them; also, if placed in a church, it will keep fixed to their places the women present who have broken their marriage vow. "This last is most tried and most true."—*All the Year Round*.

THE OLD DRESS COAT.

A PARODY ON GEN. ALBERT PIKE'S "OLD CANOE."

Where cobwebs are thick and ceiling low,
And the dusty floor looks dark below,
Where trunks and boxes in lonely pride
Are gloomily ranged 'round the rough wall side;
Where pictures hang that are old and dim,
Where old hats lay devoid of brim;
Where the past over all in dust is wrote,
Hangs on a nail the old dress-coat.

The well-worn tails are idly dropped,
Like a sea-bird's wing that the storm hath stopped,
And down from the shoulders, one by one,
Hang the threadbare arms whose work is done;
While busily back and forth between
The spiders stretch their silver screen,
And their struggling victims wearily tote
Across the breast of the old dress-coat.

The glossy cloth that a luster gave
Rots slowly away to its hidden grave;
The green mildew creeps o'er its decay,
Hiding the moldering past away
Like the hand that plants o'er the tomb a flower,
Or the ivy that mantles a fallen tower,
While fading colors, once remote,
Throw their somber hues o'er the old dress-coat.

The heaving breasts are dead and still,
But the light winds play with the flaps at will;
And lazily swinging its shabby tail
It floats its length from a rusty nail,
Like a pendulum moving the hands of time,
That meet and part at the noon-tide chime,
And the arms together kindly float,
As if to greet o'er the old dress-coat.

Oh, many a time in the olden day
I've brushed its folds and dust away,
And decked myself for the evening ball,
Where the dance was wild, and love ruled all;
And laughed as I whirled in the giddy dance,
At the girls' sly look and admiring glance,
And felt youth's music's sweetest note,
As I sauntered along in my fine dress-coat.

But now, as I turn from its moldering pride,
And look in the broken glass at its side,
The face that I see is graver grown,
And the laugh that I hear has a sorer tone,
And the form that gave it such graceful swings
Hath bowed 'neath the weight of sterner things;
But I love to think of the happy hours
I danced in my coat 'mid music and flowers,
Ere the steps of time in its rude march smote,
And crushed the pride of my old dress-coat.

—Anonymous.

Among the Birds and Beasts.

YOU are attracted to the place by the outside show. In the bulk windows you see innumerable cages, inhabited by canaries, who hop about within their narrow homes with incessant motion. If you approach nearer to the window, and if your ear is fine and you can separate the noises of Chatham street—muffle, as it were, the rumble of the street car, the din and rattle of the carts and wagons, you will distinguish no end of twitter coming from the establishment in question. Sometimes this chorus, if a streak of sunshine slides into the store, rises in volume of chirps until it sounds like a band of tiny piccolos—then again it ceases, and there comes a clatter, a din of squeaks, saw-edge-sharpening sounds; the parrots taking hand in the bird orchestra. Lured by the sounds—melodious, discordant, or otherwise—and having some business with the proprietor, we enter the bird-store. The twitter is, if anything, a trifle too intense, and as if enraged at our presence, all the parrots commence wrangling, disputing, and objurgating in the most approved primary-meeting manner, until the tympanums of our ears fairly ache.

Mr. Charles Reiche, the Noah of all this ark of birds, welcomes us, and, "wanting to know, you know," we ask no end of questions, to all of which the good natured Noah replies. If Jamrach is the grand wild animal purveyor of England, Mr. Reiche occupies the same position in America.

We watch a couple of assistants packing up most a gross of canary birds, each in a separate cage, going off by express. The cages are all piled one above the other, and a long stick run through the wicker work to hold them together. So tame are the birds that they scarcely flutter. The cages are deftly cleaned, an extra quantity of seed put in the feed cups, their water is replenished, a couple of thick pieces of paper are wrapped around the city of cages, and off they go on their journey. It is mid-day, and they will be in Boston or Cincinnati some time to-morrow, as "fresh as birds," of course, and ready to send forth their sweet carol in, we trust, some gentle lady's drawing-room. If we only could travel this way, and to the same destination!

The canary bird trade, Mr. Reiche informs us, is a constantly increasing one. Twenty-six years ago 1,000 birds in a year was a large quantity of birds to dispose of to-day Mr. Reiche imports and sells 80,000 canaries, and can hardly keep up with the demand. They all come from the Hartz mountains, and are bred by the mining population, who increase their means by rearing this pretty bird. Every German steamer brings about 2,500 birds, and there is an attendant who crosses and cares for these feathered passengers. The loss seems quite trifling, not being more than eight per cent. Mr. Reiche sends canaries to San Francisco, Valparaiso, Lima, and to the whole of South America. Crowded together in a large cage were those

pretty birds, the Rice Bunting. Nothing can be primmer than the appearance of this bird, with its prettily tinted plumage and its white ears. They seem to be fond of each other's society, as they cluster close together on the perches, which rise one above another, huddling together, and looking like so many little ladies, with white caps on, all seated in the boxes of a theatre.

Parrots were in quantity. There was the chattering, social green parrot (*Chrysotis festinus*), a festive "cuss," undoubtedly, and the gray one (*Psittacus erythacus*), rather more demure, scratching his head, and many beautifully colored parrots, all radiant in the most delicately tinted plumage. A pretty bird was the African widow bird, a tiny creature, covered with fine dark feathers, and having a gloriously long tail, dead black, about ten times as long as his body, hanging pendulous from him. Here were English thrushes and bull-finches, with a true Whitechapel look, awaiting purchasers, and gaudy pheasants, the Golden, shining like a bit of jeweler's work, the more quiet Silver, and the demure English pheasant. Here, too, were strange nondescript ducks and a pair of black swans, and last, but not least, a magnificent specimen of the crowned pigeon, (*Guara coronata*). This bird, the most glorious of the pigeon tribe, is of a delectable blue, is as large almost as a peacock, and has his head surmounted by an aigrette of the finest feathers. He comes from Java, New Guinea, and the Moluccas, and is a royal bird.

How long we might have remained in Mr. Reiche's aviary we do not know, but we were startled by looking through a glass window, when we saw in an amusing way, the living contest of the Laocoon repeated, only in this case it was a row between one of Mr. Reiche's men and an alligator. His Uglyship, all mouth and squirming tail, was refusing (and with a great show of reason and good sense on his part) to be placed in a wooden, coffin-like looking box. Though his destination was Europe, and his passage had been taken, he was vigorously protesting against expatriation, and asserting the right of a true born American. How he squirmed and wriggled, and he had to be pinned down to the ground with a wooden fork, before the stout German could induce him to enter his travelling apartment, and at last, when inveigled in as far as head and body went, how he lashed his tail outside, and hissed, snapped, and spluttered.

"We are always sending alligators abroad, to amateurs and zoological societies. Neat creatures for certain kinds of aquariums. Mostly come from Florida, and are easily obtained. I shall ship about a dozen assorted sizes abroad this month. They will reach their destination in good order." Just as Mr. Reiche had concluded, we were startled by feeling something or somebody inserting what we took to be an arm into our pocket. It was not the monkeys, who were chattering in their cages opposite. Who could it be? Turning around we faced a little elephant, who, with his proboscis, was examining our coat tail pocket. He was a chubby little elephant, about three years old, and was as tame as a dog. At the word of command he hoisted up his trunk, rolled up his lip, and showed his nascent tusks, about an inch beyond the gum. "What is he worth," we asked. "Five thousand dollars, and cheap at that. In a year or two, as he grows, he will add a couple of thousand dollars to his price. Look at my kangaroo—a nice little fellow. He is worth \$75. If he was a great kangaroo \$1,000 would not be out of the way. There is a pen of peccaries, quite tame and gentle, and over there you will see a pair of Japanese hogs."

"How is the lion market?" we asked.

"Quite brisk, though it is at the end of the season. We have four on hand. Prices of animals do not vary much, though it is in the spring, for exhibition purposes, that the real demand sets in. A good African lion, with a full mane, would bring \$5,000. A lioness is not quite so desirable; you may quote her at \$2,500. Tigers—royal Bengals—are always wanted. I have two very fine specimens; cheap at \$5,000."

"How do you procure your stock?" we asked.

"A good many animals are bred abroad in European zoological societies. We buy from them, or exchange with them, and can mostly find what we want in London. But I have a regular set of men employed in Africa to find animals for me. Now here is a letter from a party I have out there, in Cassela, somewhere on the White Nile. They are after hippopotami and ostriches. I could sell all the hippopotami I could get. It is among the most valuable of rare animals. There was a good specimen here some nine years ago, and he was rented out for \$25,000 a year. If my party goes further south they may get for me a giraffe or so. A fair camel-leopard would be worth \$5,000. The head of the party reports to me that Mr. Charles Reiche, on the 15th of June last, was the possessor of quite a coop of ostriches—some fourteen, I believe. Birds of small size are not very expensive. My agent tells me he has bought some for about a dollar—about the price of a chicken in Washington market. The head of the party is a German, and he says they will want a caravan of a hundred camels to bring them out of the desert, with the animals they have caught or purchased. The prices I ask may seem to you high, but you must bear in mind the risk we run. You can't rate the figures on a rhinoceros the same as you would for a horse. It's pretty much of a lottery. Some years ago I must have spent \$25,000 on a single expedition. The head of the party used to draw on me from the middle of Ethiopia £1,000 drafts. I believe he did get quite a number of fine animals together, only he went into the show business himself, on his own account with my animals. The last I heard of him was that he had my caravan in

Australia, and beyond the reach of the law. Then it may be a risky business at times, for this reason. Though you may corner the animal market, yet you may glut it with certain beasts. Some two years ago all the zoological gardens which sell wild beasts, and the African hunters, got long on zebras and gnus, and you couldn't give them away. They were not worth more than donkeys. The market has recovered, however, and zebras are now in fair demand. I have besides that party in Africa another one constantly in South America. They stay about the neighborhood of Para, and pick up pumas, jaguars, tapirs, monkeys, and boas for me. The snake line of business is always good. They are mostly in demand for side show entertainments. A good big snake fetches \$500. I begged and begged for a big one as thick around as my thigh, a fellow who would breakfast on a goat, which I saw abroad this year, and offered \$750 for him, but was refused. Monkeys are always wanted; supply equal to the demand. A show starts out with a dozen of monkeys, happy family, and that kind of thing, and are always losing some of them. The price for monkeys varies. These little fellows," and Mr. Reiche pointed to a cage full, "are worth \$10. There is a \$25 one, and I have got as much as \$750 for one. The showman called him a gorilla—which he was not. But you know these stage people often take names they have no right to. Here are two nice leopards; don't go too near them; they are not to be trusted. Fifteen hundred dollars each is their value fixed on them." Just then something shot past us across the floor, scampered over a bale of hay, and bolted into a corner. Whatever it was it went like a flash. Was it a wildcat? We looked for an elevation to scramble on, to be out of harm's way. Presently up ran two men and made for the corner, and captured the animal after no end of scuffling and fur flying. "You need not be afraid," said Mr. Reiche, quite encouragingly, "it is only an English hare. He will break loose every chance he gets. Now we have him in the cage again; pray notice his eyes; they are just like those of a human being. I imported a dozen for the Central Park last year, and they are doing pretty well. This one goes out to the Park to-morrow. Call here next week and I will show you some elk, and bears, and some whooping cranes, from Nebraska."

"You seem to have a very universal kind of business," we remarked.

"Quite so. It is wonderful how the taste has set in. Of course the bulk of the wild animals goes into the show business. Mr. Barnum has spent millions of dollars in buying animals, and, by the way, he is a man to do business with. Just as likely as not he may come in here to-morrow and spend \$50,000 with me in animals, and think no more about it than an ordinary person would when giving a \$10 bill for a black and tan terrier. But it is not only the show people who buy. There are various zoological societies starting up in various sections of the United States who are commencing to purchase animals. Then many private gentlemen are not only bird fanciers, but want game birds and animals to stock their grounds with. I get orders now from all parts of the Union. The business commenced with a pair of canary birds, and has been developing ever since."

"How would you like to try and get one of those Russian mastodons they say are now ranging about in the Ural mountains?" we inquired.

"Have no faith in them. Don't believe that any creature of that kind exists. If it had, Jamrach, or the firm of C. Reiche & Brother, of New York, and Alfeld, Hanover, would have had them for sale."

Though inclined ourselves to be somewhat speculative, we are forced to declare that Mr. Reiche's argument against the existence of the Siberian mastodon had its weight.

"We have"—continued Mr. Reiche, patting the baby elephant, who in return was affectionately inserting his proboscis between the proprietor's shirt collar and his neck—"we have some very funny correspondents at times. We have letters from all parts of the United States about animals, and offers to sell them to us. A man sees a bear in the woods, and writes us to ask what we will give for him. Now the bear is in the wilds, ranging around, and the man wants to sell him in that way, before he is even trapped. We do business on the principle of not selling your bear skin before your bear is caught."

"That is a sound maxim," we replied. "But, Mr. Reiche, don't your animals escape sometimes?"

"Of course they do, and give us trouble, but we are used to that kind of thing, and use the utmost precaution with the really dangerous animals."

"For instance," we asked, "if those two leopards were to break bonds and range around the City Hall and Printing House Square, it would make quite a sensation, would it not?"

"Something of that kind happened to Jamrach," replied Mr. Reiche. "A tiger broke loose, promenaded London, and gobbled up a little boy. Jamrach went for that tiger with a crowbar, and after quite a lively fight made the tiger drop the boy, and eventually drove the animal back into his den. The child was not hurt."

"What was the sequel?" we inquired.

"Oh, the lawyers got hold of the matter, and Jamrach had to pay some £300 damages, which shows that Jamrach could fight a tiger, but not a lawyer."

—The most appalling case of deafness, outside of an asylum, was that of an old lady who lives just across the street from a navy-yard. The other day they fired a salute of twenty-one guns. The old lady was observed to start and listen as the last gun was fired, and then she exclaimed, "Come in!"

Woodland, Lawn and Garden.

INFLUENCE OF FORESTS ON AIR AND SOIL, AND THEIR CLIMATIC AND HYGIENIC IMPORTANCE.

TO ascertain by actual scientific observation and measurement the influence of forests on the air and soil, and their climatic and hygienic importance, the Bavarian Government instituted at different elevations and in various parts of the kingdom seven forestial and meteorological stations, at each of which, three daily observations are made at two different points, one situated in the middle of a large forest, and the other in the middle of a large field. The results of these observations according to Dr. Ebermayer's report (published by C. Krebs in Aschaffenburg, 1873), proves conclusively the marked influence of forests on the temperature of the soil. In the spring and summer months (March till August), the difference in the temperature of the soil of the forest and of the open field averages 7.24 °F, in the months of September, October and February this difference falls to 2.75 °F, and during winter months to 0. The observations further show, that although the absolute moisture of forest air in the course of a year appears to be hardly greater than that of the open field, it is different as to the relative moisture, for, as the temperature of the air in forests is on the whole lower than that in the open field, the forest air must, with the same absolute moisture, have a greater relative moisture and be nearer its point of saturation; a determinate lowering of temperature will therefore produce in forests a separation of water more readily and in greater quantity, than in the open field.

This difference of relative moisture is much more marked in high land than in low land, corresponding to the increasing values of the difference of temperature between forest and open air as we rise above the sea level; the reason is that the difference of temperature is greater in summer. This relative moisture of forest air in summer, exceeds that of the air in the open field by a greater amount than in the other seasons of the year. The forest thus makes the climate moister, and more so in summer, in the time of vegetation, than in other seasons. The difference of relative moisture between forest air and field air, was in spring, 5.70° in summer, 6.18°, in autumn, 5.22° and in winter, 5.24°.

The greater relative moisture in forest air affects the amount of evaporation. Observations were made of the quantities of water evaporated from free water surface in forests and in the open fields, and it appears that on an annual average, the evaporation is about 2.7 times smaller in forests than in open fields. On comparing seasons, it is nearly four times greater in summer than in winter, but even in winter there was two and one-half times less water evaporated in the former than in the latter. The difference in the amount of evaporation in the warmest and driest months (July and August) between forests and open air was on an average, 290.28 cubic inches of water for one square foot of water surface.

The relative proportion of evaporation, however, does not essentially alter in the several months, as we find that in forests on an average two to three times less water is evaporated than in the open air. This great difference in the amount of evaporation probably arises in great part (besides the difference of temperature, saturation etc.) by the much weaker movement of the wind in forests. Of greater practical interest than the evaporation from a free water surface, is that from the ground. As in many parts of Bavaria and Germany generally, the farmers and citizens of villages have an old privilege to gather from the forests dry leaves for littering and manuring purposes, not only forest and open field were compared with each other, but also the influence of such litter covering was examined. The forest alone deprived of its litter covering, diminishes the evaporation of ground water, as compared with that of the open field, about 62°; with litter covering the evaporation was further diminished about 22°. In reference to the question "What influence have forests on the quantity of rain in a country, and do they favor the formation of rain or not?" Ebermayer's observations lead him to affirm that in plains of the same general character, the influence of forests on the quantity of rain is very small, and that it has also no marked influence on the percentage of distribution of rain. With elevations above the sea level, the importance of the forests as regards influence on the rain quantity increases. On mountains it has a higher value than on plains. In the summer season the action of the forest on the rain quantity is much greater in the winter. If we compare the rain fall on one square foot of surface with the quantity of water evaporated from an equal free water surface in the forests and in the open field, it appears that everywhere the annual rain fall is greater than the evaporation. The higher the place is, the greater is the excess of rain and snow water over the quantity evaporated. In the interior of a forest the evaporation is so small, that a much larger quantity of water enters into the soil, than is dissipated by evaporation. In the open field most water penetrates the ground in the winter, next during spring and autumn, and least in summer. In summer the quantity of water which passed through the ground was at one foot depth, three and one-half times, at two feet depth, four and one-half times, at four feet depth, seven and one-half times less than in winter.

The forest-covered ground behaves towards water quite differently. In forest ground without litter covering, the quantity of water at one foot depth is greater in winter;

then follows spring; and in autumn and in summer it is nearly equal. In litter covered forest ground the quantity penetrating the ground in all the four seasons was nearly equal. If we compare the forest ground with the open field, the quantity penetrating the former is, in winter less than that penetrating the latter. In spring the forest ground at four feet deep gave per three square feet surface about 133.42 cubic inches more water than the unwooded ground. In summer litter covered forest ground gave at six feet depth 1245.71 cubic inches more water per three square feet, than the ground in the open field, while in forest ground without litter, at one foot depth twice as much water passed through as in the open field. In autumn, lastly, the penetrating quantities of water in the forest and in the open field were nearly equal.

The action of the forest and of litter covering on the water contents of the ground and of the humidity of a region is thus most marked in the warmest season, and in hot countries. The forest produces an equable distribution of the ground moisture in the several seasons of the year.

In a hygienic point of view, it has been shown that in fever and malaria, contagion is generally carried and communicated by currents of air, but that forests often act as a protection against them. It was observed that in many localities in India which formerly were free of contagious diseases, these appeared after cutting down of the surrounding forests.

CHAS. PLAGGI.

TREE-PLANTING.

A PROVERB of Northwest India declares that three things make a man to be truly a man—to have a son born to him, to dig a well, and to plant a tree. It is impossible for the untraveled Englishman to realize the misery of a treeless country. Europe has no natural deficiency of trees; hence, bridge-building took the place of the old Aryan tree-planting, as an act of piety to God, and of duty to the future, in the counsels of the early Christian teachers of the European nations. Both in East and West, trees were no doubt the first temples, and the planting of groves was the primitive form of church-building. Abraham we are told, planted a grove in Beersheba, to commemorate his solemn covenant; but among his descendants it became in time the mark of a pious ruler to "cut down the groves," as the seats of pagan worship: the mark of a careless ruler to leave them untouched; and the mark of an impious ruler to plant and dedicate new groves. It is not hard to find reasons why the grove naturally became the first temple. Men were no doubt impressed by the hoary age of trees compared with the short life of man. A tree was often the center around which each succeeding generation deposited its traditions—a visible bond uniting the departed with the living, and the living with the unborn. The cool, grateful shade of trees was a natural type of the graciousness the worshippers sought for from the power they worshipped—especially in Eastern lands, where shadow is so precious and so exceptional. The yearly new birth and death of their foliage was a national symbol of human life. The darkness and density of the grove, we must add, hid the obscenities and cruelties which belonged to the darker developments of heathen worship.

Tree-planting has retained in Germany longer than elsewhere something of its occult character, binding together religion, nation, and family. In the Vosges, the old German farmers were not allowed to marry until they had done something for the future good of the tribe by planting a stated number of walnut-trees.

The asking of a distinguished guest to plant a tree, is a pleasant way of commemorating a visit. We do not know that it is much used here. In 1852 the oratorian poet, F. W. Faber, was visited at St. Mary's, Sydenham, by Prince Massimo and Cardinal Wiseman, each of whom left behind him the record of his visit in a tree of his own planting. According to the German fancy, no tree planted as a memorial will grow and flourish unless it has a motto given it at the time of its planting.

In different parts of our country we may come across trees—in Sherwood, indeed, across entire woods—planted to commemorate national events. But our English tree-plantings have long been mainly the work of individuals, and not of communities. A tree planted in Lord Rollo's garden at Duncrub, to commemorate the Union of England and Scotland in 1707, a fir, eighty feet high, and eighteen feet in girth, was blown down in the gale of March, 1866. The greatest day of commemorative tree-planting ever known in England was probably the first anniversary of the Restoration, May 29th, 1661. The letters from different towns in the *Mercurius Publicus* and the *King's Intelligence* of that year, contain accounts of such plantings. Many of these, however, were, like the Trees of Liberty, planted only to last as long as the festival. In one letter from Halesworth, in Suffolk, the "own correspondent" of the period writes: "The number of trees that were planted in the town was so great that it perfectly resembled an artificial forest. The whole town lay under so absolute a disguise that the inhabitants knew not their own houses." (*Mercurius Publicus*, June 6, No. 23.) The wholesale commemorative planting in the Sherwood district marks victories gained by our famous admirals. Lord Newark planted twenty-five acres, partly forest-tree and partly fir, and called it Howe's Grove, in honor of Earl Howe's great victory. A plantation of fifteen acres, adjoining Thoresby Park, is called after Earl St. Vincent; and twelve acres on the north boundary of Budby Forest, celebrate Lord Duncan. In other parts of the Sherwood district great plantations bear the names of Nelson, St. Vincent, Howe, and Spencer—the last in honor of the nobleman who then presided at the admiralty, and to whose judicious arrangement of the fleet the English successes were in part attributed.—*Chambers' Journal*.

LOUIS XVI. A CRACK SPORTSMAN.—From the "Journal de Louis XVI," lately published by M. Nicolardot, it appears that the unfortunate monarch was passionately fond of hunting. Louis XVI., the meekest of mortals, was one of the crack Nimrods. In his diary he records having brought down 189,251 pieces, and 1,274 deer. When large game was in abeyance, he would shoot martlets, squirrels, or small game of any kind. Even swallows were not spared; he averaged seventy a day. An entry of the diary on the 28th July 1784, states, "killed 200 swallows."

Natural History.

"BIRDS WALKING UNDER WATER."

A LATE paragraph in this paper under the above heading, concludes by requesting further observations on the movements of birds under water. The writer assumes that it would be "physically impossible" for a bird to swim horizontally under water, "unless it could in some way assimilate its specific gravity to that of the water around it."

While it is perhaps not surprising that the ability of certain birds to progress under water in all directions should not be generally known, owing to limited and infrequent opportunities of observation, their possession of this power is nevertheless established, and readily explained without recourse to the above-mentioned theory. It is well known to naturalists that cormorants, loons, grebes, and some allied species habitually pursue their prey under water, sometimes at a depth of several fathoms. As their food consists in large part of fish, they must be able to move rapidly in any direction in order to secure it. I have only witnessed the act myself under the most favorable circumstances of observation, in the case of loons; but the mode of progression is essentially similar, if not the same, in other instances. From the stern of a steamer anchored in the quiet, transparent water of the harbor of San Pedro, Southern California, I once watched the movements of some loons which were playing about the vessel without showing any of the wildness these birds usually exhibit. They frequently swam and dived within a few feet of me, and in several instances I could readily trace their course for some distance under water. It was an interesting sight, and a novel one, to see such wary birds disporting heedlessly just below, gliding through the water with the ease and speed of a fish, bespangled and glittering like fishes, too, with the bubbles of air that clung to their sleek, glossy plumage. They appeared to swim in every direction with equal facility, using both wings and legs. But it was not, in reality, so much swimming as flying; the birds actually flew through the water, moving the half-spread wings much as in ordinary aerial flight. They appeared to shape their course with strokes of the broad, webbed feet which projected, rudderlike, far behind, and to propel themselves largely by using the wings like fins; but as both members were in continual motion the amount of impulse derived from each source could not well be estimated. The birds sometimes reached a depth at which they were lost to view, reappearing nearly where they went down; and again, they accomplished the long distances they are well known to swim under water in a horizontal direction, in both cases remaining submerged for the same surprising length of time. It is not in the least probable that they were prepared to swim in this or that particular direction by a change in their specific gravity; it will be evident that no such alteration would be required.

As we all know, a bird dives by pushing itself down with the feet or wings, or both, exactly as it swims on the surface by pushing itself forward; in the former case overcoming, by muscular exertion, its tendency to float, as well as the simple resistance of the water to its progress. Now, to swim horizontally under water the bird need only incline the axis of the body obliquely downward at a certain slight angle, and then push straight forward. For in this position the bird opposes its broad flat back to the obliquely downward action of the water, which offers the required resistance to counteract the tendency to rise, as long as the bird continues to propel itself onward. It could not remain under water motionless; were its course arrested it would immediately begin to rise obliquely backward. The adjustment of the body at an angle which balances the upward tendency with a resistance from above, is of course, instinctively effected, and the direction is altered at will by a change in the inclination of the body. Progress under water is the resultant of three forces—muscular energy, directed forward, specific gravity of the water acting vertically upward, and an induced resistance of the water pressing obliquely downward and backward. A certain rate of speed is required to bring this last force into action, much as "headway" is needed to make a vessel mind the helm; if the motion slacken short of such rate the bird would "make leeway"—that is, drift upward. The principles involved are essentially the same as those upon which a vessel sails up to the wind—the bird trims its boat-shaped body to the water, just as the sails of a vessel are trimmed to the wind.

There is, however, no question that some birds possess the power of altering their specific gravity decidedly—perhaps to the extent of making themselves a little heavier than the same bulk of water. Some of their performances cannot, probably, be otherwise explained. When a grebe, for instance, as is frequently witnessed, sinks back into the water without perceptible move of its flippers, and with scarcely a ripple, until only the head remains visible, the bird has not dived in the ordinary sense of that term. It has neither pulled nor pushed itself under, but just let itself down—sunk; and it is not evident how this could be effected without some increase in specific gravity. On one occasion I happened to see how a great change may be effected. It is simply a matter of a long breath. It is well known that birds breathe air not only into their lungs, but also thence into a system of inter-communicating cells in various parts of the body, the amount thus inhaled and exhaled being, in some cases at least, sufficient to effect the change in question. Holding a wounded grebe in my hands I saw and felt it swell with a long, labored inspiration that seemed to

permeate the whole body, and especially the breast and belly, where a visible ripple passed slowly along puffing out the skin and raising the plumage. It was curious to see this wave advancing slowly to the point of complete distension, and then as gradually recede in the opposite direction until the collapse was total. I should judge that about an eighth of the mean bulk of the body was alternately increased and diminished by this inflation and shrinkage—a difference, perhaps, sufficient for the required change in specific gravity. It is certainly enough to account for the different depths at which a grebe is observed to swim on the surface, sometimes resting almost out of water, and again sinking until the back becomes, as the writer aptly says, "barely awash."

But the amount of air a bird may take under water cannot be presented to determine its subsequent course. When a loon starts after a fish he cannot foreknow the direction of pursuit and take a stock of air accordingly. If his course depend upon assimilation of his specific gravity by this means, he would be foiled in pursuit as often as the fish went the wrong way for him. If, for instance, he let out air enough to sink himself he could not rise or go horizontally without effort, and consequently diminished speed; for obviously he has no way of lightening himself with additional air. Besides, it appears improbable that an animal in which the respiration and circulation are so active as they are in birds, could remain for so long a time submerged without a considerable supply of air. I think that the collapsed grebe above instanced could not, in that state, have performed one of its ordinary reaches under water.

While I believe that the progress in any direction of birds under water is adequately explained upon the mechanical principles above given, I am far from denying that some slight change in specific gravity may occur, and be effected moreover, independently of respiration by a change in the set of the plumage. By the action of certain cutaneous muscles, a bird's feathers may be collectively raised on end or laid flat, at will; and provided the elevation of the plumage be insufficient to admit water in the interstices, the bird's superficial area would be increased, to the displacement of more water, and consequent lessening of specific gravity; and conversely. The loons I observed looked remarkably compact and trim under water, and probably all birds dive with the plumage very "close hauled."

As for birds actually *walking* under water on the bottom, as they do on land, observations are wanting to show that it ever occurs. Loons and grebes, indeed, can scarcely walk at all anywhere, without trailing on the belly, and this mode of progression under water would be particularly slow, laborious, and disadvantageous. I have no idea that it is ever accomplished. The very remarkable case of the birds of the family *Cinclidae*, or dippers, (near allies of the thrushes) often instanced in point, of birds walking on the bottom of streams, is sufficiently disproven by the observations of Macgillivray, who, in his History of British Birds, explains their movements with his usual fidelity and power of graphic description. They progress with the wings like the birds we have been considering. They are not web-footed and cannot swim, but dip down under the water and *fly* through it, till the bottom is reached. There they go bobbing along, with the head and body diagonally inclined forward and downward, moving the wings incessantly in the effort to keep down. The moment they relax exertion they are borne upward, and sometimes swept several feet down the brawling mountain streams they inhabit.

DR. ELLIOTT COUES, U. S. A.

—Bernard A. Hoopes, Esq., President of the Philadelphia Sportsmen's Club, and one of the members of the new Philadelphia Zoological Society, has sent us the following description of a new species of white hawk, with some beautifully colored plates of both male and female, specimens of which are now in the museum of the Academy of Natural Sciences, Philadelphia:

BUTEO BOREALIS, variety KRIDERII. Pl. 5. Entire head and nape pure white with the exception of a few feathers on each side of the forehead at the base of the upper mandible, which are tipped with dark brown. Cheeks white, with several lines of feathers, narrowly tipped with dark brown, extending down the sides of the neck and a short distance under the wings. Back brown, largely spotted with white, which is the prevailing color of the base of the feathers, some of them are edged with yellowish brown; many of the feathers on the upper part of the back are arrow shaped, or pointed, faintly edged with white. Tail white, with an ochreous tint, darker toward the ends of the two middle feathers, banded with eleven irregular transverse bars of brown, the feathers rounded, or slightly pointed and tipped with white. Throat, breast, and entire under parts pure white, inside of wings the same, first five quills edged with bluish ash. Toes, dark lead color, large. Claws black and strong.

The female does not differ much from the male in the general appearance of the plumage, is considerably larger, as usual with the birds of prey. The back is rather lighter brown, the white spots larger. Tail darker, more of an umber tint on the middle feathers, which are edged with white. The forehead is white, but the feathers of the head and neck are tipped with small lanceolate spots of brown. Under parts entirely white, with fewer spots on the flanks than the male, the tarsi and feet more robust, and of a similar color. *Dimensions:* Male, total length 20½ inches; tail 9 inches. Female, total length 22½ inches; tail 9½ inches.

The above description is made from two specimens, male and female, collected in Winnebago county, Iowa, by Mr. John Krider, of Philadelphia, in September, 1872, and carefully prepared by that gentleman. He mentioned having seen several others, and described them as having the habits and manner of flight common to the buzzard family, and

from their being noticed in the autumn, were possibly migrating from more northern breeding grounds. During a previous visit to the same locality, in 1871, he saw a specimen evidently similar to these, but was unable to secure it. Being informed by residents of the country that the appearance of a "white hawk" there was not an unusual occurrence, he felt confident of ultimately procuring one, and has not been disappointed. Being convinced that it is undescribed, I have named it in honor of the veteran naturalist to whom we are indebted for the discovery.

✓ THE GROWTH OF FISHES.

I SAW, a day or two before I started for the woods, a newspaper article, in which it was stated that "some years ago Prof. Agassiz suggested to George S. Page, of New York, President of the Oquossoc Angling Association, a method of determining approximately the age of the famous Rangely trout, which grows to the weight of seven, eight, and even ten pounds. The mode adopted was to take a small platinum wire, pointed at one end and flattened at the other, and marked at the flat end with the weight and the year. Then insert this wire in the dorsal fin, selecting a mark according with weight and time, and return to the water." It seems that in 1870 fifty trout were caught and marked in this manner and returned to the water. This year, among a lot caught by the artist Moran and some friends, was one marked 1870—weight, half a pound. It weighed nearly 2½ pounds, showing an increase of nearly 1½ pounds in three years, or a little over half a pound a year. Now this may be a very fair test for that particular lake, but the annual growth of fishes depends so much on circumstances that it is impossible to establish a general rule from any local test. The increase of all fishes changes materially, both with abundance of feed and extent of range. A difference arising from kind and abundance of food would be expected, but it is not so easy to see why extent of range should have so marked an effect on size. Yet, you put a trout in a well or small spring, and give it all the food it will eat, and its annual increase is hardly perceptible. But give it wide range and a full supply of food, and it increases rapidly. One might think that its cramped condition in a well by confining its exercise, destroyed its appetite, and so prevented its eating a sufficient quantity to hasten its growth. But we find that fish vary in size according to the size of the sheet of water they are in. This is true of catfish, every one knows, and of pickerel. In this State or New England, take two ponds, only a quarter of a mile apart, and wholly disconnected—the one ten rods in diameter, and the other a half mile, and the pickerel in the latter, though in the same kind of water, and living on the same kind of food, will average nearly double in size those found in the former. I should like some explanation of this well known fact. No man goes to a small pond for large pickerel.

The rapid increase in growth is still more marked, and often something marvelous, when the same fish is transferred to different waters in which is different food; I remember, twenty-eight years ago, when I was at Lake Schroon, on my first trip to the Adirondacks, a party of men brought in a large quantity of pickerel, some of them weighing ten twelve, and one fourteen pounds. The fish had been put in the lake four years before, and an act of Legislature obtained forbidding any fishing in it for four years. The four years having expired the fishing commenced, and the above was the result. Now supposing the largest taken was one of the original number put into the lake; he had increased nearly three pounds a year, or three times his size. This is wonderful. A still more remarkable instance has just occurred here in Long Lake and in the Raquette River. Four years ago, the last time I floated down this wild, beautiful river, no pickerel had ever been seen in it. Now it is absolutely swarming with them. They crowd it so that I verily believe a good fisherman might half fill his boat on a good day. The change has come about in this way. Five years ago some men put thirteen pickerel in Long Lake, much to the disgust of the colonists there, who feared they would destroy the trout, as they doubtless will. That very winter four of the number were caught through the ice, leaving only nine to stock the lake and river. This year, or four years from the time they began breeding, the lake is found to be full of them, and the Raquette River also for 130 or 140 miles, clear to Potsdam. The original nine fish averaged about a pound in weight. This summer they take them weighing from two to twelve pounds. The other day a son of my old Indian friend, Mitchell Sabbatis, a boy only nine years old, took one weighing seventeen pounds, or fully as long as himself. The fish towed him half across the lake, and how the little fellow managed to capture him is surprising. None but a young Indian could have done it; but he would have stuck to him till he was dragged overboard, and, I have no doubt, even after. Now, granting this to have been one of the original nine, he had increased about four times his size every year for four years. Others may have heard of such rapid growth before, but I never have. In four years those nine pickerel have stocked to repletion Long Lake, fourteen miles long, and Raquette River for over 100 miles, and Trapper Lake and several small ponds, till millions apparently swarm in them. At first sight, the increase in numbers may seem quite as marvelous as the increase in size, but on reflection it is not. It is doubtless owing to the fact that for some cause the spawn escaped the destruction that usually overtake it. The pickerel, one of the most voracious of fishes, eats its own young in immense numbers, but the abundance of better food in these waters, especially such delicate morsels as young trout, would prevent this, and hence a greater proportion reach maturity. Now I do not know how many thousand eggs are in pickerel weighing a pound, but there are more than one thousand. Supposing a fraction of these, say one hundred, reaches maturity, that would give from the nine pickerel nine hundred saved. The same ratio in four years, would show the sum total of ninety millions—a number large enough to stock many a hundred miles of water. If the ratio saved was larger the number would be proportionably increased. But with the increase of the size of the fish, the number of spawn would be doubled and tripled, so that the result would be still more astonishing. The fact is that the number of fishes that usually reach maturity in proportion to the eggs laid is infinitesimally small.—*New York Tribune.*

THE MUSCULAR STRENGTH OF INSECTS.

THERE is no phase of life, however simple or complex, but furnishes food for profound study. There is no study connected with existence, but affords lessons of absorbing interest, and embodies suggestions of a most valuable character. Human life is a mist incessantly evolving perplexing issues, while animal life as contradistinguished from that of rational beings, is not only constantly inviting science to solve its problematic points, but eliciting the tests of experimental philosophy, to compass the strange workings of its hidden nature.

In the last number of the *Eclectic* there appears interspersed among varieties from *Chambers' Journal* some singular disclosures, touching the muscular power of insects. It seems that one Felix Plateau, a young Belgian naturalist, a son of the distinguished physician, has been recently engaged in some delicate experiments with the view of testing the muscular development of insects, as has been done on previous occasions, with the man and the horse. It may not be generally known that the strength of the last two has been determined through the agency of a machine, technically called a dynamometer, the tension of a spring is counterpoised by an effort exercised for a very short time. Strange as it may sound it is alleged that man has a power of traction equal to five-sixths of his weight, while the horse can only claim the half, or two-thirds of his weight. And yet it is demonstrated that both of these tractive powers are insignificant in comparison with the strength of insects, many of which can draw forty times that amount. The ingenious method of experiment adopted by M. Plateau, as authentically announced, is worthy of the subtle conception that entertained the idea of ferreting out the latent capabilities of insects, and the success that crowned his patient and persistent labors. It is said that he literally harnessed the insect, by a horizontal thread which he passed over a light, moveable pulley, to which he attached a balance, loaded with a few grains of sand. To prevent the insect from turning aside, he forced it to walk between two bars of glass on a board covered with muslin, in order to effect a rough surface. Stimulating it forward, he gradually poured fresh sand into the balance, until it refused to advance further. The sand and the insect were then weighed, and the experiment repeated several times in order to ascertain the greatest effort each could possibly make. The tabular results showed the greatest degree of strength in the lightest and smallest insects, or in more scientific language, that the relative force is in inverse ratio to the weight. The strongest insect proved to be those more familiar, peradventure, to the naturalist, described as living mainly on lilies and roses, and known to scientists as *crioceris* and *trichies*. These tiny beings drew a weight forty times in excess of their own, and one, which would be regarded in the arena as the giant of the entomological group, drew sixty-seven times its own weight. A small beetle, it is related, has achieved the same feat. But the most remarkable fact the writer relates is of a horn-beetle, which actually held between its mandibles, alternately raising and lowering its head and breast, a rod of thirty centimeters length, weighing four hundred grammes, its own weight being but two grammes.

Thus it will seen that insects are superior to the larger animals in the strength of their muscles, and that the law determining their relative muscular development is equally applicable to experiments in flying and pushing as well as in drawing. To conclude, we may add to their powers of traction their skill and ingenuity in devising means for overcoming obstacles, and illustrate the same by an incident narrated by the reviewer. A small wasp was once attempting to raise a caterpillar, which it had just destroyed. The caterpillar was five or six times heavier than its conqueror. Six consecutive times, weary and despondent at its failure to consummate its end, it abandoned its prey. At last an idea seemed to flash upon its mind. It returned, placed itself across the caterpillar, as if on horseback, with its own middle feet it embraced its victim's body, raised it against its breast, and contrived to walk on the fore feet which were at liberty. Thus it soon crossed a walk of six feet wide and laid its prey against a wall.

UNIFICATION OF MANKIND. All the various races of the world are now drawing near and assimilating of their own accord. Fashion has been the forerunner in this extraordinary and significant movement. It is sufficient to make us pause, when we reflect that the tailor has done more toward the unification of mankind than Alexander, and the latter has woven a bond of union among them which is of adamant in comparison to that which the Cæsars forged. The pantalons and dress-coat may be seen as frequently in Constantinople now, as in Paris or London. Even the *fez* is slowly receding before the inevitable stove-pipe hat. It is not unusual now to have the Bedouin ride down upon you in jack-boots and slouched hat. Even the Kirgheez of the Steppes are not indifferent to black frock-coats.

Nor is it in the matter of clothes alone that the world is being unified. There is a demand among civilized nations for a universal coinage. It is felt that there is no necessity for the many brokers, who with much profit to themselves furnish the money of one country for that of another. As gold and silver is the universal medium of exchange, why shall not all nations coin their money in denominations of equal value? In like manner there is a want felt of a universal postal law, under which letters can be sent everywhere for equal charges. And upon the top of all we have a scheme for a sort of Olympian Bench which shall hereafter decide all questions of international law that may arise among nations.—*Overland, Monthly for October.*

ANIMALS FAR UP NORTH.—The Hall expedition in reaching the extreme northern latitude of 82°, the highest ever attained on land, during the month of May sent out hunting parties. Twenty-eight musk cattle were killed, also hares and birds. This, we think is the furthest north, on our continent, that animals have been seen and killed.

—The buckwheat season approaches when the head of the family eats fourteen cakes at a sitting, to the unbounded satisfaction of himself, and to the unmitigated disgust of the oldest boy, who cripples his digestive apparatus for life in a vain attempt to do the same.

—The mean man who is honestly entitled to what monument is due the champion, is he of Slawson, who instead of smoothing the dying pillow of his father, took it from the bed that he might use the case for chesnuts.

Athletic Pastimes.

—If the price of peaches was a mountain, there would be snow on the top of it.

HAY FEVER AND ASTHMA.—In a late number of the *Lancet* some peculiar observations are recorded of this unpleasant ailment, and of its affinity to the milder forms of asthma. Bronchial inflammation is in most cases the cause of an attack, but at the same time, as the following remarks prove, there are some individuals whose temperament is so highly sensitive as to be affected even by the smell of animals:—"In some rare instances the attack may, according to Dr. Salter, be induced by the smell of certain animals, as dogs, cats, hares, and even sheep and horses. Among the remarkable examples he gives is one of a circus proprietor, who was always affected with asthma in the presence of horses, until having made his fortune he retired, and found that, with the relinquishment of his business, he had happily taken leave of his troublesome complaint, which, however, always returned if he visited the stables. Another instance was that an American gentleman, who was always affected by the presence of dogs or cats, and could even detect that they had passed through a room by the state of his breathing on entering it. A third case was that of a country clergyman, who was rendered asthmatic by the neighbor- of a hare or hareskin. This peculiarity converted him into a remarkably keen gamekeeper, for if he met any of his

ANALIS J.—The bird you refer to is the Darter (*Plotus anhinga*). We have seen them killed on the Savannah river, and they are frequently met with in Florida. They are remarkable for the noiseless way in which they plunge into the water, making no more splash than would an eel on entering into its natural element.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company,

103 FULTON STREET, NEW YORK.

Terms, Five Dollars a Year, Strictly in Advance.

A discount of twenty per cent. for five copies and upwards. Any person sending us two subscriptions and Ten Dollars will receive a copy of Hallock's "Fishing Tourist," postage free.

Advertising Rates.

In regular advertising columns, nonpareil type, 12 lines to the inch, 25 cents per line. Advertisements on outside page, 40 cents per line. Reading notices, 50 cents per line. Advertisements in double column 25 per cent. extra. Where advertisements are inserted over 1 month, a discount of 10 per cent. will be made; over three months, 20 per cent; over six months, 30 per cent.

NEW YORK, THURSDAY, OCT. 16, 1873.

To Correspondents.

All communications whatever, whether relating to business or literary correspondence, must be addressed to THE FOREST AND STREAM PUBLISHING COMPANY. Personal letters only, to the Manager.

All communications intended for publication must be accompanied with real name, as a guaranty of good faith. Names will not be published if objection be made. No anonymous contributions will be regarded.

Articles relating to any topic within the scope of this paper are solicited. We cannot promise to return rejected manuscripts.

Ladies are especially invited to use our columns, which will be prepared with careful reference to their perusal and instruction.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions, as it is the aim of this paper to become a medium of useful and reliable information between gentlemen sportsmen from one end of the country to the other; and they will find our columns a desirable medium for advertising announcements.

The Publishers of FOREST AND STREAM aim to merit and secure the patronage and countenance of that portion of the community whose refined intelligence enables them to properly appreciate and enjoy all that is beautiful in Nature. It will pander to no depraved tastes, nor pervert the legitimate sports of land and water to those base uses which always tend to make them unpopular with the virtuous and good. No advertisement or business notice of an immoral character will be received on any terms; and nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for the dereliction of the mail service, if money remitted to us is lost.

This paper sent gratuitously to all contributors.

Advertisements should be sent in by Saturday of each week, if possible. CHARLES HALLOCK, Managing Editor.

OCEAN YACHTING.

PREVIOUS to the ocean regattas of the New York Yacht Squadron, the journals of the country were filled with unpleasant allusions to the yachtsmen as fair weather sailors and dandies. Now we have always maintained that there is a certain proper discretion to be used even in the most daring enterprises, as in this case, of the contest between the Meta and Vision. We hold that the Vision was perfectly justified, and showed discreet and good judgment under the circumstances in not sailing over the course, with eminent danger staring her in the face. The owner and sailing master are always, or ought to be, the best judges whether to continue on the course or return. As it was, fortunately enough there was no material accident; but most of the Meta's friends were sadly alarmed, and many were the anxious inquiries at the different telegraph stations for news of the Meta. Yach sailing over a course of some 300 miles out at sea, as in the late ocean regatta (two of the same yachts will most probably sail over the course for a cup to-morrow) is no child's or man's play. It must be observed that cruising and racing are totally different, as when a gentleman takes his friends on a cruise he has his ordinary sails set, and takes his time and matters leisurely; but where honor, pride and purse are at stake, he crowds on all sail to the utmost limit and runs every risk. Most of the owners of yachts have been accustomed to sail boats from their youth upwards, but it must be borne in mind that for several months in the year the yachts are laid up, and the owners are otherwise employed. Not so with the sailor, who is ever on the water, summer and winter, rough or smooth, making this roving life his profession. It therefore requires considerable time in the

summer before the yacht owners can bring their minds to sailing on a lee shore, with a gale of wind blowing in their teeth—a thing never accomplished unless by mail boats or on a matter of life or death. Hence it behooves all men to acknowledge at once the splendid exhibition of skill, manliness, gallantry and general seamanship which we have just witnessed on the part of the yachtsmen, and to make the *amende honorable* forthwith.

FIRST ANNUAL PRIZE MATCH AT CREEDMOOR.

IN honorable rivalry there were assembled on Wednesday, Thursday, Friday and Saturday last, at Creedmoor, the Regulars, members of the National Guard, sportsmen and sharpshooters, contending for the prizes of the first National Rifle Match ever held in the United States. From this most fortunate inauguration of the rifle movement, which took place last week, we can hope for the fullest success of the Creedmoor range. Next year it will undoubtedly call forth marksmen from England, and the best Wimbledon teams will be pitted against our own men. Our people are quick to learn, and there is no doubt but that they will soon gain not only zest for this admirable sport, but will be among the most skillful riflemen.

The creation of the range at Creedmoor, in such a short space of time, and the excellent manner in which the matches were conducted deserve the greatest praise. In our columns will be found a full and complete account of the history of Creedmoor and of the match, together with the scores, list of prizes, name of winners, analysis, &c., to which we refer our readers.

X DESTRUCTION OF BUFFALO.

OUR Denver (Colorado) correspondent alludes with much feeling to the wanton waste of animal life and food in the Far West, especially of the buffalo, which are slaughtered for their skins by the hundred thousand, and left to rot in their tracks. A skin is worth only \$1.25, while the carcass of an average weight of 1,000 pounds, and worth at five cents a pound, fifty dollars, is cast aside to gorge the coyotes and buzzards. These facts are by no means new. They have been published and reprinted dozens of times. But it may be a matter of news even to the inhabitants of Colorado themselves to be informed that there is a territorial game law, approved February 9th, 1872, which if enforced would promptly meet the necessities of the case, and prevent forever this wholesale waste and destruction. We quote:

"SEC. 6th. Hereafter when any buffalo, elk, deer, antelope, or any other fourfooted game, shall be killed by anyone, such person or persons shall not leave any edible portion of such game so killed to waste, but shall take care of and preserve or bring into market each and all parts of such game that are edible."

The penalty for violation of this section is twenty-five dollars for each offense. It is apparent therefore that for the paltry gain of one dollar and a half these vandals are willing to forego the market advantage of fifty dollars additional, and to risk the payment of twenty-five dollars fine. We don't perceive by what business rules of speculation the ultimate profit accrues.

Now it may be urged in extenuation of the hunters that it would not pay to carry the meat to market; and in behalf of the Territorial officials that it would be impossible to enforce this law in a country of such vast extent, and so sparsely populated as Colorado. In isolated cases it would be, but as a rule the locality of the buffalo ranges, the personnel of every party organized to hunt, and the time of their going forth, are as well known as any other plain facts within human observation; and we maintain that it is entirely owing to the laxity and leniency of the constituted authorities that prosecutions are not pressed. Tens of thousands of buffalo cannot be slaughtered in a single battue without somebody becoming cognizant of the fact. It would not be difficult to employ detectives to attach themselves, in some cases, to the larger hunting parties, and in others to follow and observe the violators of the law. Proof, then, would not be wanting to convict the guilty, and future parties would be deterred from like offences by the fear of espionage upon their organization and practices. The hunters themselves would be brought in time to see the present advantages that they now deliberately and foolishly throw away, and the prospective loss that must ensue from their reckless destruction of valuable life.

As to the facilities for carrying meat to markets, well, it is much less trouble to transport the carcasses of dead buffalo than to herd, fatten, and drive live cattle, through long months of risk and exposure, to the nearest market. It well repays those parties who send occasional carcasses of buffalo to the markets of the eastern States for consumption, and where profit can be made to accrue, appliances are never wanting to "pan it out." When the Indians "make meat," that is, dry their buffalo beef for their winter supplies, they find no difficulty to transport it; and now certainly, with the facilities of a great arterial railway running through some of the buffalo ranges, and approximating others, it need not be pleaded that the hunters cannot bring the carcasses to market with profit. Old bull-beef might be left to the wolves and carrion eaters, and the territorial law should be so modified as not to apply to the tough and indigestible viands; but even of the most ancient patriarch the tongue is always available, and perhaps some portion also of the hump-rib and tenderloin. Were all the meat now wasted to be utilized it would add very abundantly to our food supply, and, as in the case of horse flesh in France, would be eaten in great quantities by those

classes who cannot afford to buy domestic beef. And how much superior it would be to the horseflesh of France! We believe that a company could be organized with comparatively small capital and make it profitable to gather, pack, dry, or otherwise secure the meat "thrown cold" by the pelt-hunters. By these means a very considerable amount of the meat would be saved, and the objects of the game laws be accomplished by the ratio just so much.

HUMBOLDT AS A CONVERSATIONALIST

THE author of Cosmos, whose inner life is only now being understood, must have been the possessor of wonderful conversational powers. His life was evidently a dual one. If illustrious as an acute, deep thinker, his mind ever on the stretch to unravel nature and her secrets, he was at the same time one of the most brilliant of talkers, and delighted to throw aside his absorbing studies, and to mingle with the most polished society of the French and German capitals.

Mr. Hayward, known to the many readers of Faust, as Goethe's best translator, mentions an anecdote of Humboldt as a frequenter of a *salon*, which though not exactly complimentary to human nature, has no end of point and cleverness about it. Gerard, the famous French painter, celebrated for the galaxy of talent which graced his drawing-room, among whom were Madame de Stael, Tallyrand, Rossini, Cuvier, and De Vegny, was telling a story about a certain artist in Florence who had been called upon to paint a picture of Hymen. The person who gave the order was on the eve of marriage to a beautiful woman, and his conception of what the allegorical Hymen should be, was quite rapturous. It had to be painted before his marriage day. The artist worked with a will and produced a wonderful picture. It did not satisfy, however, the expectations of the young man; it did not have fire nor beauty enough. It must be remodeled. The artist, a patient man, promised to rework it, but mentally determined not to touch what he thought was his masterpiece. Some months elapsed before the enamored man came for his picture. On seeing it he seemed disappointed. "Your Hymen I do not think you have improved; if anything, it has an expression of over-beaming joy which is by no means natural." "Sir," replied the painter, laughing, "it is not my picture which has changed, but your feelings. Some months ago you were in love, now you are married." This may be taken as quite a pretty example of true French *badinage*, and accordingly a murmur of applause was heard in the *salon*. "And do you know what happened afterwards?" asked some one. Every eye was turned on the new speaker. "The painter, content with the price he had received, promised to represent Hymen so as to please both lovers and husbands, and after some months opened his rooms for the exhibition of a masterpiece. The public came, but only a few were admitted at a time. The picture was placed in a long gallery, and quite at the end. The effect of the colors was so contrived as to render the portrait of Hymen appear charming to those who saw it from a distance, but seen close, it was no longer the same, and nothing that had charmed was discovered in it." This ingenious and improvised continuation was duly applauded, not the less when the narrator stood confessed as one of the royalties of science, Alexander Von Humboldt.

SCIENCE IN CALIFORNIA.

IT is amazing to notice the vast strides California is making in education. Not only is her public school system admirable of its kind, but the efforts she is making to found and establish higher seats of learning, is beyond all praise. Her University of California, now installed at Berkeley, gives excellent promise of future usefulness, and in the composition of the Faculty we notice many names quite distinguished in chemistry, astronomy, and natural science. California is even producing books, which show the drift of an intellectual activity. Possessing, as she does, animals, birds, fishes, and plants which are but little known to us on this side of the continent, with the same wonderful comprehensiveness she has displayed in working up her material resources, she is developing all her scientific treasures. The "marine mammals of the north western coast of North America," is a book California proposes presenting to us shortly, which will give us an insight into a subject which has never yet been thoroughly treated. It is not alone by her schools and books that this wonderful material, social, and literary progress is manifested, but San Francisco is absolutely surpassing us here in New York, in giving her citizens the opportunity to study nature in a practical way. In San Francisco they have an aquarium; and not only is it a very large one, but it is admirably stocked. We copy the following from the *Weekly Alta*:—

"The aquarium building at Woodward's Gardens is situated between the sea pond and the entrance from the gardens to the amphitheatre. The upper story is used as a picture gallery. The arrangement for the tanks beneath is very simple. They are sixteen in number, raised on each side so that one side of each tank is on a level with a man's shoulder. A person passing through this lower apartment sees on each side of him, as it were, sections of the sea containing marine life. The side of the tank toward him is glass, the water is open to the sunlight above, and no light can reach the passage way, except by first passing through the water in the tanks and the glass fronts. The tanks are made of Frear stone. The water for the marine fish is brought from the deep sea, near the Farallones, where it is found clear as crystal. It is kept constantly in motion, and aerated by the falling of a stream. This work has
